[para1] HOWDEN J.:-- This action arose out of the ignorance and errors of novice owner-builders from whom inexperienced first-time buyers purchased a home and the extent to which they may look to the local municipality for recovery or contribution. The defendants Correne and Robert Larosee apparently built the home for their own occupancy in 1990 on a lot they purchased in the mostly rural Township of Lake of Bays. By 1992, employment circumstances for Mr. Larosee had altered. They decided to sell the home and move south with their children to the Toronto area where he had obtained a job. The plaintiffs Karen and Jeffrey Chapeskie saw it and allege conversations with the Larosees regarding water quality and quantity. The nature and extent of these conversations are in dispute. The Chapeskies purchased the premises after an occupancy permit was obtained from the Township listing only a few of several building permit deficiencies.

[para2] The Plaintiffs allege that, on obtaining possession in October 1992, they found that they had a completely inadequate supply of water and what they had was seriously discoloured. They say they were led to believe the water supply and quality was quite suitable and adequate for a household. There was a dug well on site. They later found that no weeping tile had been installed, and they allege lack of required basement insulation and defects in the fill over the septic tank and in the footings and foundation. They claim damages to remedy these problems from the Larosees for negligent misrepresentation and negligence in the building of the house and from the Township for negligent inspection of the home and negligent misrepresentation in issuing the occupancy permit.

[para3] The defendants Robert and Correne Larosee had never built a home before this. Their position is that they relied on the Township's Building Inspector and his directions, oral and written, with which they allege compliance in building the home. They deny making any misrepresentation or that there were serious deficiencies respecting the water supply. They allege that a filtration system installed by Mr. Larosee had corrected any odour or bacterial issues with the water. They sold the property, containing a house with some trim and flooring in a visibly incomplete condition, on an 'as is' basis, without an express term to that effect in the agreement; they allege that the plaintiffs bought what they agreed to as a matter of contract and were contributorily negligent respecting the claims in tort. To the extent the Larosees are found liable to the plaintiffs, they look to the Township for contribution and indemnity.

[para4] The defendant Township alleges misrepresentation by Mr. and Mrs. Larosee in showing a local contractor as the builder on the application for permit as well as failure by them to request all necessary inspections before occupying and selling the property without the correct inspection permits. The Township denies any negligence on its part. It alleges that the plaintiffs themselves, in buying a home whose quality of work is poor and in obtaining inadequate real-estate and legal advice, as well as the builder-vendors are to blame for any damage that may be proven to have been caused to the

plaintiffs.

[para5] It was agreed at the outset that the Township is not responsible for any defect regarding the well and water supply or the adequacy of the septic systems. In regard to any damages sought by the plaintiffs for those items, they are sought only against Mr. and Mrs. Larosee. And in respect of the septic system, the plaintiffs seek only damages sufficient to provide some fill which is said to be required over the septic area.

[para6] At the end of argument, counsel for the plaintiff set out the subjects for which damages are sought. With the amounts claimed through their witnesses, they are:

A(i) Repair of footings and foundation (by replacement of footings directly on bedrock and installation of weeping tile)

$18,800.00

(ii) Plaintiffs' claimed expenses and disbursements re footings, foundation and weeping tile.

$5,747.35

B. Installation of insulation - basement walls or ceiling.

$1,680.00

C. Drilled well and plaintiffs' claimed expenses and disbursements on account of water deficiencies.

$12,203.87

D. Fill and grading over septic system.

$3,694.00

E. General damages claimed for hardship due to lack of water October 1992 to August 1993.

$100,000.00 [See Note 1 below]

Note 1: Amount is taken from the statement of claim.

[para7] The separation of the plaintiffs' expenses lists into the above items A(ii), C, and D was submitted to me by counsel for the plaintiffs following the trial, with the concurrence of counsel for the defendants. I thank counsel for their assistance in classifying these expenses. The quantum of damages in all categories remains in dispute

[para8] Mr. and Mrs. Larosee bought the lot in question in June 1990. Both testified that they intended it for residential development. Neither had lived in Muskoka or a rural area in their adult lives (though Mrs. Larosee had relatives nearby) and neither had any experience in home construction. The lot is on a township-maintained road, Heney Lake Road, near the hamlet of Baysville. They testified that they originally thought of erecting a prefabricated dwelling; after discussion with Mrs. Larosee's uncle, a local building contractor named Barry Walsh, they decided to build their own home.

[para9] Their testimony parted for the first time on the subject of the identity of the actual building contractor on this job. When Mrs. Larosee applied for the building permit, she named the contractor as her uncle, 'Barry Walsh', on the application filed with the Township (Exhibit 19). She signed certifying that this item and the rest of the application were true. Under Mr. Morin's cross-examination, she testified later that he actually was the contractor, that he directed the work and arranged the sub-trades. This is clearly contradicted by Mr. Larosee who admitted that he acted as his

own building contractor and by a letter signed by Barry Walsh himself (Exhibit 36) which Mr. Larosee identified. The letter dated April 11, 1994, and written to the building inspector shortly after another Township official had sent a letter requiring remedial work to comply with the Ontario Building Code, states:

"Attn: Mr. Don Huggett

Dear Sir:

I am writing to you in regards to the letter I received Dated March 29/94.
File no - PSP-313.
Stating that I was the building contractor for R. LaRosee.
I was not the contractor for this house.
Yours Sincerely.
Barry Walsh"

He was not called as a witness by Mr. and Mrs. Larosee despite being described as an advisor to them and a person upon whose judgment Mr. Larosee relied.

[para10] Mrs. Larosee admittedly had little to do with the construction and was not often at the site. I find that it was Mr. Larosee who acted as the builder from the start. He drew the plans himself and directed the work on site throughout.

[para11] By August 2, 1990, the Township's Building Inspector, Donald Huggett, made his first inspection. The footings and foundation were already in place by then. No one had requested an inspection of the excavation and footings before the concrete was poured, despite the requirement of such an inspection (By-law 90-29 and Exhibit 37 - Permit Notice). Mr. and Mrs. Larosee say they did not know such an inspection was required. Darby Walsh, who was hired by Mr. Larosee to do the footings and foundation with him, testified that he knew the Township was to be notified of the phases of construction - he held himself out as experienced for years in various sectors of construction in Muskoka. But when he was cross-examined on this point, he merely said that he told someone unnamed about inspections and it was left to Mrs. Larosee to call for them, the person least informed or involved in the actual construction.

[para12] On August 2, 1990, Mr. Huggett noted on his report "weeping tile should be installed around outside of footing to carry ground water to low point on lot". Despite not knowing the named contractor nor the owner and despite not having been called for the pre-pour inspection and despite not being able to see if all of the footings were on rock due to dirt over them and despite the absence of weeping tile normally placed at this stage at the base of the footings, Mr. Huggett testified that he just left his report without checking further. He merely took the word of a backhoe operator (whom he did not know) that it was all on bedrock.

[para13] Building continued and Mr. Huggett's last inspection report on construction phases occurred on August 31, 1990. By then, the house was enclosed. He had viewed the framing, plumbing rough-in, vapour barrier and first-floor insulation on his 3 inspection since August 2nd. He made no note on his August 31st report concerning lack of insulation in the basement; he stated that the vapour barrier was also not sealed round the windows. He also had no note of ever checking to see if the weeping tile had been installed. He said he gives persons building for themselves leeway as most do not sell for 10 years and they would normally fix something which was not correct. Regarding lack of basement insulation, he stated that he told someone it would be checked later.

[para14] Mr. Larosee continued to work on the bungalow until late October 1990 when they moved in with their two children. They requested no final inspection for compliance with the Ontario Building Code (O.B.C.) generally or its occupancy permit requirement. Again, they testified they were not told of this requirement in the Township by-law or the Ontario Building Code Act, section 7. Mr. Huggett said that in the normal course Mrs. Larosee would have received, on her attendance to apply, the permit and the Building Permit Notice in pink plastic wrap for posting at the site (Exhibit 37). This notice sets out all of the required inspections as set

out in the Township's by-law and the obligation of the builder to request them. Mrs. Larosee said she received only the building permit on July 5th. Mr. Larosee testified first he did not recall seeing Exhibit 37, though he said he posted a notice of building permit. Later he stated all he saw was a pink slip wrapped in plastic. Finally, in answering Mr. O'Hagan's cross-examination, he said he had never seen Exhibit 37. Mr. Huggett said he would have noted it if the notice was not posted at the building site. He said it was posted at the site. No occupancy permit was sought or obtained in 1990 by Mr. and Mrs. Larosee before they occupied the home.

[para15] By this time the well had been dug on the lot with the help of Tim Walsh (son of Barry Walsh) who also installed the septic system. As for the well, in July 1993, following complaints by Mr. and Mrs. Chapeskie, the Ministry of Environment listed the following problems (Exhibit 5, letter from S. Sisson, Regional Water Well Inspector):

a) water leaked through the concrete tiles indicating poor tile construction;

b) pipe connection to the well was not properly sealed and was stained;

c) sand and crushed rock had been used to grout the "annular space" - they are "inappropriate" for this purpose;

d) the well was too close to the creek, a source of pollution, and surface water could enter the well;

e) neither Tim Walsh nor Robert Larosee are licensed to construct water wells.

The Ministry letter concluded:

> "The murky and dark water is consistent with problems related to improper material placed around the well tiles or leachate from rotting materials moving through to annular space materials to the well bore
>
> It appears that this water supply was not obtained with the intention of being a potable water source.
>
> It is recommended that this well be properly abandoned ...."

[para16] Mr. Larosee does not dispute these conclusions; he attempted to explain them away by relating that a flood had occurred in this area in the spring of 1993 according to his mother-in-law. No evidence was called to substantiate this explanation. Mr. Larosee also denied that the water had been dark while they lived in the house.

[para17] Regarding the septic installation, Mr. Larosee said that he was there when the inspector came and he passed it. Exhibit 26 contains the Septic Permit dated August 3, 1990, issued by the Ministry of the Environment. It lists several items of work to be completed: backfill, stabilize slope surfaces, finish grading, top soil, sod and seed. Mr. Larosee said he had done these things. He had not advised the Ministry of their completion, and it had not been inspected. He added that the Ministry did not tell him to call back, and the tank was buried, none of it was visible, indicating apparently that that was all he understood there was to it.

[para18] Shortly after occupying the home, Mr. Larosee installed a "Rainfresh" water filter system. He filed a brochure (Exhibit 33). The systems he identified as installed are Nos. 1 and 2, called "1. Dirty Water Solution", and "2. Taste, Odour and Chlorine Solution". No. 3 - the "Bacterial and Cyst Solution" - was never installed. He said that as long as he installed a new filter each time the system became plugged - about every month - the water was clear. This system was installed after Mr. Larosee had a sample of water tested and the result was positive for "total coliform". Both Mr. and Mrs. Larosee mentioned after some questioning, that the water supply would be exhausted sometimes, so they kept the children's baths to every two days and never would do more than 1 load of laundry. Mr. Larosee indicated that this exhaustion of the water supply occurred only three times; to avoid this they not only limited washing and showers but did not flush the toilet every time.

[para19] By the winter of 1991-92, Mrs. Larosee described a situation that was desperate for her. Mr. Larosee had not been able to work regularly. They had to resort to welfare for food assistance, a situation she described as "humiliating". By early 1992, Mr. Larosee was working in Toronto, leaving her alone with the children each week. They decided to list the home in March 1992. By the summer of 1992, they had re-listed it, reducing its price from $119,000 to $90,000. It was then that the only prospective purchasers to respond to the listing since March came to see the property, the plaintiffs.

[para20] Karen Chapeskie and Jeffrey Chapeskie had not purchased a home before this. This was the third property they had looked at and they felt it had sufficient promise to return and look at it a second time with a real-estate agent, Marilyn Walters who had introduced them to this property. They had made some effort to prepare themselves by reading a book on home buying. On this first visit, Mrs. Chapeskie said she asked about the water supply and its adequacy for a household. She said she was told by Mrs. Larosee that there was sufficient water for household purposes and that it was drinkable. On cross-examination by Mr. Roche, she said that she recalled asking Mrs. Larosee if they had ever run out of water and she said no. She could not recall a discussion of water on the second visit though she recalled that water was one of the principal matters they went back to check. Mr. Chapeskie agreed with his wife and the Larosees that there were two visits to inspect the property. He and Mrs. Chapeskie placed them in early August 1992. He recalled on the first visit discussing the well and the quantity and quality of the water with both Larosees and the agent. The Larosees told him that the water was sufficient for household purposes and potable. On the second visit, he recalled, Mr. Larosee answered his question regarding water, saying it was drinkable and sufficient. Mr. Chapeskie said he asked again about water because he was very concerned about the location of the well due to the swampy conditions of part of the property.

[para21] Mrs. Walters confirmed that questions were asked about water of Mrs. Larosee on the first visit and perhaps of Mr. Larosee and that they were probably asked on both visits. She recalled that Mr. Larosee was asked about the water once. She said Mrs. Larosee stated they had lots of water to do laundry and either or both said its quality was not a problem. She recalled that the Larosees' answers were consistently positive and they maintained there were no water problems of any kind.

[para22] Mrs. Chapeskie signed an offer on August 14th it was signed back and the parties agreed to the sale on August 15, 1992. Mrs. Chapeskie retained a lawyer for her and Mr. Chapeskie, as did the Larosees. The Chapeskies said they were aware the house was recently built, that it had been lived in, and that there was some finishing work to be done. They were told that a water sample taken before closing tested acceptably. Prior to closing, Mrs. Chapeskie was told by their lawyer that no occupancy permit had been obtained by the owners. She told the lawyer they wanted one. As a result, on September 15th, Mrs. Larosee wrote to the Township requesting "an inspection" on our home so that I may receive an occupancy permit" and enclosed a $100 cheque for the Township charge. On October 2, 1992, following an inspection by Mr. Huggett, an occupancy permit was issued. (Due to a clerical error it was replaced by a new permit on October 5, 1992, though the date of issue remained October 2, 1992. Exhibit 19 and 45). Mrs. Chapeskie testified that the occupancy permit was conditional and that, as she understood after talking to her lawyer, it meant the house was "okay to occupy" subject to the items listed being done.

[para23] The occupancy permit sets out the address and roll number of the property and then states:

> "Portion of Building Approval for use: complete building ok to occupy - Outstanding work: hanging and trimming of interior doors, exterior siding. Rear door must be kept locked until landing and stairs complete."

Mr. Huggett had filled in this information by hand. Under that, there is a four-line clause stating that use and occupation are permitted of the building "which the applicant

has stated has been constructed in full compliance with all the provisions of the Building Code Act and regulations and orders made thereunder" and the Township laws. At the bottom, there are three boxes, the top labeled "fully complete" and the other two indicating "partially completed" for non-residential and residential occupancy. The bottom box is checked. Beside it are the words:

> "Partially completed and ready for residential occupancy in accordance with Article 2.4.3.2(1) of the Code."

Article 2.4.3.2(1) of the Code of the O.B.C. states:

> "A person may occupy or permit to be occupied a building intended for residential occupancy that has not been fully completed at the date of occupation provided that
>
> (a) the building
>
> (i) is not more than 3 storeys in building height,
>
> (ii) has not more than 1 dwelling unit above another dwelling unit,
>
> (iii) has not more than 2 dwelling units sharing a common means of egress, and
>
> (iv) has no accommodation for tourists,
>
> (b) the following building components and systems are complete and operational:
>
> (i) required exists, handrails and guards, fire alarm and detection systems, and fire separations, and
>
> (ii) water supply, sewage disposal, lighting and heating systems, and
>
> (c) where applicable, the building conforms to Article 2.1.1.8.

[para24] The Chapeskies' lawyer on the purchase, Mr. Huycke, testified that, although he thinks he told them this permit was not an "all-clear" type of document, he was told by a Township Official prior to closing that no work orders or deficiencies were noted as outstanding on this property. He understood the permit to mean that the building inspector had inspected the property and found it fit for occupancy subject to the list of items on it shown as not done. He did not read the article of the Code or explain the final clause to Mrs. Chapeskie. He agreed that a longer list of unfinished items were contained in a letter from him to the vendors' lawyer prior to closing (Exhibit 18 - no siding, no carpeting, 2 interior doors unfinished, no window trim, deck incomplete) and that they were assumed by the purchasers as to be completed by them.

[para25] Mr. and Mrs. Chapeskie completed the purchase and moved into the property on October 16, 1992. At about 4 p.m. that day, Mrs. Chapeskie said she turned on a tap and got a bucket and a half of murky brown water. She said she heard banging, and her husband found the water pump was sucking air. There was virtually no water in the tank. They telephoned their lawyer to report the problem and started to contact well drillers in order to install a drilled well. Several tests showed the water to be problematic or not acceptable as a potable source (Ex.1). They testified that they could not get a new well drilled until August 1993 due to lack of funds and the drillers' refusal to come and work on credit. In the meantime, they purchased water off-site, and though Mr. Chapeskie made efforts to revive the existing well, he ended up having to dismantle the filter system and drilling a well.

[para26] In attempting to connect the new well to the house in 1993, Mr. Chapeskie found that there was no weeping tile to drain the footings. As a result of complaints by the Chapeskies, the building inspector re-attended to inspect the house on December 16, 1993. Mr. Huggett's report of that date notes the lack of weeping tile at the footings level - it had been shown specifically on the Larosees' house plans filed with the Township and no change had ever been sought to the plans as filed. Mr. Huggett listed several other deficiencies

including some interior and exterior work which was assumed by the Chapeskies or that they now accept as their responsibility as listed on the occupancy permit and in the buyer's letter prior to closing. However, Mr. Huggett also found a sump pump installed in a rock pocket in the crawl space of the basement which drained into the sewage line. This confirmed Mr. Larosee's testimony that this was what he and Darby Walsh had done without any consultation with the building inspector in place of the missing weeping tile. Mr. Larosee testified that he had told the inspector of the failure to install it and that he agreed to that. Mr. Huggett said he did not recall such a conversation nor did he authorize the failure to install weeping tile. The foundation drainage was noted as another violation of the Code. Mr. Huggett also noted that "a final inspection would allow the inspector to pick up any further deficiencies". Yet at no time had he told Mr. or Mrs. Larosee at the time of the inspection before granting the occupancy permit in early October 1992 that another inspection was required, nor did the Township tell Mr. Huycke when he inquired regarding deficiencies under the Building Code prior to closing. The Township did not even give a written response to such requests nor apparently had it ever been noted in the Township Building Records when Mr. Huycke inquired in the Fall of 1992 that a final inspection under the Building Code regarding a house built and occupied since 1990 (to the building inspector's knowledge after October 2, 1992) had never been done.

[para27] In any event, on March 29, 1994, the Township sent a letter to Mrs. Chapeskie and to other interested parties including Mr. and Mrs. Larosee. This letter appears to be in the nature of an order to comply, yet it patently is not - an order to comply with the Building Code was issued by Mr. Huggett on March 28, 1994, directed to both Mr. and Mrs. Larosee (as former owners) and to Mr. and Mrs. Chapeskie. The letter directed completion by the contractor Barry Walsh who had been listed on the building permit on the representation of Mrs. Larosee in July 1990. The order directed both the Larosees and Chapeskies as well as Walsh to comply. Both the letter and order listed the following as deficiencies found by Mr. Huggett under the Code.

Insulate foundation walls

Install foundation drainage

Repair joist bridging

Install exterior decks railings

Finish exterior grading covering septic

Sump pump discharge to be installed

[para28] Mr. and Mrs. Larosee replied through their solicitor, denying any liability for the above items or any others not finished on the property. Barry Walsh denied any responsibility as contractor (Exhibit 35). On July 11, 1995, after much trenching work by Mr. Chapeskie around the house to attempt to deal with installation of the missing foundation drainage (weeping tile), Victor Wilcox, an experienced geotechnical engineer was retained for advice. He found that subsidence of part of the house had begun due to lack of a firm base for the easterly part of the dwelling. He located a crack through the outer wall of the foundation, 1" in width at the top and closed at the bottom. He found that about 40' of the south, east and north perimeter of the house rests on unquestionably deficient soil (approximately one-third of the building which is a rectangle i.e. 24' x 48'). Mr. Wilcox said it possessed only one-third of the bearing capability of 75 k Pa soil compression required in the Code. He was able to reach into the sub-soil under the footings to the length of his fingers and palm and found that it was organic soil. He said there was no need to test it with any implements as he could take it out in handfuls. He said he tested under the footings along the entire easterly end of the building. He stated that over one-half of the house rested on rock but the remainder is on organic soil or soil with bearing capacity below the Code's requirement. The crack is located exactly where the rock ends and the soil-base begins and its shape indicated that part of the house was beginning to lean away.

[para29] I will deal with the damages sought for remedial work in more detail later. However, I should refer briefly

now to the evidence of the expert witness called by the plaintiff dealing with Code enforcement and mitigation. In Mr. Mathon's opinion and using Mr. Wilcox's findings, the following are deficiencies under the Building Code which can be mitigated in the following manner.

Deficiency	Remedial Work Required
(a) Lack of insulation in basement	Either install insulation on interior of all foundation walls (if heated) or between ceiling joists (if unheated).
(b) Lack of weeping tile, and interior base for footings and foundation	Removal of footings and replacement with footings resting on bedrock and weeping tile.

[para30] I will now turn to my findings of fact and to the legal principles applicable to the claims regarding first water, and second, footings and foundation drainage and basement insulation and fill over the septic system.

1. Liability in respect of water.

[para31] It is accepted by the parties that the Township owes no duty to the plaintiffs in respect of the well installed by Larosee, or the water quality or in adequacy of water supply to the house. The plaintiffs base their claim for dirty and inadequate water against the owner-builders, Mr. and Mrs. Larosee, in negligence. They allege that they installed the well in a negligent manner and then, in order to induce the plaintiffs to buy the property, they breached their duty of care by carelessly misrepresenting the situation as having been good and problem-free for both quality and quantity of water for normal household needs.

[para32] Mr. and Mrs. Larosees' counsel counters that argument by raising the 'entire contract' clause in the agreement: York Condominium Corp. No. 76 v. Rose Park Wellesley Investments Ltd. 48 O.R. (2d) 455 (O.H.O.). The clause reads: He also argued that the plaintiffs were contributorily negligent in not preparing themselves to purchase in a rural area, and in particular, for failing to insert protective clauses in the agreement to warrant water quality and adequacy. He emphasized Mr. Larosee's evidence that they were warned to exercise care in using the water.

[para33] The law has moved in recent years in recognizing that a duty of care may arise between parties to a contract. In several cases owner-builders have been held liable to purchasers in negligence or breach of statutory duty. Petruzzi v. Coreny, Betts and Township of Beckwith (1991), 7 M.P.L.R. (2d) 183 (Ont. Gen. Div.) Goodwin v. Jakubovskis, July 20, 1995, [1995] O.J. No. 2338. In such actions, where the parties entered a contract but a negligent misrepresentation is made in the pre-contractual setting, it has been held that the injured party may maintain an action based on a duty independent of the contract. Queen v. Coguos, [1993] 1 S.C.R. 87 (S.C.C.), B.C. Hydro and Power Authority v. B.G. Checo International Ltd., [1993] 1 S.C.R. 12 (S.C.C.). In fact, in Checo the contract contained the very representation on which Checo relied in its tort claim. In both cases, recovery in tort was allowed by the Supreme Court of Canada for negligent misrepresentation as the contract failed to expressly exclude liability in tort for the wrong in question.

[para34] The plaintiffs' claim respecting the water issue in this case is now advanced solely on the basis of tort. The 'entire contract' clause does not exclude a claim in tort for negligent misrepresentation. The argument by Mr. Roche based in contract therefore does not assist his clients.

[para35] On the evidence before me, I find that Mr. and Mrs. Larosee had been having significant difficulties with the well and the water supply to this home since its construction. The findings of the Ministry of the Environment (Exhibit 5) as to faulty construction of the well, its location near a source of pollution, the poor water quality, and the need to abandon it as a water source were not seriously disputed by Mr. Larosee. Both Mr. and Mrs. Larosee finally admitted to times

of complete failure of supply and that most of the time they had to keep their water demand abnormally low in order to have at least some left for their daily needs.

[para36] Furthermore, I find that Mr. Larosee's evidence at times was simply not credible on this issue. He refused to admit that the water was ever badly discoloured (as in the photo, Exhibit 20). Yet, at his examination for discovery, he accepted this was so. At one point, he would not agree with his own answer on discovery as to using a mud hen twice to try to increase the water supply. Only when he was told that the reporter could be called to testify as to the transcript's accuracy, he accepted his answer. Additionally, I do not accept his assertion that the 5 gallon jug stored under the sink throughout the Larosees' occupation of the house had only been used to bring in off-site water before the house was built or simply as a mobile water source for him during tree clearance. It appeared to me that it was kept in a convenient place for use in bringing water to the home at times where the on-site supply failed.

[para37] As to the alleged conversations with the plaintiffs, I accept the plaintiffs' evidence and that of the agent, Ms. Walters, that Mr. and Mrs. Larosee clearly misrepresented water adequacy and quality. At one time, Mr. Larosee admitted that one water analysis he had obtained showed a positive result for coliform. They never disclosed this or any of their other water problems to their own agent or to the Chapeskies. The elaborate filtration system never acted to filter out bacteria and was installed for problems the Larosees themselves at times would not admit; yet they made no effort to tell the plaintiffs of their use of this system. I accept that the plaintiffs relied on the Larosees' statements in entering the agreement.

[para38] In making the impugned statements, I find that Mr. and Mrs. Larosee were at least lacking in due care and were reckless as to their truth, given the problems which were part of the history of their occupancy. They had a duty to the plaintiffs to use due care in representing honestly and accurately the on-site water situation and its adequacy in their statements to them and they failed to do so. Moreover I find that they engaged in a recklessness born of a real and heartfelt need to sell this house to the only people in 5 months to look at it, at a time when finances and time together were difficult for this couple. I further find that the plaintiffs relied on the Larosees' blithe statements about the water on both visits to their detriment; they purchased the property having been led to believe the water supply was acceptable for household needs and found on the first day of their occupation of the home that no real and dependable water source existed on this property without the expenditure of a large sum of money to drill a well.

[para39] The required elements of a claim for negligent misrepresentation are:

i) a duty of care existed;

ii) the representation was untrue or misleading;

iii) the representor acted negligently;

iv) the representee relied in a reasonable manner on the representation; and

v) it was relied on to the detriment of the representee. Lakefield (Village) v. Black (1999), 41 O.R. (3d) 741 (Ont. C.A.)

I have found in the plaintiffs' favour on each of these elements. In doing so, wherever the evidence of the plaintiffs and the defendants Mr. and Mrs. Larosee conflicted, I find that the plaintiffs' evidence is to be preferred. I do not find that the plaintiffs contributed to their own loss; they acted reasonably in that Mrs. Chapeskie obtained and read about house-purchasing and they used a local real estate agent to assist in their inspections and purchase. They retained a solicitor to complete the transaction. Even if they obtained express warranties in the agreement, they still had to trust in the credibility of the warrantor which, in this case, for human reasons of need, was a weak reed.

2. Liability for other defects.

[para40] The plaintiffs had raised throughout this law-suit a number of claims beyond those put to me at the end of the evidence. In Mr. Mathon's evidence, the following were raised as defects and were cross-examined on by Mr. Morin:

Ventilation - lack of range fan and bathroom fan

Vapour barrier - not sealed

Framing - poor quality studs

Bridging

Footings and foundation - on organic soil and no drainage

Basement insulation

Well and water inadequacy

Fill over septic - more required

In the statement of claim, a claim was also made for a malady and surgery undergone by Mrs. Chapeskie. This claim was not proceeded with at trial. No argument was advanced on the ventilation, vapour barrier, framing and joist bridging claims, nor were they listed by Mr. Morin as still being claimed, in answer to my questions regarding what items were alleged as the defendants' responsibility. I therefore make no findings in those respects.

[para41] As to the remaining matters claimed as defects under the Ontario Building Code, I make the following findings as to whether they are proven to be defects under the Ontario Building Code and Act.

[para42] The lack of insulation in the basement was discussed by the plaintiffs' expert witness Mr. Mathon as well as by Delir Dehlen, the witness called by the Township who was also qualified to express expert opinions on the Code. Mr. Dehlen said that this was not a traditional basement; rather, it was a work space without interior access to the upper floor. In fact, this level has one area high enough for an adult to stand and work where the furnace and work bench are. The rest is crawl space over a large rock. The 'work area' was installed illegally as the filed plans call for only a crawl space under the bungalow. Mr. Mathon pointed out that the Code requires insulation between heated and unheated spaces (section 9.26.2.3), and as the basement is unheated, insulation is required between the ceiling joists. Mr. Dehlen spoke of another Code section 9.26.4.13(11) which I agree, taken alone, may not require it in the walls. However, I accept Mr. Mathon's conclusion, with which Mr. Huggett agreed in his order to comply, that the lack of insulation in the basement ceiling fails to comply with the Code. Both Mr. Larosee and the plaintiffs indicate it is not a heated space and the floor above is.

[para43] The lack of weeping tile does not comply with the Code, all agree (section 9.14.2.1(1)). Despite the evidence of Mr. Larosee and Darby Walsh regarding the makeshift drainage system which they installed as a substitute, weeping tile was never shown to the building inspector to be unnecessary as section 9.14.2.1(1) requires in order to dispense with it. I accept the findings of Mr. Wilcox that the footings rest partly on rock and partly on soil of less than 75 k PA bearing pressure. Mr. Dehlen stated that if this is the case, the inspector should then deal with it under section 9.4.4 of the Code which requires a specially designed footing according to a table in that subsection and involvement of an engineer. There is no doubt that no such design specifications were ever consulted in this case, because the building inspector was not aware of this condition. I find that the footings were installed without regard for and do not comply with the Ontario Building Code section 9.15.1 and 9.4.4.

[para44] As for fill and grading over the septic system, Mr. Mathon did not express any opinion in that regard concerning the Code. Mr. Dehlen stated merely that the Code requires grading only to slope away from the house and septic bed and that the contractor is to notify the inspector of its completion section 2.4.5.1 and 9.14.6. He said the notification was not done apparently. Mr. Huggett listed

exterior grading on the order to comply. He merely testified that the grading was probably all right but top soil was not put in. The only other mention of fill or grading was a generalized requirement of the Ministry of Environment inspector on the Sewage Permit. Mr. Larosee said he complied with it. No one was called from the Ministry to explain any further fill or grading requirement. Mr. Chapeskie could not say what fill was required and no evidence is before me of its cost. I am unable to find a fill and grading deficiency on this evidence or to assess any remedial work, if any is required. I will therefore go no further on this claim.

[para45] I find that the plaintiffs purchased a house from its builders and owners, containing several conditions not in compliance with the law. It was built subject to a building permit issued by the Township of Lake of Bays, the application and the plans for which were not followed and a key inspection, the first one prior to pouring of the footings to ascertain the base on which they would sit, was not requested by the owner/builders. No recognized contractor was in charge of the work despite the representation in the application to the contrary. It has since been found that the house is structurally in jeopardy due to the instability of soil under part of it. This and the other deficiencies which I have found can be remedied but are the plaintiffs entitled to claim relief?

[para46] I take them at their word that, when Mr. and Mrs. Larosee built the house in 1990, they intended it only for themselves. That does not excuse their failure to even attempt to know the building requirements under the Township's By-law and the Ontario Building Code, because in time the faults would haunt them or anyone to whom they sold eventually. There is no evidence before me to indicate that their defaults, including the naming of her uncle as contractor on the application for permit, stemmed from anything but ignorance. I see no evidence of a plan or scheme to deliberately flout the law.

[para47] The building by-law, Building Code Act and system of inspections place the initial obligation on the builder, in this case the owner/builder, to comply in the construction of the home with their provisions and regulations. Prospective buyers form part of the class of persons to be benefited or assisted by this statutory scheme. It is reasonable that if the law is not complied with, through negligence or otherwise, prospective buyers may be injured. The mere fact that the owner/builder may suppose at the time of building that he or she will live in the house for the foreseeable future alters nothing in regard to the existence of a duty of care. Just as municipalities owe a duty of care when they decide to adopt a system of building inspections to others including owner/builders and prospective buyers, so the owner/builder himself also owes a duty of care to prospective buyers during the construction. Kamloops v. Neilson (1984), 29 C.C.L.T. 97 (S.C.C.); Rothfield v. Manolakos (1989), 63 D.L.R (4th) 449 at 454; Petruzzi v. Coveny (1991), 7 M.P.L.R. (2d) 183 (Ont.G.D.)

[para48] In this case, I find that Mr. and Mrs. Larosee failed to exercise reasonable care in the construction of their home. Mrs. Larosee misled the Township by a careless statement in the application for building permit as to a named contractor actually building the dwelling. They failed to see that the building rested wholly on rock or on soil sufficiently compressed to bear it as required by the Code. In this regard, I note Mr. Larosee's conflicting evidence. He first said the home was built wholly on rock and the footings were on rock. Later he admitted he knew part of it did not rest on rock. He then said he relied on the tradesman he hired, Darby Walsh, for installing the footings. Darby Walsh said one corner of it was built on what he called hard pan. (Hard pan was described by Mr. Wilcox as very hard glacial till, but it softens as the moisture content rises). And Mr. Walsh also said that Mr. Larosee knew perfectly well at the time that a portion of the footings were on soil.

[para49] In failing to indicate this change on the plans filed, or to request the first inspection before the footings were poured (which would have brought this condition to the attention of the inspector as the plans showed it entirely on rock), in failing to obtain engineering advice as to the bearing capacity of the soil or the appropriate design of the footings, and in failing to install the weeping tile to permit proper drainage and prevent moisture content to increase in

the supporting soil, I find that Mr. and Mrs. Larosee breached their duty of care to the plaintiffs. As well, I accept Mr. Huggett's evidence that he did not orally approve the failure the failure to install the weeping tile, as Mr. Larosee claims. I reject Mr. Larosee's evidence on this point. It was Mr. Larosee, after all, who admitted to burning the pipe which he had purchased to act as weeping tile before the plaintiffs came to inspect the property. It is no excuse for a builder, even one who is a novice builder and owner, to say they did not know of the pre-pour inspection or that a final inspection was necessary. I find that they had the building permit notice (Exhibit 37) which they received and posted during the construction. It sets out all of the inspection phases and the obligation on the builder, in this case, Mr. and Mrs. Larosee, to request them at the times indicated. I have noted Mr. Larosee's conflicting evidence again on the point of his knowledge of Exhibit 37, and I simply reject his and his wife's evidence that they did not know of their obligation to request certain inspections. How did they know of the other inspections regarding the completed foundation, framing, plumbing and insulation? In each case, Mr. Larosee called for the inspection as required by the by-law and as shown on Exhibit 37. As to the first and final inspection, it reads:

Stage of Construction	Notice
1. Excavation and footings: Prior to concrete pour	48 hours
6. Final Inspection for Occupancy Permit	48 hours

[para50] I also find that Mr. and Mrs. Larosee were negligent in not installing the basement insulation. I find that Mr. Huggett, in one of the few instances that he tried to impart some helpful information, did tell them that his passing of the insulation referred only to the upper floor and that he would check it later. The fact that a basement existed, even a partial one, was again a deviation by the Larosees from the plans they filed with the Township. It was embarked on by them without any notice or attempt to file new plans which could indicate the further implications of the existence of a basement where persons would occasionally occupy or work instead of the crawl-space which was clearly not intended for human activity.

[para51] In the case of the Township, it is now trite law that once it adopted a system of building inspections, it owed a duty of care to perform those inspections with reasonable care as required by law. Kamloops v. Neilson, Rothfield v. Manolakos, supra. As to the standard of care required, I note the statement of LaForest J. for the majority of the Court in Rothfield, at p. 455:

> "Finally, I do not share the view that applying the law to owner builders in this way would make the municipality an insurer in respect of compliance by the owner with applicable building standards. It must be borne in mind that a municipality, once it has made the policy decision to inspect construction, is not bound to discover every latent defect in a given project, nor every derogation from applicable standards. That would be to hold the municipality to an impossible standard. Rather a municipality is only called upon to show reasonable care in the exercise of its powers of inspection. Accordingly, a municipality, whether the duty of care is owed to an owner builder or a third party, will only incur liability for such defects as it could reasonably be expected to have detected and to have ordered remedied."

The Township's building inspector is to use reasonable care in carrying out his duties of inspection and will only be liable for defects he could reasonably be expected to have detected and to have ordered remedied.

[para52] Mr. Dehlen is a witness who has had considerable experience in Toronto in enforcing the Code. He was also a member of the Building Officials Association which assists in the training of such officials and, until last year, of the Building Code Commission which adjudicates disputes under the Code. He was presented with the hypothetical situation of an inspector who was not notified of the first (excavation and

pre-pour) inspection, who cannot tell visually if the building is on rock, who knows of the contractor named on the application as a recognized builder, who is aware that the plans place the building totally on bedrock, and who first comes to the scene after the site is covered and takes the word of a workman that it is on bedrock. Mr. Dehlen gave his opinion that a reasonable building inspector would consider a number of factors: area topography (most buildings in Muskoka are on rock), the building plans filed, visual ability to see 2/3 of the building seeming to rest on bedrock, the statement of the unknown workman, and the fact of a recognized builder being in charge. He concluded that it was reasonable for the inspector in that situation to assume the remainder of the building was on bedrock. Even if his suspicions were aroused, Mr. Dehlen stated that the Act did not then permit an inspector to issue an 'uncover' order unless he had first made an order prohibiting the cover of part of a building before it had been covered section S.9(1) & (2); and he could not issue an order to comply because he must first find that the Code had been contravened.

[para53] Mr. Mathon, showed familiarity with the Code as an engineering assessor and investigator in the private sector. He is employed now as an assistant building official for the Town of Mattawa. He took a different view from that of Mr. Dehlen. Mr. Mathon stated that the most important inspection is the one prior to installation of footings. The material on which the footings are to be placed is important because a failure under them can lead to an undermining of the foundation. Lack of weeping tile to drain the subsoil can lead to damage to the footings and to the stability of the building as a whole as well as leakage. During cross-examination, he said that the inspector should make clear to a builder the importance of his inspecting the work at the required stages. In inspecting the conditions under the footings, the inspector should carry out a close inspection to ascertain the capability of the sub-grade soil or rock and in doing so, he should inspect closely the entire area under the footings. If the inspector is not satisfied that the sub-grade is suitable, he should not pass it and he should issue an order to comply identifying the problem, and where there is a doubt about the bearing capacity, he should require an engineering report on the soil capacity and quality. Under cross-examination, Mr. Mathon agreed that the issue of bearing pressure of the sub-grade material is a judgment to be made by the building inspector but he should know what to look for. He noted that the Code provisions in this regard and the practice of building inspectors in avoiding organic soil under footings result from years of failures of such sub-standard soil.

[para54] Mr. Huggett's evidence has been summarized earlier. As noted no pre-pour inspection had been called for by the Larosees. He knew that when he came the first time, he got down into the trench, but he admittedly could not see all of the footings/sub-grade interface due to the dirt he described on site. He did not put his hand into the subsoil or do any kind of compression test. He looked only at the north side. Under cross-examination, he said the failure of the owner/builders to notify him in order to make the pre-pour inspection raised no concern. He took it that they simply forgot to call. He admitted that he did not see, let alone closely inspect, all of the subsurface. He said that he could have done a spot-check of the underlying conditions but as he suspected no flaw, he did none. He kept no notes whatsoever of what he did in regard to inspection. He gave no order not to cover the weeping tile when it was installed. And on the next inspection, he made no effort to see if the weeping tile or 'O' pipe had been installed as he directed. He seemed to put store on the fact that the house was being built by or for the intended inhabitants who would automatically see that standards were met.

[para55] The building inspector's duty is to use reasonable care in inspecting and does not extend beyond defects which the inspector could reasonably be expected to have detected and ordered to be remedied. Rothfield v. Manolakos, supra. In that case, Mr. Justice Laforest (for the majority of the Court) noted that most owners must rely on the "disinterested expertise" of a building inspector and are entitled to rely on proper level of care to see that the building conforms to the building standards as set by the local by-laws and the Building Code Act. He stated that while failure to notify the inspector of an on-site inspection

constitutes negligence by the owner/builder, that does not absolve the municipality from liability. When he came to a discussion of the pre-pour inspection, Laforest J. wrote the following (at p. 458):

> "As I noted above, the city issued the building permit on the assumption that an on-site pre-pour inspection would enable it to determine whether the design met applicable standards. The pre-pour inspection is a key part of the inspection process because it permits the inspector to determine if the foundations of a project are up to standard. Lord Wilberforce touches upon this very point in Anns v. Merton London Borough Council, supra, at p. 753:
>
> > 'One of the particular matters within the area of local authority supervision is the foundations of buildings - clearly a matter of vital importance, particularly because this part of the building comes to be covered up as building proceeds. Thus any weakness or inadequacy will create a hidden defect which whoever acquires the building has no means of discovering.'
>
> "Inasmuch as inadequately inspected foundations will always pose a threat to the health or safety of the public, building by-laws contain measures aimed at preventing the occurrence of such 'hidden defects'." (emphasis added)

In this case, the local by-law incorporates the requirements of the Building Code for among other things, bearing capacity of the subsoil. Based on Mr. Wilcox's observations and corroborated by the inspection of Mr. Mathon as to the existence of interior cracks and subsidence, I have found that the subsoil under the easterly portion of the building was organic and deficient.

[para56] On the evidence before me, I find that Mr. Huggett fell below the standard of care required of building inspectors in view of the special importance of the pre-pour inspection. First, he made no attempt to stress to the applicant, Mrs. Larosee, the importance of the inspections. I understand that he was told there was a contractor involved, but he did not know that person or his work and Mrs. Larosee herself exhibited no evidence of knowing building procedures or of her duty as an applicant to see that proper standards were met. Secondly, knowing on his first attendance that the plans were deviated from by the added small basement and that no pre-pour inspection had been called for or done as required and knowing the importance to the integrity of the entire building of the subsurface condition, he failed to inspect or test (with his hand or an implement) all of the footings' bed and merely took the word of a stranger on-site that it was entirely on bed-rock. He failed therefore to note that approximately one-third of it was on substandard soil, and to issue an order to comply or revoke the permit until he received satisfactory evidence of its sufficiency or of remedial measures. He also failed to issue an order not to cover the weeping tile or 'O' pipe so that he could inspect its installation on his next inspection. I appreciate Mr. Dehlen's opinion and experience but I do not think that in the end his evidence is seriously at variance with this finding. For he admitted on cross-examination that his opinion on the hypothetical question of what a reasonable inspector would do would be different in the milieu in which he actually worked, the City of Toronto. He in effect attempted to supply a different level of care for inspectors who work in less developed areas though they all operate under a provincial enforcement system. I have taken into account the circumstances in Lake of Bays in making my findings. While one can appreciate the difficulties of an inspector working alone in this part of Muskoka, I do not find any ground for applying a different standard of care.

[para57] Finally, I accept Mr. Morin's submissions that in the circumstances present in this case, the occupancy permit issued by Mr. Huggett on October 2, 1992 amounted to a representation that all Code requirements were met save and except those listed. It is true that the plaintiffs could see that some other items were unfinished. However, in listing some but not all Code defects, combined with his failure to indicate to anyone that he had not even done a final inspection despite the contents of the Township's own notice

(Exhibit 37), the permit negligently and mistakenly misrepresented its true more limited effect. The last inspection noted is "6. Final inspection for occupancy permit 48 hours" and the notice contains a statement indicating "full compliance with all the provisions of the Building Code Act". Mr. Huggett said he did not list more deficiencies simply because he ran out of space on the form. It was relied on by the plaintiffs to their detriment, and I find that their reliance on it was reasonable in the circumstances. The mere fact that the box 'partially completed' was ticked indicates nothing more to the reader than that the items listed were not complete and should be. Nowhere does the permit make clear that the inspector never checked and therefore could not verify the subsoil condition or weeping tile or the lack of insulation in a basement which had been added to the inspector's knowledge without any provision for it in the filed plans. Lack of basement insulation would have been visible on an inspection by the plaintiffs but not the significance of it, i.e. that it was a deficiency under the Building Code and the Township's by-law.

[para58] As to apportionment of liability in this case, the ignorance of building standards by the Mr. and Mrs. Larosee and their failures are complemented equally by the inadequacy exhibited by the Township's inspections and the ambiguous or simply untrue and certainly misleading occupancy permit. I would assess the liability of the defendants Mr. and Mrs. Larosee at 50% and of the Township at 50% in respect of the footings and basement insulation. Damages attributable to the failure of the water supply are the responsibility solely of Mr. and Mrs. Larosee.

Damages

[para59] The cost of drilling the new well is $4,472.60. It is clear that the dug well was improperly installed and could not be saved merely by a filter system. I see nothing unreasonable in the plaintiffs' action to replace what they were told was an adequate water supply by a drilled well. In addition, the plaintiffs seek $7,731.27 for various allegedly related expenditures. These consist of some 29 entries. I have reviewed the evidence on these claims. The following are allowed as damages for attempting to salvage the original well, alternate supply and regarding retainer of driller, drilling and connection to the new well:

Telephone Calls	$ 34.41
Bottled Water	$ 249.50
Preparation re well rear yard	$ 200.00
Preparation for water line - time	$ 418.00
Backhoe rental to dig trench for water line	$ 350.00
Fill for well	$ 375.00
Gravel re well rig to rear yard	$ 240.00
Top soil re trench and replacement well	$ 300.00
Pipe couplets for original well	$ 162.07
Sand point	$ 64.99
Hammer rental	$ 20.70
Plastic pipe to encase water line	$ 15.00
Cold water tank and pump	$ 2,772.71
Drilling well	$ 4,472.60
Clothing damage	$ 60.00
TOTAL	$ 9,734.98

[para60] I do not allow the remainder of the claims because they are unproven by receipts or other satisfactory evidence.

[para61] Mr. Mathon estimated the remedial work required to correct the subsidence and lack of weeping tile issues at $16,300.00

plus engineering design and certification	$ 2,500.00
TOTAL	$ 18,800.00

While the lack of base figures supplied to Mr. Mathon by a building contractor is troubling, there is no evidence to impugn the overall estimate which Mr. Mathon stands by. Given the difficulty of the work, I have no doubt the figures above are conservative. Mr. O'Hagan's criticism of the need for engineering services is noted but I accept Mr. Mathon's evidence of the need for them. He classed the work of Mr. Chapeskie to date as emergency-type, not lessening his estimate.

[para62] The expenses claimed by the plaintiffs for inspection and meeting with Mr. Wilcox are properly dealt with as part of the plaintiffs' costs. As to excavation and weeping tile work claimed by Mr. Chapeskie, I am not satisfied that it should be allowed in addition to the Mathon estimate. To do otherwise would in effect charge the defendants twice for the same work. Mr. Mathon stated that none of this work altered what he said was required and that includes weeping tile installation and all work required to repair the footings and foundation. Mr. Chapeskie plunged ahead with much of his labour without expert advice. I will leave it to the plaintiffs and their contractor to deal with any work not required due to Mr. Chapeskie's work and the portion due him, if any, for it.

[para63] As I stated earlier, I have found no evidence on which to place liability for fill and grading over the septic tank on the defendants.

[para64] The plaintiffs also claim general damages for hardship due to their lack of an adequate water supply from October 1992 until August or September 1993 when the new well was drilled and connected. I do not doubt that this was an inconvenience and a nuisance for them. The delay was caused because the plaintiffs lacked funds with which to pay. The only authority given to me to support an assessment on this account was Petruzzi v. Coveny, supra, which included a claim, not for lack of a potable water supply, but for mental distress caused by "distress and trauma" on account of many defects to a home. Damages for emotional upheaval were assessed at $4,000.00 in that case.

[para65] No similar remedy was granted in the various other cases cited to me. In this case, there was no medical or psychological evidence filed regarding any particular physical or mental problem caused to the plaintiffs. There is no doubt that this has been a most difficult experience for the plaintiffs. They are young and are now separated. No doubt the pressures and inconvenience caused by this situation contributed but, as in any human relationship, it is difficult to say that other factors of which I am unaware may not have caused a similar result in any event. Any happening of this nature is stressful as is the ensuing litigation. Without some evidence beyond the inconvenience suffered by the plaintiffs, which endured for a long time due to their own financial situation, and which I do not doubt was difficult, this claim for general damages is not assessable.

[para66] In summary, the plaintiffs shall have judgment as follows:

i) against Mr. and Mrs. Larosse alone	$ 9,734.98
ii) against the defendants Larosee (50%) and the Township (50%)	$ 18,800.00
TOTAL	$ 28,534.98

[para67] The defendants' cross-claims for contribution are dismissed.

[para68] Counsel may send written submissions on pre-judgment interest and costs, to me within 30 days, the plaintiffs' request to be within 2 weeks.
HOWDEN J.

Eramosa (Township) Chief Building Official v. Hilts

Between
David Sherratt, Chief Building Official for the Township of Eramosa, plaintiff, and
Louie Victor Hilts, defendant

[1997] O.J. No. 3693
DRS 98-04297
File No. 630/94

Ontario Court of Justice (General Division)
Guelph, Ontario
Langdon J.
September 8, 1997.

Counsel:
Elizabeth A. Waywell, for the plaintiff.
Hayes Murphy, for the defendant.

[para1] LANGDON J.:-- The Township applies for an injunction requiring Mr. Hilts to tear down a garage which he erected on his lot in the downtown area of the Village of Rockwood. For ease of reference I shall refer to the applicant as "The Township."

[para2] The buildings which were on the lot when Mr. Hilts acquired it before the 1987 fire had been used for commercial purposes for at least 60 years. In 1987 they were destroyed by fire. He rebuilt the buildings in two stages, the first more or less on the footprint of the former building, the second substantially different from the original.

[para3] In 1989, without securing the required building permit, he rebuilt a portion of the original structure which he used for light car repairs. The Township discovered that he had done so only some time after the building was complete and decided not to pursue the mater of the absence of a the permit. Mr. Hilts was made aware of the displeasure of the Township. The by laws in effect at the time would have permitted reconstruction of replacement buildings in the footprint of the old if the permit for reconstruction had been secured within one year of the fire.

[para4] In 1993, again without securing the required permit, he rebuilt the portion of the building he now uses for storage of cars and warehousing. The Township discovered that Mr. Hilts was building the 1993 portion before he had completed it.

[para5] He was served with orders to comply with the Building Code Act and twice with a stop work order. Despite the posting of these orders on site, Mr. Hilts completed construction. He reasoned that as the building was three quarters complete when the stop work order was served, he may as well finish it off.

[para6] Following a plea of not guilty and a trial, Mr. Hilts was convicted in Provincial Offences Court of building without a permit and disobeying a stop work order. Substantial fines were imposed on him. He did not appeal his convictions. Mr. Hilts still did nothing to secure a permit. In May 1994, the Township wrote him advising that he needed to apply for an amendment of the zoning by-law and a building permit in order to regularize the buildings. He ignored the letter. In September 1994, the Township commenced these proceedings. They were almost immediately adjourned to permit Mr. Hilts to apply for the requisite amendment and permit. In November 1994 Mr. Hilts filed his applications through one Logan, the planner he retained. The rezoning application requested that a full range of commercial uses be permitted although the property was an almost landlocked lot located behind other commercial buildings fronting on the street. Access to Mr. Hilts property was furnished only along a shared and narrow right-of-way. Logan and the Township's planner and engineer became involved in a dispute whether the survey which Mr. Hilts filed with his material was sufficient or whether, as Township personnel maintained, a much more detailed and expensive site plan was required. Mr. Logan declined to furnish the additional material which Township personnel demanded. A stalemate developed over that issue.

[para7] On June 6th 1995, the Township wrote Mr. Hilts and told him to complete his application in time for a council meeting to be held on June 19th. The Township specifically requested the disputed site plan, proof of Hilt's right of access along the right-of-way, information as to how municipal services might be supplied to the site, a list of what uses Hilts claimed to be legal non-conforming uses, and topographical and grading surveys. Logan refused to provide the additional material claiming that the information already supplied by Mr. Hilts to that date was sufficient for the Township to make its decision.

[para8] At its meeting, Township Council decided the application was premature and dismissed it. Hilts appealed the dismissal to the Ontario Municipal Board which held a full hearing in January 1996. At the time of the O.M.B. hearing, Hilts had proved his entitlement to access over the right-of-way but had not met any of the other disputed requirements. A further complication arose en route to the O.M.B. hearing. Because the right-of-way gave access to Provincial Highway 7 and the zoning involved a change of use, the Ministry of Transportation had to be consulted about the application. In the autumn of 1995 it stated its requirement for a traffic study. Mr. Hilts did not provide one.

[para9] Most of the facts involved in this application were fully litigated before the O.M.B. Although no argument was addressed to this issue before me, beyond suggestions in paragraphs 29 and 58 of the applicant's factum, it seems appropriate that the doctrine of issue estoppel should apply. I consider that where the Board decided factual matters, I ought to adopt those facts.

[para10] The existing zoning by-law divided Mr. Hilts site' into "hazard" and "residential" uses. The Township's new Official Plan, passed since the zoning by-law, converts the "hazard" designation to a "Natural Environment" designation, the two designations being reasonably consistent in substance. The New Official Plan converts the "residential" designation to "Commercial Core", a designation which would seem to be far better aligned with the actual characteristics of the property. The disputed buildings are situated on the residential/commercial core portion of the property. Before the O.M.B. Mr. Hilts made no claim for a legal non-conforming use. He agreed with the Township that he required a zoning by-law amendment in order to secure a valid building permit and that the new Official Plan should govern in considering the amendment to the zoning by-law; Mr. Hilts application to amend had been framed in that manner.

[para11] The Board noted that the reason given to amend the zoning was to legalize the existing use of the property but that the application sought an amendment which would not only permit the storage and light repair of cars - the present use - but would also permit the "full range of Zone 3 Commercial uses."

[para12] The Board dismissed Mr. Hilt's appeal from the Township's dismissal of his application to amend on 3 bases:

1. The uses proposed for the site by Mr. Hilts required the provision of full municipal services. The site enjoyed only well water. It had no septic system. The application did not adequately address the issue of the provision of services.

2. No information had been supplied by Mr. Hilts to satisfy the concerns of M.T.C. about vehicular access to Highway 7.

3. Mr. Hilts had not addressed valid concerns about either a site plan or storm water management. On the issue of the site plan, the Board decided that while a site plan is not usually required at the stage of applying for a zoning amendment, it would be required for issuance of a building permit. Because this building had already been erected without a permit, to grant the amendment without the site plan would be to "reward scoff laws by relieving them of ... analyses and site improvements that are required of the applicant who proceeds in a lawful manner."

The logic of this proposition is beyond dispute.

[para13] Mr. Hilts legal position on these facts is not a strong one to say the least. However, the issuance of an injunction is an equitable and discretionary matter. During the hearing certain issues arose which bore on the exercise of that discretion.

1. A former Township reeve, no longer in office at the relevant times, had written to council opposing Mr. Hilts' application. Unsolicited by either party he came forward to testify before the O.M.B.

2. The Township appeared to be placing obstacles, in the form of requests for additional information, in Mr. Hilts' path as his application proceeded.

3. Was the Township changing its position as to the provision of services as the matter progressed?

4. Was there possible discriminatory treatment of Mr. Hilts in the fact that a draft zoning by-law proposed by council after the new Official Plan designated a portion of the property in question as agricultural when the Official Plan designated it as commercial core?

5. Just before the O.M.B. hearing, counsel for Hilts arranged a settlement meeting with Township counsel. Just before it occurred the Township instructed its counsel not to participate in such a meeting.

[para14] Taken as a whole, these concerns if decided against the Township might well have supported a finding that the Township's actions here were being taken out of an oblique motive or in personam. It must be remembered that the area in question is rural and the village of Rockwood small.

[para15] I have concluded that there is no substance to the notion that the Township has acted out of improper motives.

1. The residence of the former reeve who displayed such an interest in the proceedings is situated within the area whose owners and occupants are entitled to notice of the zoning application. There is no direct evidence that the Township in any way encouraged or promoted his interest in the application. Thus the former reeve was within the class of persons whose interest in the application was recognized as legitimate. It appears to have been merely a coincidence that he was the former holder of political office in the applicant corporation.

2. The issue of additional obstacles was dealt with by the O.M.B. as noted above. There was a perfectly good reason for the Township to insist on a site plan and other related information that would not normally be required for a rezoning application, viz., that the building sought to be regularized had been already constructed without a permit.

3. The Township always recognized that there was no physical barrier to provision of municipal services. However, the Township did become concerned as to the location of those services. Considering that the right-of-way which alone provided access to a property for which the full range of commercial uses was being sought was but 20 feet wide, not to mention the potential legal difficulties of adding to the burden on an easement already in existence for many years, I must conclude that the Township's concerns were appropriate.

4. I have been persuaded that the draft by-law, (which was dropped like a bomb completely by surprise by Mr. Murphy on Ms. Waywell), which is still subject to public meetings and passage, properly places the property into a "holding" category. Counsel has pointed out that properties other than Mr. Hilts' are treated in the same way as his. These properties all share common characteristics in that they back on to a steep slope which is part of a Natural Environment zone and have highway access

only by right-of way. Moreover, Mr. Hilts and his planner were both aware of the proposed by-law and have chosen so far not to attend any meeting or submit any document of opposition to it.

5. As the O.M.B. hearing drew near, Mr. Hilts and the Township had been around the merry-go-round several times concerning their impasse over whether Mr. Hilts ought or ought not to provide site plan data to the Township as part of his rezoning application. Neither party had budged. In this context it is not surprising that the Township may have come to the conclusion that further negotiations in the absence of that material would be fruitless and thus a needless expense. Historically Mr. Hilts, despite having acted in an obviously illegal manner, to put it charitably, had never shown the least willingness to accede to Township requests except when under the gun because of litigation. In this context, I can not find anything improper in the Township's decision to proceed to the hearing without a last minute settlement meeting. Settlement negotiations did occur as the hearing proceeded.

[para16] Mr. Hilts' arguments against the injunction, not already disposed of are as follows.

[para17] Part of the agreement to adjourn the injunction proceedings at their inception was that the Township would cooperate with Mr. Hilts in the application which he agreed to prosecute for a rezoning and building permit. He says they have not done so. To cooperate does not mean to capitulate. On a broad overview of the circumstances it occurs to me that Mr Hilts' complaint of non-cooperation resembles the pot calling the kettle black.

[para18] The Township gave very short notice of its final meeting to consider Mr. Hilts' application. The council had waited over two years for movement on Mr. Hilts' part on the site plan issue. It was not forthcoming. The O.M.B. appeal was based in part on the shortness of this notice and was unsuccessful.

[para19] The Township ignored the recommendation of its own planner to recognize existing uses as least. However, Mr. Hilts application was not restricted to existing uses. Council was required to deal with an application to permit the full range of core commercial uses. As well, the O.M.B. did not give effect to this ground of appeal. That issue is another not to be relitigated.

[para20] The present use of the property complies with the new Official Plan even though the existing zoning by-law and the proposed by-law do not. A building which complies with the Official Plan ought not to be torn down. If this line of reasoning were correct then it would effectively emasculate s. 8 of the Building Code Act which prohibits construction of a building "unless a permit has been issued therefor by the chief building official." The would-be builder would only have to be certain that existing zoning by-laws permitted the use for which he intended his building and he could proceed. Such an interpretation would lead to chaos.

[para21] Even if I accept that Mr. Hilts reconstructed the first portion of the present garage in good faith and in ignorance of the requirement for a permit, a proposition which I would be most reluctant to accept, it is clear that he became aware of the requirement for a permit and that he ought to have got one. He was fortunate that the Township chose to let that sleeping dog lie. However, his decision, in the light of that history, to proceed with the extension without troubling himself to get a permit, and well outside the time frame of the by law which permitted reconstruction "in the footprint" can only be described as defiant. His later decision to finish the construction after a stop work order had twice been posted on site was downright contumacious. There is little, if anything, in what later occurred which suggests any change of attitude. He completed construction of the building after service of the stop work orders on May 18th and 20th 1993. One year later the Township wrote and advised him of what he needed to do to regularize the situation. In July 1994 he was convicted of the offences and fined $1,500.00. Still he did nothing. He was prompted to act only when this application was served. Only then did he begin the

process which had been outlined to him six months earlier in the letter of May 1994. Fully two years later the Township was forced to bring this matter to a head by fixing a date for the hearing of the rezoning application, the first stage of the process of regularizing the building.

[para22] After a careful examination of the facts I have found no proof of any sort of bad faith on the part of the Township. Certainly Mr. Hilts has not discharged the onus of proof, which lies on him, (Re Hewitson and Hughes, 31 O.R. (2d) 536 at 541), to demonstrate why this application should be dismissed. The court is always reluctant to make a mandatory order of so destructive a character. However, I see no alternative but to follow the words of Holland J. In Re Hewitson and Hughes, (supra):

> "These buildings are to be demolished because the failure to obtain a permit was deliberate and defiant and ... without any honest belief that such were not required." I add that their completion was proceeded with in the face of two stop work orders properly served. "To permit these buildings to remain standing in these circumstances would be to reward [Mr. Hilts'] offensive conduct."

[para23] Indeed, to permit this building to remain would encourage disobedience of and promote disrespect for the law. An order will issue for the demolition of that portion of the garage which was constructed in 1993.

[para24] Unless there are considerations of which I am unaware, in which case I may be spoken to, the applicant will have its costs of these proceedings throughout.

LANGDON J.

Forster v. Waterloo (City)

Between
John Forster, Appellant, and
The Corporation of the City of Waterloo and Gunther Trinkaus,
Respondents

[1993] O.J. No. 415
DRS 93-06223
Action No. 3415/92

Ontario Court of Justice - General Division
Kitchener, Ontario
Sills J.
February 12, 1993

John S. Doherty, for the Appellant.
Kimberly L. Evans, for the Respondents.

SILLS J.:-- This matter is an appeal from a decision of the Chief Building Official of the City of Waterloo by way of an application pursuant to Section 15 of the Building Code Act, R.S.O 1990, Chapter B-13. Section 15(3) of the said Act provides,

> "Where an application is made to a judge for a hearing under Subsection (1), the judge shall appoint a time for and hold the hearing and may rescind or affirm the order or decision of the Inspector or Chief Official or take such action as the judge considers the Inspector or Chief Official ought to take in accordance with this Act and the

Regulations, and for such purposes the judge may substitute his or her opinion for that of the Inspector or Section 6(1) of the said Building Code Act provides,

"The Chief Official shall issue a permit except where,

(a) the proposed building or the proposed construction or

demolition will not comply with this act or the building code or will contravene any other applicable law;"

The basic chronology of events leading up to this hearing are not in dispute, as follows:

May 11, 1992: Applicant submits proposed site plan to the Planning and Development Department of the Respondent corporation pursuant to Section 41 of the Planning Act;

May and June, 1992: Last extensive review of site plan by staff of the Planning and Development Department and submission of the site plan to the Site Plan Review Committee on May 25, 1992 and June 22, 1992;

July 15, 1992: Waterloo City Council received a report, PD92-40, prepared by Scott Amos of the Planning and Development Department recommending approval of the site,

landscape, and elevation plans and City Council deferred acceptance of the Report to its next regularly scheduled meeting on August 17, 1992. At the meeting on July 15, 1992, members of council requested legal advice as to whether they could defer consideration of the said Report and site plan until completion of a Neighbourhood Density Task Force Report;

July 27, 1992: Building plans were submitted by the applicant to the building department of the City of Waterloo seeking a building permit;

July 29, 1992: Council decided not to defer consideration of Report PD92-40 and consideration of the applicant's site plan until the completion of the Neighbourhood Density Task Force Report;

August 17, 1992: City Council considered reports PD92-40 and PD92-49 which latter report responded to previous inquiries from

members of council, both reports recommending approval of the site plan and confirming the full compliance with applicable zoning and site plan requirements. Council unanimously passed a Resolution refusing to approve the site plan and directing City staff not to issue a building permit. Subsequently, the Chief Building Official refused to issue the requested building permit citing the direction of council.

September 4, 1992: Notice of Application issued seeking "an Order directing the respondents to issue a building permit...". This application was made returnable on October 22, 1992.

October 21, 1993: Letter from counsel for respondents to counsel for applicant (applicant's supplementary record, Tab 5) advising, further to a recent telephone

attendance between the parties, "that a building permit with respect to the above-captioned property will be available once your client can satisfy

the three outstanding issues:

(a) The interior structure must confirm (sic) (conform) to the definition of apartment building. In this connection, Mr. Trinkaus has met with your client's draftsmen and expects this issue to be resolved this week.

(b) Engineering approval of storm water management, site servicing and outstanding connection changes. We understand that this within the control of your client and should be able to be satisfied this week.

(c) Site plan approval. In this connection, we understand that there have been discussions with Rob Deyman regarding the provision of additional parking facilities. It is our understanding that your client is amenable to addressing Mr. Deyman's concerns.

Once these issues have been addressed then Mr. Trinkaus will be in a position to issue the building permit requested.

We would be pleased to discuss the foregoing with you at your earliest convenience. Further, it would also be appropriate to discuss the disposition of your upcoming motion as soon as possible."

October 27, 1992: Revised building plans for building permit purposes submitted complete and in compliance with requirements of the Building Department;

November 16, 1992: Revised storm water management report approved by City Engineering Department;

November 18, 1992: Informal public meeting of City Council (pursuant to Notice dated November 5, 1992) with respect to re-zoning of applicant's land deleting "apartment swellings as a permitted used" in the zoning by-law. On November 16, 1992, City of Waterloo Planning Department released a report, PD92-74, regarding down-zoning of the applicant's property (among others) following upon the recommendations of the Neighbourhood Density Task Force which had reported to Council in Report PD92-59, dated October 2, 1992;

November 20, 1992: Request by Waterloo Planning and Development Department that applicant execute Site Plan Agreement which was done on that date. The Agreement was never executed by the City of Waterloo.

November 23, 1992: Letter from counsel for applicant to Ontario Municipal Board and City of Waterloo referring to the Ontario Municipal Board the refusal of Waterloo City Council to approve the site plan by its Resolution of August 17, 1992. This letter was received by

the City of Kitchener on November 24, 1992. Same date counsel for the respondent City had advised by letter of that date to counsel for the applicant of "the imminence of the issuance of a building permit";

November 24, 1992: Letter from counsel for respondents to counsel for the applicant (supplementary application record, Tab 22) noted that issuance of building permit is imminent. A sentence in the letter stated, "Perhaps it would be appropriate to discuss the disposition of your client's motion, now scheduled for December 21, 1992 in order that it may be resolved without argument".

November 30, 1992: Rob Deyman, Commissioner of Planning and Development for the City of Waterloo meets with neighbours with respect to the applicant's proposal;

December 7, 1992: Resolution of Waterloo City Council instructing its solicitors to oppose the application by the applicant for a building permit;

December 16, 1992: Formal public meeting of Waterloo City Council with respect to enactment of by-law down-zoning the applicants property to delete the uses required for the project which was the subject matter of the building permit application. The enactment of this by-law has been appealed by the applicant to the Ontario Municipal Board. Further, there is outstanding an application by the applicant for judicial review to quash the enactment of the down-zoning by-law.

The issue to be determined is whether the proposed building project, the subject matter of the building permit application, contravenes the Building Code Act, the Building Code or any other applicable law.

It is clear from the evidence in this case that the subject matter of the application for a building permit complies with the Building Code Act and the Building Code.

The position of the applicant is that Site Plan approval by Waterloo City Council is not an absolute pre-condition for issuance of a building permit and that the enactment of the down-zoning by-law subsequent to the building permit application is not a bar to the issuance of the permit sought. Further, the applicant contends that there was a settlement of this litigation, evidenced by letter dated October 21, 1992 from the solicitor for the respondent to the solicitor for the applicant which settlement was allegedly accepted through telephone communications between the solicitors on October 23, 1992 and October 27, 1992.

The position of the respondent is that Section 41(2) of the Planning Act and City of Waterloo By-Law 91-58 (Site Plan Control Area By-Law) constitute "other applicable law" which has not been complied with and that the absence of site plan approval constitutes an exception to the mandatory requirements of Section 6 of the Building Code Act justifying refusal to issue a building permit. Further, the respondent takes the position that there was no settlement of this application as alleged by the applicant.

Insofar as the legal principles to be applied are concerned, the applicant relies essentially on:

Re: Revenue Properties Co. Ltd. and the Corporation of the City of Toronto (1984), 26. M.P.L.R. 165, and,

Dominion Stores Ltd. v Borough of Etobicoke, (1982), 37 O.R. (2d) 661.

In Revenue Properties, the Municipality refused to consider applicant's application for site plan approval, refused to even examine the application for building permit and after the applicant applied for the building permit, council enacted a zoning by-law amendment that would prohibit the proposed construction by the applicant. The Municipality took the position that the applicant was not entitled to a building permit until site plan approval had been given. Matlow, J., at page 169, concluded that site plan approval by the municipal council is not an absolute pre-condition for the issuance of a building permit. He also concluded that issuance of a building permit prior to the granting of site plan approval would not result in any contravention of the Building Code Act and, in particular, in the circumstances of that case, that the proposed construction would not contravene any other applicable law merely because site plan approval has not been given. He

found that actual construction, If it were to proceed prior to site plan approval would be in violation of the Planning Act.

In Dominion Stores, the proposed use was, in all respects, in compliance with municipal zoning by-laws and the applicant had complied with all the requirements for issuance of a building permit and was prima facie entitled to it. The Municipality refused to issue the permit because it had not given developmental control approval under Section 40 of the Planning Act. The applicant applied, in that case, to the Division Court for judicial review. Galligan, J., at page 662, said:

> "The issue before this court is whether the Municipality is legally entitled to refuse to give developmental approval that ground. While a certain amount of discussion took place before us as to whether developmental approval
>
> under Section 40 of the Planning Act is or is not a condition precedent to the issue of a building permit, I do not think it is necessary for the purpose of this application to decide that issue. I am of the opinion, assuming without deciding that developmental approval is a condition precedent to the issuance of the building permit, that a municipality may not withhold such approval for a reason that is not authorized by law. If it were otherwise, an applicant's legal right to a building permit could easily be frustrated."

Then at page 665, Galligan said:

> "I do not think that a municipality is entitled to refuse developmental approval for an unlawful reason and thereby effectively frustrate a landowner's prima facie right to issue of the building permit. The Municipality withheld this building permit for a reason that is not authorized by law. It follows, therefore, that it must now issue it. In my opinion, therefore, the applicant is entitled to its building permit and the Municipality is ordered to issue it."

In dealing with the question of the exclusive jurisdiction of the Ontario Municipal Board to deal with matters of site plan approval, Galligan said, again at page 665,

> "If this case involved a legitimate dispute about details or terms (of site plan approval) there would be great force in that argument (that there is an alternative remedy and that therefore this court should refuse to exercise its discretion in favour of the applicant). But in this case I think that there is no legitimate dispute. There is what seems to me to be nothing more nor less than unlawful obstinacy. Therefore, I do not think that the applicant is required to go to the Ontario Municipal Board before coming to this court."

The respondent, with respect to the legal principles involved, relies essentially on:

(a) Quay West v Toronto, (1989), 47 M.P.L.R., 103, and,

(b) 861168 Ontario Inc. v Foreshew, (1991), 3 O.R. (3d) 721 and,

(c) 715113 Ontario Inc. v Ottawa, (1978) 63 O.R. (2d) 102

In Quay West, the applicant applied for a building permit and subsequently the Municipality passed an Interim Control By-Law under which a proposed condominium development was not a permitted use. The applicant sought mandamus compelling the issuance of a building permit and his application was dismissed. The Divisional Court in this case found that Section 34(9) of the Planning Act does not exempt the erection of the buildings for which a permit ought to have been issued before the effective date of the zoning by-law, but only buildings for which a permit has in fact been issued. The court further found that the Municipality was not under a duty to issue the permit when the application was originally made because at that time there had been no site plan approval. Further, the Divisional Court found that this was not a case where a permit should be issued despite the lack of such approval as the respondent Municipality acted in good faith and for a proper purpose in enacting the interim control by-law. At page 110, the Divisional Court found that the Municipal

Council had not acted in bad faith or for an improper purpose in enacting the Interim Control By-Law or that it was discriminatory or unreasonable such that the by-law ought to be

quashed. The court stated that the effective period for an Interim Control By-Law could not be extended beyond two years from the date of its original enactment. At page 111, Southey, J. said,

> "As a general rule, a building permit should not be issued for a development in a site plan control area to which Section 40 of the Planning Act applies until site plan approval for the development has been obtained from council or the Municipal Board.

At page 112, Southey, J. goes to deal with the Dominion Stores case the Revenue Properties case, as follows:

> "There are two decisions in which it was held that a building permit should have been issued, despite the lack of site plan approval (Re: Dominion Stores Ltd. and Re: Revenue Properties Co.). Both arose from extraordinary circumstances in which the Municipality was not acting in good faith or was refusing developmental approval for an obviously unlawfully reason. Having refused to quash the Interim Control By-Law in this case as one improperly enacted, I am not prepared to hold that this is one of
>
> those extraordinary cases in which the building permit should have been issued despite the absence of site plan approval."

Also in the Quay West case, Saunders, J., concurring in the result, said at page 112,

> "In my opinion such an order (mandamus) ought not to issue because of the existence of the Interim Control ByLaw and the provisions of Section 34(9)(b) of the Planning Act. I do not consider it necessary to decide whether the chief official was under a duty in August, 1988 to issue the permit despite the absence of a site plan agreement. It may be that such duty did exist on the basis of the reasoning in the Dominion Stores case."

861168 Ontario Inc. v Foreshew, was a decision of Taliano, J. of this court. The decision in that case was based on the finding that Section 40 of the Planning Act had no application in the particular circumstances of that case and that no site plan agreement or approval was required for that particular project. Accordingly, I find that decision to be of little assistance in this case.

715113 Ontario Inc. v Ottawa was a case which was referred to in Quay West (supra). This case too involved enactment of an interim control by-law which froze the use of the land in the area for a year while a review of land use policies for the area was undertaken. Henry, J. found that the interim control by-law was adopted for a valid public purpose, was non-discriminatory and that council acted in the public interest within the statutory authority for enacting interim control by-laws.

With respect to the issue of whether or not a settlement of this application had been reached between the respective solicitors, I find that the correspondence of October 21, 1992 and subsequent telephone discussions of October 26 and 27, 1992, did not constitute a settlement agreement. There is no written confirmation of what transpired in the oral discussions of October 26 and 27 and the letter of October 21, far from constituting an agreement, simply recited a series of outstanding issues of that time.

The important question in this case is whether site plan approval is a pre-condition to issuance of a building permit.

Southey, J., speaking for the Divisional Court in the Quay West case, expressed the view that "as a general rule" a building permit should not be issued until site plan approval has been obtained from council or the Municipal Board. However, in distinguishing the Quay West case from the Dominion Stores and Revenue Properties situations, he acknowledges that in extraordinary circumstances, where a municipality is not

acting in good faith or was refusing developmental approval for an obviously unlawful reason, it may be appropriate that a building permit should be issued despite the absence of site plan approval.

Accordingly, I find that site plan approval does not constitute an absolute pre-condition for the issuance of a building permit.

In Quay West and in 715113 Ontario Inc. (both supra), it was clearly established that the procedure followed by the municipalities in enacting interim control by-laws, was a non-discriminatory, valid exercise of a statutory authority in which there was neither bad faith or an improper purpose. From the material before me, it is obvious that the applicant herein

went to extraordinary lengths through his consultants to satisfy all of the requirements of the City of Waterloo and had every reason to expect that a building permit would issue. The matter of site plan approval had proceeded to a point where the applicant had signed a site plan agreement and returned it to the City for execution when council formerly approved the site plan and authorized execution of the agreement on the part of the City of Waterloo. The applicant had every reason to expect that that agreement would be executed. It is also obvious that the city council had authorized a neighbourhood density review and was awaiting receipt of the Neighbourhood Density Task Force report. In my view, the action of City Council in enacting a down-zoning by-law hard on the heels of the receipt of that report, having delayed its consideration of the applicant's site plan while at the same time instructing engineering and planning staff to continue negotiations with the applicant with respect to engineering and planning issues, constitutes bad faith and brings this applicant's situation into the category of extraordinary circumstances as referred to by Southey, J. in the Quay West case in his reference to the Dominion Stores and Revenue Properties cases.

Although the matter of site plan approval remains

outstanding and subject to the process provided for in the Planning Act and the site plan control area by-law of the City of Waterloo, that matter can and must be resolved before construction begins.

In the result, an order will go directing the issue of the building permit.

Costs of the application may be spoken to, arrangements to be made through the Trial Co-Ordinator at Kitchener.

Re Friends of McNichol Park and Corporation of the City of Burlington et al.

31 O.R. (3d) 405
[1996] O.J. No. 4143
Court File No. 512/96

Ontario Court (General Division), Divisional Court,
Steele, McRae and Corbett JJ.
November 27, 1996

APPEAL under s. 26 of the Building Code Act, 1992, S.O. 1992, c. 23, from a judgment of Carnwath J. (1996), 33 M.P.L.R. (2d) 198 (Ont. Gen. Div.).

Rodney V. Northey and Richard J. King, for appellant.
Christopher J. Tzekas and Mike G. Kovacevic, for respondents, Corporation of the City of Burlington and Daniel B. Mousseau, Chief Building Official for the City of Burlington.
Kirk R. McPherson, for respondent, Joseph Brant Memorial Hospital.

The judgment of the court was delivered by

STEELE J.: -- This is an appeal under s. 26 of the Building Code Act, 1992, S.O. 1992, c. 23 (the "Act"), from the decision of Carnwath J. [(1996), 33 M.P.L.R. (2d) 198] made on an appeal under s. 25 of the Act from the decision of the Chief Building Official of the Corporation of the City of Burlington (the "City") to issue a building permit to Joseph Brant Memorial Hospital (the "Hospital") for the construction of a rehabilitation day clinic referred to as the Wellness House on lands owned by the City in an area referred to as McNichol Park (the "park").

The City purchased the park with the intention that a portion of the purchase price would be recovered from external sources on the sale of a portion of the lands to recover a minimum of 50 per cent of the acquisition costs. The easterly area of the park is designated as "Park" in the City's official plan. The westerly area is designated "low density Residential". The entire property is zoned "R1" residential. Notwithstanding submissions by the appellant I am satisfied that the building permit in issue applies only to a proposed structure in a portion of the westerly area of the park, which I will refer to as the site.

The City conducted a feasibility study as to how the park ought to be developed to meet the City's financial requirements while still providing a unique waterfront park. Notwithstanding recommendations against it by one of council's committee, in 1991 the City approved a strategic plan to retain most of the park as parklands and the promotion of partnerships between the City and private developers for the development and ongoing operations of the westerly area.

In 1992, 1993 and 1994 the City sought proposals for the development of the property and had extensive consultations with the public and public agencies. Council rejected the idea of retaining the whole of the park for parklands. In 1994 council approved a strategic waterfront plan calling for the maintenance and enhancement of the easterly area and partnership agreements for the development of the northwest quadrant in which the proposed Wellness House would be located and authorized Shoreacres Park (Burlington) Community Corporation ("SPCC") to submit a site plan application for the Wellness House. On April 3, 1995, SPCC submitted a formal application for the site plan approval as "applicant/agent". There was no reference as to SPCC actually intending to construct the Wellness House. The staff of the City reported to council that the park be used for a variety of uses in various areas including the Wellness House. It was acknowledged that some of the uses proposed for multiple residential use would require amendments to the City's official plan and zoning by-law.

A public meeting was held on June 21, 1995, to consider the site plan for Wellness House. It is the position of the City that this public meeting was not required by the Planning Act, R.S.O. 1990, c. P.13 (the "Planning Act"). On July 18, 1995, the City's Planning Department reported to a committee of council recommending that site plan approval be given subject to the condition that the Wellness House be operated and funded

by the Hospital and stated that the Hospital was a "Public Authority" within the meaning of the zoning by-law and its use was therefore not restricted. The report noted that 33 trees would have to be removed but that the City's "Tree By-law" required replacement tree planting to compensate for their removal. I should note that in an earlier report to council the Wellness House had been referred to as an institution.

Friends of McNichol Park ("FMP") was incorporated on August 4, 1995, and its objects relate exclusively to McNichol Park and include the beautification and preservation of the park as public parkland. Counsel advised the court that its membership consists of over 200 persons throughout the City of Burlington and that it is not composed of a group immediately adjacent to the park. Persons who subsequently became members of FMP on numerous occasions had objected to the development of any of the park including the construction of Wellness House. The overall objection was that it wished to preserve the lands for a park. It raised the issue of the need to rezone the northwest corner for multiple residential uses and its objection to them. It did not expressly raise the issue of the need of rezoning for the Wellness Centre until after the site plan was approved some months prior to the issuance of the building permit.

On August 14, 1995, the City's development committee and council considered the planning report. FMP appeared on three occasions including August 14, 1995, opposing the approval of the site plan application. Notwithstanding this council approved the application of the site plan for Wellness House. On August 17, 1995, counsel for FMP wrote to the City that it was FMP's position that the proposed use of the property for the purpose contemplated by the site Plan contravened the City's comprehensive by-law. On September 11, 1995, a formal site plan agreement was entered into between the City and the Hospital. In January 1996, the City and the Hospital entered into a 50-year lease for the site. On January 8, 1996, the hospital submitted an application for a building permit for site services and foundations for Wellness House. The Chief Building Official concluded that the application met all requirements of the Act, the Planning Act and the zoning and other by-laws of the city and the site plan and issued a building permit on February 8, 1996. On February 26, 1996, counsel for Friends of McNichol Park served a notice of appeal on the City and the hospital.

Carnwath J. heard and dismissed the appeal. After hearing argument on both the issue of standing and whether or not the building permit contravened applicable law, he concluded that FMP had no legal standing to bring the appeal. Having done so he did not find it necessary to consider the issue of the legality of the issuance of the building permit. He relied on the decision in Friends of Toronto Parkland v. Toronto (City) (1991), 6 O.R. (3d) 196, 8 M.P.L.R. (2d) 127 (Div. Ct.) (the "Parkland case"), and found that the facts were strikingly similar to the present facts. Quoting from the Parkland case he found this is "a battle which has been fought and lost" and he concluded that while FMP members considered themselves aggrieved, he did not believe that it was "reasonable" on their part to do so. He therefore exercised his discretion and found that FMP had no standing in this matter.

The relevant sections of the Act are as follows:

8(1) No person shall construct or demolish a building or cause a building to be constructed or demolished in a municipality unless a permit has been issued therefor by the chief building official.

(2) The chief building official shall issue a permit under subsection (1) unless,

(a) the proposed building, construction or demolition will contravene this Act or the building code or any other applicable law;

. . . . .

(3) Even though all requirements have not been met to obtain a permit under subsection (2), the chief building official may issue a conditional permit for any stage of construction if,

(a) compliance with by-laws passed under sections 34 and 38 of the Planning Act and with such other applicable law

as may be set out in the building code has been achieved in respect of the proposed building or construction;

. . . . .

25(1) Any person who considers themself aggrieved by an order or decision made by an inspector or chief building official under this Act or the regulations, except a decision not to issue a conditional permit under subsection 8(3), may, within twenty days after the order or decision is made, appeal the order or decision to a judge of the Ontario Court (General Division).

. . . . .

(4) If an appeal is made under this section, the judge shall hold a hearing and may rescind or affirm the order or decision of the inspector or chief building official or take such action as the judge considers the inspector or chief building official ought to take in accordance with this Act and the regulations and, for such purpose, may substitute his or her opinion for that of the inspector or chief building official.

. . . . .

26(1) A party to the hearing before the judge of the Ontario Court (General Division) under section 25 may appeal from the decision to the Divisional Court.

. . . . .

(3) An appeal under this section may be made on any question that is not a question of fact alone and the court may,

(a) confirm or alter the decision of the judge;

(b) direct the inspector or chief building official to do any act he or she is authorized to do under this Act;

(c) refer the matter back to the judge for reconsideration; or

(d) substitute its opinion for that of the inspector or chief building official or the judge.

With respect I disagree with the conclusion of Carnwath J. on the basis that he misunderstood the application of the Parklands case to the present and that he did not decide on the issue of whether or not the building permit was issued contrary to the Act. In my opinion the appeal from Carnwath J. is not on a question of fact alone. This court may therefore substitute its opinion for that of Carnwath J.

Under s. 8(1) of the Act no permit shall be issued where it will contravene "any other applicable law". It was conceded by counsel for the City that a prohibition of the use of land under the provisions of the zoning by-law is an applicable law. This is made abundantly clear by the provisions of s. 8(3) of the Act.

The zoning by-law of the City prohibits the use of land for all purposes except those permitted by the by-law. There are certain specific exceptions to this. The land in question is zoned R1 which does not expressly permit the use in question. One argument of counsel for the City was that the Wellness House was an institution. I can find no provision in the by-law permitting institutions in an R1 zone. They are permitted in at least one other defined zone.

The City relies on the provisions of the zoning by-law to say that the Wellness House is a "public authority".

The applicable provisions of the zoning by-law are as follows:

Public Authority

Means Federal, Provincial, or Municipal bodies and includes any commission, board, authority or department established by or for any of them.

. . . . .

2.19 USES NOT RESTRICTED

EXCEPT with respect to requirements for parking, and EXCEPT AS
otherwise specifically provided or limited, the provision of this By-law shall not apply to: --

Public Authority in any zone EXCEPT with respect to requirements for parking and EXCEPT AS otherwise specifically provided or limited, the provisions of this By-law shall not apply except in the case of an 03 zone to:

(1) Schools --

. . . . .

(2) Hospitals, Public

Subject to the following:

Lot Area -- 4 ha.

Set-back from any lot line -- 15.2 m

In addition, under s. 2.19 various specific uses such as places of worship, agricultural or farming use, nursing home or home for the aged, front yards and miscellaneous are specifically set out. Some regulations are applicable to each category.

In my opinion the Hospital is not a public authority within the terms of the zoning by-law. Public authority as defined does not specifically include a public hospital. It was argued that under s. 2.19 that use for a public hospital is not restricted in any zone. It is not desirable or necessary to decide this point on this poorly drafted by-law because the hospital concedes that even if such use is permitted that on the evidence it is clear that this site does not have sufficient lot area to comply with the exception.

It was argued that the hospital is a public authority because it is administered by a board and that it was established under provincial government authority and that most of its funding is provided by the provincial government. In other words, that it is a "board . . . established by or for" a provincial body.

In my opinion, this interpretation is fallacious. There is nothing in the provisions of the Public Hospitals Act, R.S.O. 1990, c. P.40 (the "Hospitals Act"), that incorporates a hospital. Section 4 of the Hospitals Act provides that no hospital may be incorporated under the Corporations Act, R.S.O. 1990, c. C.38, or under a private Act without the prior approval of the Minister of Health. Also, no institution, building or other premises may be operated or used for the purposes of a hospital unless it has received the approval of the Lieutenant Governor in Council.

The Hospitals Act defines a hospital as an institution. A hospital has a "board" that is the board of directors of a hospital. This does not make the hospital itself a board within the meaning of the zoning by-law. Even if it were a board within the meaning of the zoning by-law it is not one established by provincial body. A hospital is no more an establishment created by or for a provincial body any more than any private or public corporation incorporated under the Corporations Act or Business Corporations Act, R.S.O. 1990, c. B.16. The decisions in Schnurr v. Royal Ottawa Hospital (1986), 56 O.R. (2d) 589 at p. 593, 31 D.L.R. (4th) 429 (C.A.), and in Stoffman v. Vancouver General Hospital, [1990] 3 S.C.R. 483 at p. 513, 76 D.L.R. (4th) 700 at p. 739 are consistent with my view that a public hospital is not a public authority. For these reasons an amendment to the zoning by-law is required if the Wellness Centre is to be constructed on this site. Therefore the building permit was improperly issued in contravention of an applicable law.

The next question is whether the FMP has standing to launch the appeal from the issuance of the building permit.

Section 34 of the Planning Act sets out a procedure whereby a municipal council may pass zoning by-laws or amendments thereto. This procedure requires information to be made public

as to its intent and that notice and, at least one public meeting be held. After the by-law is passed the clerk must give notice thereof. Any person who has been given notice may appeal to the Ontario Municipal Board (the "OMB"). The OMB shall hold a public hearing and has the power to approve or repeal the by-law. There is no reference to a "person who considers themselves aggrieved" by the decision of council to pass the zoning by-law. The persons who may appeal to the OMB would include any member of FMP and in my opinion this includes FMP itself: see Energy Probe v. Canada (Attorney General) (1989), 68 O.R. (2d) 449, 3 C.E.L.R. (N.S.) 262 at p. 282. There is no provision in the Planning Act and/or the Act that an objector must be a ratepayer. Reference is made only to a "person". By virtue of s. 29 of the Interpretation Act, R.S.O. 1990, c. I.11, a person includes a corporation. In Loblaws Inc. v. Ancaster (Town) Chief Building Official (1992), 12 M.P.L.R. (2d) 94, 95 D.L.R. (4th) 695 (Ont. Gen. Div.), a corporation was allowed standing in a matter involving the Act. I do not read the Parklands case as refusing standing merely because the applicant was a corporation.

The real issue of standing is whether or not FMP is "a person who considers themselves reasonably aggrieved": see Parklands, supra, at p. 204. The test is set out in Parklands at p. 205 as follows:

> The words of s. 15 of the Building Code Act represent an express provision intended by the legislature to be dispositive of the question of standing under that statute. While the word "aggrieved" is not to be understood in some traditional sense relating to a person's legal interest, nevertheless, the legislature clearly intended that some threshold test be applied and it would be inappropriate to leave the whole matter either to the subjective whim of the appellant or solely to the discretion of the court. The word "aggrieved" is to be considered in its ordinary dictionary meaning and not as a legal term of art. It is used today only in the passive voice referring generally to distraught or agitated states of mind. Persons who consider themselves aggrieved are persons who consider themselves wronged by a decision of the Chief Official within the context of the Building Code Act. In our view, persons may be aggrieved within the meaning of that term in s. 15 though they have suffered no legal harm. It is the responsibility of the courts, when requested to do so, to determine if a particular administrative action is legitimately within the scope of the statutory power and an appeal is not to be barred simply because the appellant does not have a personal proprietary or pecuniary interest.

On the facts before us, it is clear that the appellants have a different approach to the appropriate use of parks and park lands. Their main objective was to prevent or obstruct the construction of the community centre project. This was a battle which they had fought and lost. Questioning the parking component of the building permit as constituting a violation of the by-law was a last effort to realize their goal. Considering the history of their involvement, it is doubtful that they considered themselves aggrieved by the underground facilities for parking permitted by the building permit. But even if they did, in our opinion, Hoilett J., exercising his discretion as he did, came to the proper decision. Every superior court has the inherent jurisdiction to protect the integrity of its own process.

It should be noted that in Parklands the matter before the OMB was the approval of a capital expenditure. The general objections to infractions of the zoning by-law were referred to before the OMB but it was not the issue before the OMB.

I agree with the analysis of Parklands with respect to standing set out by Feldman J. in Loblaws Inc., supra, at p. 99 as follows:

> The best source of analysis for the scope of standing under the section is the Friends case itself. In that case, the court allows for the broadest of nexus between the interests of the applicant and the decision to issue the building permit. In that case, the appellant public interest group had no proprietary or pecuniary interest in the decision, but rather felt that the development in question was not in the public interest for various reasons. The court would not have denied them standing on that basis, but because they had already tried to stop the development through several other

routes within the planning process, with no success, the court was of the view that the applicant was now trying to use an appeal regarding the alleged non-compliance of the parking component of the permit as another route to accomplish their original purpose, and questioned the bona fides of their subjective feelings of being aggrieved by the decision to issue the permit.

In the present case the Town has been aware that zoning has always been in issue. The town incorrectly believed that the Wellness House complied with its by-law. The appellants have always said that it did not. Reference is made in Parklands that no ratepayer had come forward to resolve the issue in court. This obviously was a reference to s. 327 of the then Municipal Act, R.S.O. 1980, c. 302. It was in a context of a 10-year process. In my opinion, this does not preclude a reasonably aggrieved person from immediately pursuing its rights under the Act where a by-law is contravened.

Counsel for the City argued that FMP should have brought an application under rule 14.05(3)(d) of the Rules of Civil Procedure to determine rights on the interpretation of the zoning by-law and therefore should not be allowed standing. In my opinion, it was equally open to the City itself to bring such an application after it was advised that any issuance of a building permit would be challenged. I do not believe that this should preclude FMP in the present case. It is clear that in Parklands the court felt that the questioning of the parking area was a last effort attempt to obtain success in a "battle which they had fought and lost".

In the present case Carnwath J. considered the issues and concluded that the case was strikingly similar to Parklands and exercised his discretion not to grant standing to FMP and found it unnecessary to consider the issue of the contravention of the zoning by-law.

While this court should not readily substitute its discretion for that of a judge of first instance, s. 26(3) of the Act clearly contemplates that this court can substitute its opinion for that of the judge. In the present case I believe that this court should so substitute its opinion.

In my opinion, the issuance of the building permit was a clear violation of the zoning by-law. The objection by FMP was not in "a battle that they had fought and lost" in the same sense as in Parklands. In the present case FMP has lost a decision made by the City but one that has not been considered by any outside body. The objection to the building permit is in the same battle.

FMP has a legitimate interest not only in preserving the parkland but is reasonably aggrieved by the issuance of the building permit because it is deprived of its right to oppose any rezoning by-law before the OMB. Their objection is not a last minute, last ditch fight made without good faith as was the case in Parklands.

For these reasons the appeal should be allowed, the order of Carnwath J. should be set aside and the decision of the Chief Building Official to issue Building Permit No. D17086 should be rescinded.

The appellant should have its costs fixed at $4,000 payable by the City and $1,000 payable by the hospital.

Appeal allowed.

Lofaro v. North York (City) Chief Building Official

Between
Joseph Lofaro, Applicant, and
E. Yaman Uzumeri, Chief Building Official and Building Commissioner of The City of North York, Respondent

[1992] O.J. No. 1493
DRS 93-00587
Action No. 17/91 and 439/91

Also reported at:
11 M.P.L.R. (2d) 278

Ontario Court of Justice - General Division
Toronto, Ontario
Sheard J.
July 14, 1992

K.D. Jaffary, Q.C., for the Applicant.
I.M. Shachter, for the Respondent.

SHEARD J.:-- These two applications were presented together. I will deal with them in the order in which they were originally filed. The parties are the same in both applications and both involve the same property.

In his application numbered 17/91, filed January 10, 1991, Mr. Lofaro seeks an order rescinding the revocation by Mr. Uzumeri, the Chief Building Official of the City of North York, of a building permit issued to Mr. Lofaro on January 25, 1990. This permit was revoked on July 6, 1990.

The notice of application cites the relevant sections of the Ontario Building Code Act, R.S.O. 1980, c. 51, those being sections 6(4) and 15:

s. 6(4) Subject to section 15, the chief official may revoke a permit,

(a) where it was issued on mistaken or false information;

(b) where, after six months after its issuance, the construction or demolition in respect of which it was issued has not, in the opinion of the chief official, been seriously commenced; or

(c) where the construction or demolition of the building is, in the opinion of the chief official, substantially suspended or discontinued for a period of more than one year.

s. 15 (1) Any person who considers himself aggrieved by an order given or a decision made by an inspector or chief official under this Act or the regulations may, within twenty days after the order of decision is made apply to the judge of the county or district court for a hearing and appeal.

(2) [Not applicable here.]

(3) Where an application is made to a judge for a hearing under subsection (1), the judge shall appoint a time for and hold the hearing and may rescind or affirm the order or decision of the inspector or chief official or take such action as the judge considers the inspector or chief official ought to take in accordance with this Act and the regulations, and for such purposes the judge may substitute his opinion for that of the inspector or chief official.

(4) [Not applicable here.]

(5) A judge to whom application is made for a hearing under subsection (1) may extend the time for making the application either before or after expiration of the time fixed therein where he is satisfied that there are prima

facie grounds for granting relief to the applicant pursuant to a hearing and that there are reasonable grounds for applying for the extension and may give such directions as he considers proper consequent upon the extension.

The subject property is municipally known as 752 Glengrove Avenue, on the north side of the street. The existing house in 1989 was a bungalow. Mr. Lofaro wished to renovate this house extensively, for the use of him and his family. In April, 1989, he obtained approval from the Committee of Adjustment for three minor variances, to add an extension at the rear and to change the house from a bungalow to a two-storey dwelling. These variances all involved setbacks, as follows:

1. Front yard setback of 5.44m (whereas the bylaw required 5.75m.)

2. West side yard setback of 1.03m (whereas the by-law required 1.8m.)

3 East side yard setback of 1.25m (whereas the by-law required 1.8m.)

Mr. Lofaro is a building contractor and intended to oversee the construction work himself. In the course of the summer of 1989 he decided to revise the plans, to make the house larger. He applied again to the Committee of Adjustment, requesting four further variances for the proposed additions:

1. Length of dwelling approximately 20.14m (whereas 16.8m is permitted.)

2. Lot coverage of approximately 41.98%

3. Front yard balcony area of approximately 18.76m2 (whereas a maximum balcony area of 3.8m2 is permitted.)

4. Rear yard balcony area of approximately 23.2m2 (whereas a maximum balcony area of 3.8m2 is permitted.)

The Committee of Adjustment refused this application, upon the grounds that the variance was not minor, was not within the general intent of the zoning by-law and was not an appropriate development of the property.

Mr. Lofaro revised his plans to accord with the variances that had been granted to him on his earlier application and he was issued a building permit in January, 1990.

Work began in May, 1990; the demolition and excavation part of the work began on June 26. The next day the east and west walls were demolished. On July 3 Mr. Lofaro had a meeting with Mr. Uzumeri in which he explained that the demolition of these walls had been done by mistake by an employee of Walter's Demolition, the demolition and excavating contractor hired by Mr. Lofaro.

Mr. Uzumeri accepted Mr. Lofaro's explanation of how these walls had been demolished and authorized the continuation of the excavation and construction under the building permit.

The next day, July 4, the west foundation wall was removed and replaced by a new wall eight inches further back from the lot line to give extra clearance to the gas line. Mr. Lofaro explains in his affidavit that he authorized this to be done because the excavating had disclosed that the western wall was structurally unsound. In his affidavit he says that he telephoned the building inspector to discuss the problem of this wall but that he was told the inspector was out on inspections and could not be reached and that he gave the instructions to remove this wall because the contractor was moving on to another site the next day and Lofaro could not afford the delay or the expense of hiring a new contractor.

In his affidavit, the building inspector, Michael Liao, says that when he attended the site on June 27 he found that a major portion of the foundations and footings and basement

slab had been removed, and all of the floor joists of the house, as well as the east and west walls. The building permit plans show that the foundations, footings, basement slab floor joists and east and west first floor walls were to remain. Mr. Uzumeri, in his affidavit, says that when Mr. Lofaro met him on July 3 regarding the demolition of walls, Mr. Lofaro did not mention the removal of the portions of the foundation, nor of the footings, basement slab, and floor joists.

In his affidavit Mr. Liao says that he attended the site on July 4 at approximately 10:00 a.m. and saw that the foundation and footings had been demolished, leaving only a short length of foundation on the east side of the project; that the interior of the project had all been removed. Attached as Exhibit B to Mr. Liao's affidavit are two photographs which he says he took at approximately 10:00 a.m. July 4, 1990, showing what appears to be a below-grade excavation with a section of block foundation wall showing.

Further photographs, which Mr. Liao says he took on August 16, are attached to his affidavit as Exhibit C, showing newly constructed foundation walls built in the excavation, which photographs, Mr. Liao attests, accurately represent the state of the project as at July 6, the date on which Mr. Uzumeri revoked the building permit and work ceased.

It is common ground that the section of the east foundation wall, approximately 23 to 24 feet long, was all that remained of the original building after the completion of the demolition stage of the project, at which point reconstruction began, continuing briefly until the Notice of Revocation of the building permit was delivered to Mr. Lofaro July 6.

Mr. Uzumeri's decision to revoke the building permit was made (according to his affidavit) on the basis of information given to him by Bill Ross, the senior residential plan examiner, "that virtually all of the foundation, footings, basement slab and floor joists for the house were gone, the debris had been cleared away and workmen appeared to be in the process of building a new foundation in non-compliance with the Building Permit Plans."

Mr. Ross, in his affidavit, refers to his having attended at the site on July 4 at approximately 12:30 p.m. in consequence of a report to him from Mr. Liao. Mr. Ross's description of the site as he found it on July 4 is the same as in Mr. Liao's affidavit and he confirms the accuracy of Mr. Liao's two July 4 photographs except that at the time of his attendance workmen appeared to be laying blocks on tap of the footings at the rear of the project.

Mr. Uzumeri in his affidavit says "...it is my opinion that Mr. Lofaro is not adding an addition to his house but, in fact, is building a new house under the guise of constructing an addition to the existing house."

Mr. Schacter submits that the extent of the demolition was so extensive that an inference can be drawn that it was intended by Mr. Lofaro at the outset to simply demolish the existing house and build a new one.

As indicated, there are areas in which the affidavits filed on each side are in conflict as to the facts. The notable example is Mr. Lofaro's account (in his affidavit sworn January 3, 1991) of the circumstances attending the demolition of the western foundation wall on July 4, 1990. He attests that on that day he was on site and observed the foundation wall beginning to crack and fall inwards; that after consultation with his contractor, Terry Walters, he decided the wall was structurally unsound and would have to be replaced; that he telephoned the building inspector (whom on cross-examination he said was Michael Liao) but could not reach him, so he decided the demolition and reconstruction of the foundation wall had to go ahead.

By contrast, Mr. Liao attests that at 10:00 a.m. of that day, July 4, he took two photographs, one of which shows the western foundation wall gone. Mr. Ross confirms those photographs, from his attendance on the site which he attests was at approximately 12:30 p.m. the same day.

This conflict between the affidavit of Mr. Lofaro and

those of Mr. Liao and Mr. Ross is but one example of areas in which factual issues are apparent.

What is the fundamental issue is whether or not Mr. Lofaro provided false information as to his construction plans at the time that he applied for the building permit that was issued to him. Mr. Uzumeri, on the basis of the sequence of subsequent events recounted to him by the building inspector, Mr. Liao, and by the senior residential plan examiner, Mr. Ross, has concluded that Mr. Lofaro did provide false information; that his intention was to build a new house "under the guise of constructing an addition to the existing house."

It is clear that there was evidence presented to Mr. Uzumeri that can justify the conclusion he reached, and accordingly justify his revocation of the building permit.

It is not possible for me, on the basis of affidavits, even including transcripts of cross-examination on those affidavits, to reach factual conclusions as to matters that remain in factual conflict.

The decision reached by Mr. Uzumeri appears to me to have been made responsibly in the discharge of his duty as chief building official, and on the basis of evidence which reasonably led to his conclusion.

The facts here are similar to the facts in Re Budman and Corporation of the Town of Gravenhurst, et al. (1983), 24 M.P.L.R. 195 (Divisional Court) where a builder's permit was issued to permit an addition to an existing cabin (pursuant to a minor variance granted by the Committee of Adjustment) and the building permit was revoked when the former building was demolished except for some building blocks lying on the ground that had formed its foundation. The basis of the revocation there, as here, was s. 6(4)(a) of the Building Code. The Divisional Court dismissed the appeal from the decision of the District Court judge who refused to restore the permit.

The application for an order rescinding the revocation of the building permit is dismissed. It is not necessary to address the issue of the request for an order extending the time for making the application.

Mr. Lofaro's second application, file numbered 439/91, is an appeal from the refusal to issue either one of two further building permits sought by Mr. Lofaro.

The first of these was a permit applied for by Mr. Lofaro May 15, 1991, to reconstruct demolished walls and foundations (the "reconstruction permit"). This branch of the appeal need not be considered further, as a result of my dismissal of Mr. Lofaro's application seeking rescission of the revocation of the original building permit (issued January 25, 1990). The reconstruction permit, if issued, would have been supplementary to the original building permit; it could not function standing alone.

The second branch of appeal numbered 439/91 arises from Mr. Lofaro's application, dated June 18, 1991, for a permit to construct a complete house (the "house permit"). This application was refused July 10, 1991.

The sequence of events and decisions that led up to this appeal includes the following:

In August, 1990, the month following the revocation of the original building permit, Mr. Lofaro applied to the Committee of Adjustment for minor variances to permit the foundation walls to remain as constructed as well as reconstruction of first floor walls. This application referred to the previously approved second storey addition and a twostorey addition to the rear. The variances requested were to permit side yard setbacks (both east and west sides) and front yard setback less than required by the applicable by-law.

It should be noted that in April, 1990, a new by-law, number 31181 (and related by-laws 31182 and 31183), were passed by the City of North York. This by-law, among other provisions, increased the front yard setback from 5.75m to 7.5m. It did not alter the sideyard setbacks.

Mr. Lofaro's fresh application for minor variances was

adjourned by the Committee of Adjustment from time to time, in the course of which new elements were added (dwelling height and driveway slope) which Mr. Lofaro asserts were injected by committee members, not requested by him.

On October 4, 1990, the Committee of Adjustment refused the application, stating as its reasons that "the variance is not minor, is not within the general intent of the Zoning By-law and Official Plan and is not an appropriate development of the property."

The variances shown in the decision as having been requested are the following:

1. Front yard setback of approximately 5.44m to proposed additions WHEREAS 7.5m is required;

2. West side yard setback of approximately 1.2m to proposed additions WHEREAS 1.8m is required;

3. East side yard setback of approximately 1.25m to proposed additions WHEREAS 1.8m is required; and

4. Dwelling height of approximately 10.14m WHEREAS 8.0m is required.

As has been mentioned the new by-law 31181 increased the front yard setback to 7.5m. Requested variance number 1 reflects this change; the variance previously granted by the Committee of Adjustment on April 20 1989 was the same 5.44m from 5. 75m. The requested variance number 2, of 1.2m on the west side appears to reflect the slightly relocated west wall which Mr. Lofaro had built 8 inches or so farther in from the lot line than the wall he had removed. The April 20, 1989 variance had permitted a west side yard setback of 1.03m.

The requested variance number 3 (east side yard setback of 1.25m versus 1.8m required) was identical to the variance granted in April, 1989. It is not altogether clear why Mr. Lofaro applied a second time for this variance, in view of his submission that the original variances continued in force. The words "to proposed additions" indicate the basis on which the application was made, although that phrase would appear to be inappropriate considering the virtually total demolition of the original building by July, 1990.

The inclusion of a requested height variance is disavowed by Mr. Lofaro, as has been mentioned.

Mr. Lofaro appealed the October 4, 1990 refusal of the Comments of Adjustment to the Ontario Municipal Board. In addition, he also joined other landowners in a multi-faceted appeal to the O.M.B. of the new By-laws 31181, 31182 and 31183.

The Board that decided the last mentioned appeal was composed of Messrs. P.H. Howden and C.A. Harrow The lengthy decision of the Board, dealing with the numerous appeals before it, was delivered by Mr. Howden on March 27, 1991. This decision exempted the Lofaro property from By-law 31181, subject to certain conditions.

The Board that decided Mr. Lofaro's appeal from the refusal of the Committee of Adjustment to grant him variances gave its decision the following week, on April 2, 1991, per Mr. M.A. Rosenberg, one of the members who sat on that appeal. Although Mr. Rosenberg refers to Mr. Howden's decision, he dismisses Mr. Lofaro's appeal from the Committee of Adjustment's refusal to grant the variance from the previous By-law 7625, for the same reasons as given by the Committee of Adjustment.

Mr. Howden ordered that Mr. Lofaro's property be exempted from the By-law 31181 changes, provided that (i) the building permit application and permit are to be strictly in compliance with the plans submitted for the original building permit, and (ii) the house is in the same location on the lot as in those plans.

Mr. Howden's reasons for the Board's decision are as follows:

It is settled beyond all doubt that the building plans, with which the Lofaros wish to proceed (Exhibit 11) are

exactly the same plans which were before the Committee of Adjustment when their variance application was approved and which were reviewed in full by the City and approved in all respects. The building permit issued well before the by-laws now before the Board were passed. The only reason for this house not being completed is the accidental slippage of one wall from the former house. As a result the permit was revoked and the City refused to issue another due to the intervening passage of By-law 31181, which alters the former law on substantial demolition.

The Board finds that this matter falls within the fairness principles used by the City to grant the three exemptions in By-law 31183. The plans and application went through a full public process prior to By-law 31181 and were fully approved before enactment of that bylaw. The only difference will be that one wall will not be the pre-existing wall from the former house on the site; its replacement is to be in exactly the same location.

The understanding of the facts on which that Board's decision was based is clearly incorrect as to the extent of the demolition. Whether that Board would have reached the same conclusion on a more accurate understanding of the facts can only be speculated on. By comparison, the summary contained in the decision of the differently constituted Board on April 2 appears to be based on an accurate understanding of the facts.

While this application cannot involve a review of either of the Board decisions, they are each referred to and relied upon by the parties in this application and I do not think it is inappropriate for me to make the foregoing comments as to these disparate decisions.

The essential issue here is whether the original variances granted by the Committee of Adjustment, on which the now revoked building permit was granted, can still be relied on by Mr. Lofaro.

The March 27, 1991 Ontario Municipal Board order exempts the projected building from By-law 31181, provided it complies with the plans approved on January 24, 3990, and the house is located on the lot as those plans and the Committee of Adjustment decision of April, 1989, contemplates.

Notwithstanding, it is still necessary to comply with Zoning By-law 7625. The position of Mr. Uzumeri in effect is that the 1989 variances are now defunct, because of the virtually total demolition of the building. Mr. Lofaro's answer is that the variances were not granted subject to any conditions and that the house he wishes to build is the same house as he originally sought to build.

It is significant that the original variances were each described in the decision of the Committee of Adjustment as setbacks "to the existing dwelling," with the word "existing" in the decision emphasized by underlining. The variances were sought for an existing dwelling; they were granted for an existing dwelling. While, as Mr. Jaffary says, the variances were not made subject to explicit conditions, the references to an "existing dwelling" virtually amount to making it a condition that the variances be implemented, not at large, but in reference to the existing dwelling. That dwelling ceased to exist, except for a fragment of foundation wall, as a result of the demolition during the last week of June and the first week of July, 1990. After that it would seem to me to be of dubious relevance to seek to determine what part of the demolition was by accident and what part by intention. It is clear from the evidence presented by Mr. Lofaro d that he intended the major demolition as being at least an implicit requirement of his submitted plans, notwithstanding that those plans showed parts of the house which were to remain which he said on cross-examination were so shown in error and that he would have deleted such references if he had noticed them in the plans.

Whatever the reasons, the dwelling no longer exists.

In his submission Mr. Jaffary referred to the judgment of Judge Gibson (as he then was) in Molyneux v. Nixon (unreported, reasons delivered orally July 2nd, 1986.) In that case the owner applied for an order authorizing changes in the

construction of substantial alterations to a dwelling which was being converted from a bungalow to a larger two-storey house. The respondent chief building official asked Judge Gibson to revoke the building permit as having been issued on the basis of mistaken or false information. Judge Gibson declined to revoke the building permit and granted the authorizing order requested by the owner.

There are important factual differences between Molyneux v. Nixon and the case before me, including that the demolition in Molyneux was envisaged under the permit and that the building had been substantially completed and was being lived in before the case came before Judge Gibson. There are no principles stated by Judge Gibson which come into play in the application before me and despite a superficial factual similarity there are factual differences which lead me to a different conclusion.

In my opinion the refusal to grant the building permit applied for June 18, 1991 (the "house permit") was justified. This application accordingly must be dismissed.

The costs of both applications should follow the event and be to the respondent, subject to submissions of counsel if requested, including submissions directed to having me fix the costs rather than having the costs otherwise assessed. If so, arrangements can be made through my secretary for me to hear submissions.

B. Duxbury, for the applicants.
R.T. Beaman, for the respondent.

MACKENZIE J.:--

NATURE OF THE PROCEEDINGS

[para1] The Corporation of the City of Mississauga (the City) and Agris Robeznieks, the chief building official for the City (the C.B.O.), bring an application pursuant to s. 38(1) of the Building Code Act, S.O. 1992, Ch. 23; s. 328 of the Municipal Act, R.S.O. 1990, Ch. M.45, as amended, and Rule 14 of the Rules of Civil Procedure. In the application, the City and the C.B.O. seek various heads of relief by way of restraining and mandatory orders pertaining to the use and occupation of certain premises in the City of Mississauga owned by the respondent. The grounds for the relief are centred essentially upon the alleged non-compliance by the respondent with the Building Code and land use control by-laws of the City of Mississauga, all in relation to two parcels of real property owned by the respondent in Mississauga.

[para2] By agreement, counsel for the applicants and the respondent have limited the scope of matters for determination at this stage in the proceedings as to whether or not at the material times there were more than two dwelling units in one of the subject parcels; namely, 1168 Stavebank Road, Mississauga (the premises) and as to the effect on the premises of the Building Code Act, the land use control/zoning by-laws of the City and Ontario Regulation 384/94 under the Planning Act.

FACTUAL BACKGROUND

[para3] There are several undisputed facts in the evidence elicited on this application:

1. The building on the premises has from its inception been used for residential purposes and was used as a single family residence immediately following its construction.

2. The designated land use for the premises and the building is contained in the City's zoning provisions designated as R1-section 1821 of Mississauga By-law 247 of '94, enacted May 25, 1994 (The By-law).

3. The respondent and her late husband acquired title to the premises on or about the 3rd of July, 1987.

4. At the time of acquisition of the premises, two self-contained dwelling units, i.e. with no access by either of them to the other, were within the building on the premises.

5. At some time following their acquisition of the property, the respondent and her late husband (who died in December of 1994) arranged for two additional self-contained units to be created so that prior to 1990, there existed four self-contained dwelling units within the subject building, two at the front of the building on an upper level and two at the rear of the building on a

lower level.

6. Following a complaint in 1995 from a neighbour of the respondent's premises, the City's building department became involved and determined that renovation construction to the building on the premises was being undertaken by the respondent without a building permit.

7. In July of 1995, the respondent applied for and obtained a building permit for the premises dated July 19, 1995. In the application for the building permit, the following particulars apply:

> "Class of permit - structural component
> Permit type - detached dwelling
> Scope - additions and alterations
> Comments - rear addition."

The type of permit, scope of permit and comments in the issued permit, were identical to those items as set out in the application.

ISSUES

[para4] As indicated in the introductory paragraph of these reasons, the court will only make factual findings relating to the number of dwelling units in the building on the premises at the material time and the construction of the applicable laws to such findings of fact.

[para5] In the result, the only issue for determination and ruling at this time is the number of residential dwelling units permitted to continue in the building on the premises.

ANALYSIS

[para6] In order to make such determination and ruling, it is first necessary to determine,

1. the number of residential dwelling units in the subject building on the premises prior to the respondent's acquisition of title to the premises in July of 1987; and

2. the number of residential dwelling units in the subject building prior to November, 1990 and prior to the coming into force of Ontario Regulation 389/94 and the construction without permit by the respondent of the alterations to the subject building in the late spring and early summer of 1995.

[para7] As previously indicated, the evidence is uncontroverted that the subject dwelling, although designed as a single family dwelling, had "at some point in time, an apartment added in the lower south portion of the house." (Affidavit of Irwin Aubert, a neighbour of the respondent who has been living across the street from the premises within sight of the subject building since 1943.) In addition, Mr. Aubert in his affidavit states that after the respondent's late husband purchased the premises, he did renovations to the premises and that there were "two separate units in the lower rear portion of the house facing the Credit River." In addition, there is an affidavit by another neighbour, Mr. Robert Hurley whose residence is located three doors to the north of the subject property, and who moved into his residence about 1985. Mr. Hurley states in paragraph 2 of his affidavit, the following:

> "A year or two after I moved into the area, the house at 1168 Stavebank Road [the subject building] was renovated and used by many different tenants. I became aware of four units in the building, two located in the upper level at the front and two located in the lower level facing the rear."

[para8] I turn to the first question; namely, what were the number of residential dwelling units in place in the subject building prior to November 12, 1990 and the late spring or early summer of 1995.

[para9] The evidence contained in the affidavits of Mr. Aubert and Mr. Hurley has not been challenged or contradicted

in any respect. The affidavits of one Janette Banks, a neighbour of the respondent, and Joyce LeChasseur, a current tenant of one of the dwelling units in the subject dwelling, are less clear as to the number of dwelling units that existed in fact prior to November of 1990. I am nonetheless satisfied on all the evidence that the subject building, at some point following its construction and prior to 1953, was converted from a single dwelling unit building to a double dwelling unit building and that, at some time between July of 1987 and November of 1990, there were an additional two units added to the subject building. I further find as a fact that a fifth dwelling (or so-called "loft") unit was added sometime during the summer of 1995.

[para10] I turn now to the second question, viz, the effect of the governing law on these findings of fact.

[para11] The governing law is as follows.

1. The City's by-law provides for permitted uses in R1 zones as follows:

   S. 39 "R1 ...: 1. Any person may:

   (a) erect or use a one-family detached dwelling on a lot."

S. 1821 provides as follows:

"Notwithstanding their 'R1' zoning, the lands delineated as 'R1-Section 1821' on Schedule 'B' of this by-law shall only be used in compliance with the R1 zone provisions contained in this by-law except that:

1. [specifications for minimum total width of side yards]

2. [specifications for maximum dwelling unit heights]

3. [maximum distance between established grade and lower edge of the eaves of any dwelling unit]

4. [maximum gross floor area of dwelling units on each lot]

5. [definition of gross floor area for purposes of section 1821]

6. Notwithstanding any provision of this by-law to the contrary, any dwelling unit in existence on or before the day this section comes into force (1990 November 12), any dwelling unit for which a building permit has been issued on or before the day this section comes into force, or any dwelling unit for which a site development plan has been improved and for which a building permit application has been made on or before the day this section comes into force are considered to be in compliance with the zone provisions contained in this section. [my emphasis]

[para12] The Land Use Planning and Protection Act, S.O. 1996, c. 4, by section 42 thereof amended the Planning Act by adding to the Planning Act the following section:

S.76(1) If on November 16, 1995 a detached house, semi-detached house or row house was used or occupied as two residential units, section 1, subsection 16(2), (3) and (4), 31(3.1) and (3.2), 35(1), (3) and (4) and 51(28), (29) and (30) of the Act and Ontario Regulation 384/94, as they read on November 15, 1995, continue to apply to that house. [my emphasis]

[para13] In June of 1994, Ontario Regulation 384/94 made under the Planning Act dealing with apartments in houses came into force. The pertinent parts of the Regulation provided for "Classes of Houses" in s.2(1), as follows:

S.2(1) Subject to subsection (2), clause 16(2)(a), section 31(3.1) and clause 35(1)(a) of the Act apply to the following classes of houses:

1. A detached house if it occupies the whole of a building;

2. A semi-detached house if,

(i) it occupies part of a building, where the remainder of the building is occupied by another semi-detached house and the two houses are divided on the vertical plane in such a manner that there is no internal access from one semi-detached house to the other, and

(ii) it has not been created through the alteration of a detached house.

[para14] In applying the applicable law to the present fact situation, the applicant contends that the language of the by-laws which operate in restraint of individual property rights should be given a liberal interpretation to the end that the by-law furthers the purpose of protecting the community against departures by individuals in that community from the standards which the municipal council of the community has adopted. In support of this broad proposition, the applicant refers to the case of Woodglen and Co. Ltd. v. City of North York (1994) M.P.L.R. (2d) 219 (Ont. Ct. (Gen. Div.)) at pp. 226 and 227. The respondent submits that in applying and interpreting municipal zoning by-laws, the rule of interpretation should be strict construction against the municipal council that enacted the by-law and that if a municipal authority seeks to interfere with a property owner's rights, then any doubt in the construction of such an enactment should be resolved in favour of the property owner. In support of these propositions, the respondent cites R. v. Height (1963) 2 O.R. 471 (O.C.A) and Erith Corporation v. Holder, [1949] 1 All E.R. 389 (English Court of Appeal).

[para15] In approaching this task, I draw a distinction between interpretation and construction of legislative instruments. "Interpretation" deals with the meaning to be afforded to the words used in the enactment. "Construction" deals with the effect to be given to the words in the legislative enactment when the interpretation of such words is applied to the factual situation as found by the court. In the present circumstances, I encounter no problems of ambiguity or imprecision in the words utilized in the applicable enactments. It must also be kept in mind that the zoning by-law is not being impugned by the respondent; it is the proper construction of the zoning by-law, and of the Planning Act regulations, that is at issue in this motion.

[para16] The gist of the applicants' position, as I have understood the oral submissions, is that the relief afforded by subsection 6 of section 1821 of the zoning by-law relates only to the rigour of the by-law standards referrable to building and siting criteria but nothing to do with the number of units or the uses to which those units are put in any building to which the section applies.

[para17] The gist of the respondent's position, as I have understood from the oral submissions, is that the relief is afforded to any dwelling unit which [among other criteria] was in existence before November 12, 1990 if such dwelling unit was used for residential purposes. The respondent contends that if a dwelling unit or units are within these parameters of the subsection, then such unit or units are permitted by the by-law with respect to their residential use and the regulation of such residential use.

[para18] I have not been referred by counsel as to the definition "dwelling unit" for purposes of section 1821 or, indeed, for the rest of the provisions of the by-law dealing with R1 uses. In the result, I find that the words "dwelling unit" as used in subsection 6 of 1821 cannot be construed so as to encompass a "one-family detached dwelling on a lot" as referred to in section 39(1)(a) of the By-law. I further find that the four dwelling units in the subject dwelling unit were in situ as of the operative date, being the 12th of November, 1990, and, having been used for residential purposes at the material time, they are in compliance with the zoning provisions contained in section 1821.

[para19] I turn now to the fifth or "loft" unit. As previously indicated, it is not in dispute that this dwelling unit did not come into existence before the summer of 1995 and, thus, it does not have the protection afforded to the other four units. It is, however, the contention of the

respondent that Ontario Regulation 384/94 is protected by such Regulation. The respondent's position is that the regulations under the Planning Act, by virtue of the operation of section 31(3.1) and (3.2), have primacy in the event of any conflict between the land-use control by-law of a municipality and the Regulation. The gist of the position in this regard is that there is no definition of "house" contained in the Regulation but there is contained in subsection 2, which defines "classes of houses," a definition of semi-detached house. The respondent's submission is that the four units in the subject house meet the definition of "semi-detached house" on the basis that the four units, comprising two in the upper level and two in the bottom level, are divided by a vertical plane and that the semi-detached house is not being created through the alteration of a detached house. The applicant, in reply to this submission, contends that the facts respecting the creation of the four units do not meet the description of a semi-detached house in that each one of the dwelling units in the subject dwelling was created through the alteration of a detached house, i.e. the original building was initially designed and used as a single or one-family dwelling occupying the whole of a building. In addition, the applicant contends that to give effect to the construction sought by the respondent would enable an owner in the position of the respondent to artificially create new "semi-detached houses" so as to thereby provide a basis to bootstrap "second units" within the same building.

[para20] Notwithstanding the ingenious submission of counsel on behalf of the respondent in this matter, I am persuaded that a purposive interpretation and construction of the definitions of classes of houses, particularly as it relates to semi-detached houses, is in favour of the City's position. In my opinion, the scheme of the other sections in Regulation 384/94 and the references in such sectors to "second units" militates against any construction that would give effect to what might be construed as an arithmetic progression by an owner seeking to bootstrap "second units" within the footprint of a single building. I find that the creation of the fifth unit did not arise through the alteration of a detached house which occupied the whole of a building.

Disposition

[para21] In the result, the Court declares that the four dwelling units in the subject building, other than the loft unit, are the maximum number of permitted uses and that the loft unit in the subject building is not a permitted use.

[para22] It should be noted that the foregoing declaration shall be without prejudice to the positions of the parties respecting the prosecution of the Respondent by the City under the Building Code Act and the Municipal Act.

[para23] As there have been novel issues raised as to the construction of Reg. 384/94, in this motion, there will no order as to costs.

Richard Storrey and Julia Ryan, for The Erin Mills Development Corporation.
Gerald S. Swinkin, for Macmeadow Developments Inc.

The following judgment was delivered by

[para1] THE COURT:-- The issue in this appeal is whether the Ontario Municipal Board (hereafter OMB) erred in law in finding that there was no jurisdiction under the Planning Act for the approval authority (the City of Mississauga) to impose the condition, which is the subject of this appeal, on developers.

[para2] The condition which the City sought to impose on each of the respondent developers' four draft plans of subdivision reads:

> "Prior to final approval, the City [of Mississauga] shall be advised by the School Boards that satisfactory arrangements regarding the adequate provision and distribution of educational facilities have been made between the developer/applicant and the School Boards for this plan."

[para3] The OMB required the School Boards to file written explanations outlining the method by which the condition was to be fulfilled and counsel on their behalf responded as follows:

> "What Your Clients Must Do
>
> Further to the explanation given last week at the Ontario Municipal Board, the School Boards require that the building of dwelling units on the lands which are the subject of the four plans of subdivision now before the Ontario Municipal Board be staged over a period of at least eight years. Therefore, the School Boards will require that each of your clients agree, as part of a

subdivision agreement with the City of Mississauga, that building permits for no more than 423 dwelling units in the aggregate shall be issued with respect to all the subject lands in any year following registration of any of the subject plans of subdivision. If building permits for fewer than 423 dwelling units are issued in a year, the difference can be carried forward to subsequent years.

Upon the execution of a subdivision agreement between the City of Mississauga and a landowner incorporating these terms, the School Boards will advise that the condition has been satisfied with respect to that landowner."

[para4] The necessary first step in determining whether or not jurisdiction exists is a consideration of the language of the statute itself. It is trite to say that a statute is to be interpreted in accordance with its stated purpose and in the normal course and where it is possible to do so, the language used is to be given its usual and commonly understood meaning. The stated purposes of the Planning Act are set out in section 1.1 of the Act and include:

"(e) to encourage co-operation and co-ordination among various interests;"

[para5] It is submitted by the appellant that what this condition purports to accomplish is the co-ordination of the development of residential lands with the provision of adequate school facilities for students living in the subdivisions. The developments in the result will be "staged" or "phased".

[para6] Section 2 of the Act requires that various approval authorities, in carrying out their responsibilities under the Act, shall have regard for matters of provincial interest such as:

"(i) the adequate provision and distribution of educational, health, social, cultural and recreational facilities;

(m) the co-ordination of planning activities of public bodies;

(n) the resolution of planning conflicts involving public and private interests;"

[para7] Section 51 of the Act deals with plan of subdivision approvals and subsection (16) thereof provides that an owner of land may apply to the approval authority for approval of a plan of subdivision of the land or part of it. This section goes on to provide in subsection (20) thereof that an approval authority, before making any decision to approve or refuse to approve a draft plan of subdivision, shall ensure that notice of the application is given to such persons and public bodies as is required by regulation and

school boards are among those required to receive such notice. The following subsections of section 51 are also relevant to the issues raised:

(23) The approval authority may confer with the persons or public bodies that the approval authority considers may have an interest in the approval of the proposed subdivision.

(24) In considering a draft plan of subdivision, regard shall be had, among other matters, to the health, safety, convenience and welfare of the present and future inhabitants of the municipality and to,

(a) the effect of development of the proposed subdivision on matters of provincial interest as referred to in section 2;

(j) the adequacy of school sites;

(25) The approval authority, may impose such conditions to the approval of a plan of subdivision as in the opinion of the approval authority are reasonable, having regard to the nature of the development proposed for the subdivision, including a requirement, ...

(d) that the owner of the land proposed to be subdivided enter into one or more agreements with a municipality ... dealing with such matters as the approval authority may consider necessary, including the provision of municipal or other services.

(26) A municipal or approval authority, or both, may enter into agreements imposed as a condition to the approval of a plan of subdivision ...

(31) The approval authority may give or refuse to give approval to a draft plan of subdivision.

[para8] The obvious purpose for providing public bodies with notice of applications for approval of proposed draft plans of subdivision as well as the provision of authority for the approval authority to confer with public bodies is to obtain the input of such bodies in relation to those draft plans. To suggest that the municipality can do nothing with any such information received from affected school boards would be to render the language of the statute meaningless and without purpose. That cannot have been the intention. Subsection (24) mandates that regard be had not only for the present but also for the future inhabitants of the municipality. Additionally this subsection requires that again in relation to the proposed draft plan, those matters of provincial concern enumerated in section 2 of the Act be considered. This of course includes ... "the adequate provision and distribution of educational ... facilities" in addition to the "adequacy of school sites" specifically enumerated in paragraph (j) of that same subsection. The obvious difference in the choice of language used by the legislature cannot be ignored and in our view "the adequacy of school sites" and "the adequate provision and distribution of educational facilities" cannot and do not mean the same thing.

[para9] The respondents argue that when adequate school sites are reserved in a plan of subdivision that is sufficient to meet the approval authority's mandate to have regard for matters of provincial interest as set out in section 2 of the Act. They suggest the adequacy of sites together with the legislated funding formula provided under the Education Act for the construction of new schools where necessary is a complete answer. We do not agree. In our view the phrase "the adequate provision and distribution of educational facilities" must mean something more than or different from the phrase "the adequacy of school sites".

[para10] The funding formula for the construction of new schools has changed dramatically in recent times. School Boards no longer have the powers they once enjoyed to raise capital for the construction of new schools. Funding is now provided on the basis of the shortfall of permanent student places in any given year. That is to say, if a particular school district has, for example, 100 more students attending school than it has permanent (bricks & mortar) places for those students in a given year, funding will be provided for the construction of new permanent places on the basis of those 100 students. In other words, until the students are in actual attendance, no funding is available to accommodate them on a permanent basis.

[para11] As a practical matter, if all four plans of subdivision were to proceed at the same time, this would result in some 3,300 residential units, many of which would have living in them students who would attend local schools. The School Boards have indicated to the City that they have little or no room to accommodate more students in existing schools in the area. There will not be funding available to build schools until the students are in actual attendance and until such schools are built those students would have to be accommodated temporarily either in portables or some other temporary accommodation. It is self-evident that it would be a far easier task to accommodate a smaller rather than a larger number of students in any given year; some measure of order rather than complete chaos.

[para12] There is nothing in Condition 8 that relates to the funding formula set out in other legislation and in relation to which the appellants conceded the City has no jurisdiction. All this condition does is phase the proposed developments over time; it does not say there will be no development, it says only development will take place gradually.

[para13] In our view, the provisions of the Planning Act clearly give the City the jurisdiction to impose the condition.

[para14] Further, the OMB erred in law when it failed to ask itself the proper question, which is whether the legislation allows the approval authority to impose the subject condition on developers.

[para15] It is, we think, clear from their reasons (see page 58 through page 65 of the Appeal Book) that the OMB concerned itself with the effect of the condition, which in our view goes to the question of reasonableness, rather than whether the Planning Act provides the necessary jurisdiction to impose this condition in the first place. In the result, the appeal must succeed and the decision set aside.

[para16] The OMB bifurcated the process and purported to consider the jurisdictional issue separately from the reasonableness issue and in view of their conclusion reached on jurisdiction found it unnecessary to deal with reasonableness. Because the reasonableness (or lack thereof) has not been considered as yet, in view of our decision this matter must be remitted to the OMB. Counsel for the appellants ask that it go back to a board differently constituted whereas the respondents ask that, if it must be remitted, it go back to the same board to finish the task. The respondents say that this board has already heard evidence which would necessarily be repeated in proceedings dealing with reasonableness and that time investment should be considered by this court. While we agree that there could likely be a saving in time were the matter remitted to the same board, we are concerned that this particular board has already "tipped its hand", to borrow Mr. Pape's term, in relation to the reasonableness of the condition. Consequently, we think in all the circumstances that it is preferable to remit the matter to a differently constituted board and so order.

[para17] In conclusion, the appeal is allowed, the decision of the OMB set aside and this matter is remitted to a differently-constituted panel of the OMB for consideration of the reasonableness of the subject condition. Costs of this appeal and the leave application to the appellants fixed in the sum of $15,000.00.

Mississauga (City) v. Greater Toronto Airports Authority

Between
The Corporation of the City of Mississauga, applicant (appellant), and
Greater Toronto Airports Authority, Greater Toronto Airports Authority Associates Inc., Her Majesty the Queen in Right of Canada, Her Majesty the Queen in Right of Ontario, The Regional Municipality of Peel, Peel District School Board, The Dufferin-Peel Roman Catholic Separate School Board, Mississauga Hydro-Electric Commission and Nav Canada, respondents (respondents in appeal)

[2000] O.J. No. 4086
Docket Nos. C31539 and C31557

Ontario Court of Appeal
Toronto, Ontario
McMurtry C.J.O., Laskin and Charron JJ.A.
Heard: November 8-10, 1999.
Judgment: November 3, 2000.

On appeal from the judgment of Justice James C. MacPherson dated January 19, 1999.

Counsel:

Thomas G. Heintzman, Q.C., John P. Brown, Joseph J. Colangelo and Michael G. Kyne, for the appellant.

Brian Morgan and Mahmud Jamal, for the respondent Greater Toronto Airport Authority.

Chris G. Paliare and Andrew Lokan, for the respondent Nav Canada.

Peter Southey and Shelley Quinn, for the respondent Her Majesty in Right of Canada.

The judgment of the Court was delivered by

LASKIN J.A.:--

A. Introduction

[para1] The central question on this appeal is whether Parliament's exclusive legislative authority over aeronautics or federal undertakings or over federal Crown property precludes the City of Mississauga from regulating the construction of new buildings at Lester B. Pearson International Airport.

[para2] Pearson Airport is on federal Crown land, most of which is in Mississauga. Under separate leases with the federal Crown, the Greater Toronto Airports Authority ("GTAA") and Nav Canada operate the airport and the civil air navigation system.

[para3] Pearson Airport is already Canada's largest airport. Over the next two decades, however, the number of passengers and the amount of air cargo coming into and going out of the airport is expected to increase dramatically. To meet these increases, the GTAA and Nav Canada have begun a massive redevelopment project. The redevelopment includes the construction of a large new passenger terminal to replace Terminals 1 and 2, three new runways and a new air traffic control tower.

[para4] Mississauga contends that the Building Code Act, S.O. 1992 c. 23 and the regulation passed under it, the Ontario Building Code, apply to all new buildings constructed at Pearson Airport. It also claims that the GTAA and Nav Canada must pay development charges levied by Mississauga under the Development Charges Act, R.S.O. 1990 c. D-9 and the City's development charges by-law. Thus, the main issue in this litigation is whether Parliament's exclusive legislative authority in relation to aeronautics, federal undertakings or public property under the Constitution Act 1867 requires that the Ontario building code regime, which includes Mississauga's development charges, be read down not to apply to the construction of new buildings at Pearson Airport.

[para5] If Mississauga fails on these constitutional issues, it asks for a declaration that the GTAA is not entitled to rely on the National Building Code, a declaration that the GTAA and Nav Canada have a common law obligation to compensate the city in an amount equivalent to its development charges, and that failing payment, a declaration that the city

can refuse to provide fire and emergency services at the airport.

[para6] In thorough and well-written reasons reported at (1999), 43 O.R. (3d) 9, the applications judge, MacPherson J., decided all issues against Mississauga. Mississauga now appeals to this court and is supported by the Regional Municipality of Peel. The Attorney General of Canada supports the position of the respondents, the GTAA and Nav Canada.

[para7] Mississauga's appeal raises the following six issues:

1. Did the applications judge err in holding that Ontario's building code regime does not apply to the redevelopment of Pearson Airport because it would intrude into Parliament's exclusive jurisdiction over aeronautics?

2. Did the applications judge err in holding that Ontario's building code regime does not apply to the redevelopment of Pearson Airport because it would intrude into Parliament's exclusive jurisdiction over a federal undertaking?

3. Did the applications judge err in holding that Ontario's building code regime does not apply to the redevelopment of Pearson Airport because it would intrude into Parliament's exclusive jurisdiction over federal Crown property?

4. Did the applications judge err in holding that Mississauga had no standing to claim that the GTAA was not entitled to apply the National Building Code under s.14.03 of the Ground Lease between the federal Crown and the GTAA?

5. Did the applications judge err in refusing to grant a declaration that Mississauga is entitled to "fair, reasonable and equitable compensation" for its capital costs connected with the redevelopment of Pearson Airport?

6. Did the applications judge err in refusing to grant Mississauga a declaration that it is not required to provide fire and emergency services at Pearson Airport unless the GTAA and Nav Canada are required to pay the development charges levied by Mississauga?

[para8] For the reasons that follow, I conclude that MacPherson J. did not err on any of these issues. I would therefore dismiss Mississauga's appeal.

B. Background Facts

[para9] Pearson Airport is the largest airport in Canada and the seventh largest in North America. It occupies about 4,400 acres of land. But for a small portion in Toronto, all the airport land is in Mississauga. Indeed, the airport covers ten per cent of all the land in Mississauga. As MacPherson J. observed, the city and the airport enjoy a close relationship: residents of Mississauga work at the airport; in turn, the airport generates substantial revenues for the city.

[para10] Until about the mid-1990s, Pearson Airport was owned and operated by the federal Crown. In 1994, the federal Crown went from being an owner and operator of airports to an owner and landlord. That year, the Government of Canada published the National Airports Policy, which called for the commercialization both of Canadian air navigation and Canadian airport services. Under this policy, the federal Crown retains its control over aeronautics and maintains its role as regulator of air safety and security. But it now leases airports to private operators called Canadian airport authorities, which are "free to operate airports on a commercial basis".

[para11] The National Airports Policy led to the creation of the GTAA and Nav Canada. The GTAA is a private non-profit corporation. Its Board of Directors consists of nominees from the regional municipalities of Durham, Halton, Peel and York, the City of Toronto, the Province of Ontario and the federal government. GTAA Board members reflect the interests of business, organized labour and consumers. In December 1996, the federal Crown leased Pearson Airport to the GTAA under a

60-year Ground Lease. As the local airport authority, the GTAA's mandate is to manage, operate and develop the airport for the term of the lease.

[para12] Nav Canada is also a private non-profit corporation. Established under the Civil Air Navigation Service Commercialization Act, S.C. 1996 c. 20, the corporation has the exclusive right and obligation to own, operate and develop Canada's civil air navigation system. This system includes air traffic control systems and a variety of communication, navigation and information services provided to aircraft in Canadian-controlled airspace. These services are provided through numerous facilities across Canada, including seven air control centres, 81 flight service stations, one stand-alone terminal control unit and 44 air traffic control towers. At and around Pearson Airport is an extensive network of air navigation facilities including buildings, aeronautical radio antenna towers, and other radar systems and navigational aids, which are functionally integrated with other installations across the country to form a national system.

[para13] One of the facilities at Pearson Airport is the new air traffic control tower, the most technically advanced control tower in Canada. Development of the tower began in February 1995. The tower was built and operating by 1998. The federal Crown has leased the site for the control tower to Nav Canada under a sixty-year lease.

[para14] In 1997, Pearson Airport handled about 26.1 million passengers and approximately 379,000 tonnes of air cargo. Huge increases in these numbers are forecast. Passenger use is expected to rise to 28 million annually by this year, to 36 million by 2010 and 50 million by 2020. Air cargo traffic is expected to grow by 3.8 per cent annually until 2005 and by 2.5 per cent after 2005. To meet this growth, the GTAA and Nav Canada have begun the redevelopment project that is the subject of this litigation. The redevelopment has four parts:

(i) The airside development project: The purpose of this project is to increase airfield capacity and operational efficiency at Pearson Airport. In addition to the new air traffic control tower constructed by Nav Canada, this project includes three new runways and associated taxiways at an estimated cost of $362 million, a new six-bay de-icing facility, and an advanced aircraft surface monitoring and guidance control system to increase airport capacity during poor weather.

(ii) The terminal development project: Under this project, Terminals 1 and 2 will be replaced with a single terminal on the same site, five times the size of the two existing terminals. The new terminal will include a three-level road system, a new integrated ground transportation facility and a multi-level 12,500-space public parking garage. It is estimated to cost $2.55 billion.

(iii) The infield development project: This project is designed to meet the demand for ancillary aviation facilities and to accommodate tenants who will be relocated because of the terminal development project. Air cargo and flight kitchen tenants will be relocated to a multi-tenant air cargo complex and separate flight kitchen facilities on the infield between the runways. A new hangar will be built for 747 aircraft. New access routes will link the infield with the passenger terminal apron and with the highway system to the west of the airport.

(iv) The utilities and airport support system: This project will provide an expanded electrical network, new heating, roofing and sewage systems, improved telecommunications, and fire-fighting facilities for the airport.

[para15] When completed, this massive redevelopment will equip Pearson Airport to handle up to 50 million passengers annually.

[para16] Mississauga contends that the GTAA and Nav Canada require building permits to construct these new facilities. Under the city's development charges by-law, to obtain building permits the GTAA and Nav Canada must first pay the

city's development charges. Mississauga says the redevelopment of the airport will impose a greater burden on the city's municipal services, especially road, storm, water, fire and emergency services. Before the litigation began, Mississauga claimed development charges of $14.5 million; during the litigation, Mississauga revised its claim to approximately $47.3 million. Mississauga is also responsible for collecting development charges levied by the Regional Municipality of Peel.

[para17] The federal Crown disputes Mississauga's constitutional jurisdiction to impose the Ontario Building Code and its development charges by-law on the redevelopment of Pearson Airport. Nonetheless, the federal government's standard practice is to require all contractors building aviation facilities on federally-owned land to apply for a municipal building permit or to at least tender an amount equivalent to the building fee to the appropriate municipality. The federal government refers to this policy of voluntary compliance as its "good neighbour policy". It has adopted this policy as a courtesy to municipalities so they may be consulted about any aviation-related construction. Thus, for example, in 1996, Transport Canada applied to Mississauga for a building permit for the new air traffic control tower and tendered the permit fee of approximately $36,000. Mississauga, however, demanded payment of development charges of approximately $150,000 before issuing a permit. Transport Canada refused to pay these charges and a permit was never issued. The impasse over whether Mississauga can impose development charges on the redevelopment of Pearson Airport precipitated this litigation.

C. The Statutory Scheme

1. The Provincial Regime

[para18] This litigation challenges the application to Pearson Airport of two Ontario statutes, the Building Code Act and the Development Charges Act.

[para19] Every municipality in Ontario must comply with the Building Code Act and the regulation passed under it, the Ontario Building Code. The Act and its Code prescribe standards for the construction and demolition of buildings. Among these standards are those that govern "the manner of construction and types and quality of material used" (s. 34(1)(3)); "the design of buildings and the use to which they may be put" (s. 34(1)(5)); and the "conditions under which the use of material, systems and building designs that are not authorized in the code may be allowed under section 9" of the Act (s. 34(1)(6)). Section 9 is an equivalency provision permitting the chief building official of a municipality to approve these materials, systems and building designs if they "will provide the level of performance required by the building code".

[para20] Section 8 of the Act prohibits any person from constructing or demolishing a building without a building permit. And a municipal building official cannot issue a permit for any construction or demolition that contravenes the Act or the Ontario Building Code, or "any other applicable law", such as planning or zoning by-laws.

[para21] Municipalities and their building inspectors have wide powers under the Act to enforce compliance with the statute and the Ontario Building Code. Mississauga has supplemented this statutory and regulatory regime by passing a building (permits) by-law establishing classes of permits, and the procedures and fees for obtaining a permit.

[para22] The Development Charges Act authorizes municipalities to pass by-laws that would impose development charges against land whose development would increase the need for municipal services. A development charge is defined in the statute as "a charge imposed with respect to growth-related net capital costs against land" and thus is a form of tax on land. Under the Act, Mississauga Council passed by-law 532/91, which establishes development charges in the City of Mississauga.

[para23] Importantly, under s. 9(1) of the statute a development charge is payable on the date a building permit is issued, and under s. 9(2), a municipality is not required to issue a building permit unless the development charge has been paid. Therefore, if the GTAA and Nav Canada are required to comply with the Building Code Act and the Ontario Building

Code, to obtain building permits for the redevelopment of Pearson Airport, they must first pay the development charges imposed by Mississauga.

[para24] In these reasons, I refer to the Building Code Act, the Ontario Building Code and Mississauga's building permits and development charges by-laws, collectively, as the Ontario building code regime.

2. The Federal Regime

[para25] The Government of Canada has its own regime for the design and construction of airports. Under the Aeronautics Act, R.S.C. 1985, c. A-2, the Minister of Transport is responsible for constructing, maintaining and operating "aerodromes", or airports. Because federal employees work in airports, regulations under the Canada Labour Code require their design and construction to meet the standards in the National Building Code and the National Fire Code. As I will discuss, under the Ground Lease between the Government of Canada and the GTAA, these national codes apply to the construction of new buildings at Pearson Airport unless the GTAA and Mississauga can conclude an agreement on the applicability of the Ontario Building Code. So far, they have failed to do so.

[para26] In constructing the new air traffic control tower at Pearson Airport, Nav Canada must also comply with these national codes, as well as with Transport Canada's control tower site and design standards, and with a variety of other federal and international standards for a civil air navigation system.

[para27] This then is the legislative and regulatory framework for the constitutional issues raised in this litigation.

D. The Litigation

[para28] MacPherson J. heard three applications together, two brought by the GTAA and one brought by Mississauga. The GTAA's applications and Mississauga's application mirror each other. In one of its applications, the GTAA sought a declaration that Ontario's building code regime, which includes the development charges levied by Mississauga, does not apply to it or to Pearson Airport. In the other, the GTAA appealed decisions by a Mississauga building inspector that ordered compliance with the Ontario building code regime in the demolition of the administration building and the construction of a new fire hall at the airport.

[para29] In its application, Mississauga sought various heads of declaratory relief against the GTAA and Nav Canada for their refusal to comply with the Ontario building code regime and to pay development charges. MacPherson J. allowed both applications brought by the GTAA and dismissed the application brought by Mississauga. I have concluded that MacPherson J. was correct in his disposition of all three applications.

E. The Issues

1. Did the applications judge err in holding that Ontario's building code regime does not apply to the redevelopment of Pearson Airport because it would intrude into Parliament's exclusive jurisdiction over aeronautics?

[para30] The central question on this appeal is whether the Building Code Act should be read down not to apply to the redevelopment of Pearson Airport because that redevelopment lies within Parliament's exclusive jurisdiction over aeronautics or a federal undertaking, or because Pearson Airport is on property owned by the federal Crown. I will deal first with whether MacPherson J. erred in concluding that Ontario's building code regime would intrude into the exclusive federal legislative authority over aeronautics.

[para31] A long line of Supreme Court of Canada decisions has held that Parliament's general power to make laws for the peace, order and good government of Canada gives it exclusive legislative authority over aeronautics. See Re Regulation and Control of Aeronautics in Canada, [1932] A.C. 54 (P.C.); and Johannesson v. West St. Paul, [1952] 1 S.C.R. 292. As MacPherson J. observed at p. 27, aeronautics falls under the "national dimensions" component of the peace, order and good

government power.

[para32] Mississauga submits, however, that the Ontario Building Code applies to the redevelopment at Pearson Airport. It says that both Nav Canada and the GTAA must obtain building permits. Under the Ontario building code regime, to obtain these permits Nav Canada and the GTAA must first pay the development charges levied by the city.

[para33] Mississauga makes four arguments in support of its submission. First, it contends that the federal power over aeronautics is limited to "those matters which are required for the flight of the aircraft". Second, it maintains that even if the federal aeronautics power is not limited in this way, Ontario's building code regime would not impair or interfere with aeronautical operations at Pearson. Third, it argues that building codes differ from zoning by-laws, and therefore the case law holding that provincial planning and zoning legislation does not apply to airports has no relevance to this case. Mississauga's fourth and alternative argument is that some of the buildings to be constructed at Pearson Airport do not fall within the aeronautics power and that the applications judge therefore erred by not examining the buildings individually.

[para34] Mississauga's first argument addresses the scope of the federal power over aeronautics. Mississauga submits that aeronautics is limited to aerial navigation. It includes airside facilities but not groundside facilities. On this submission, federal jurisdiction over aeronautics includes runways, air traffic controls and taxiways, but not passenger terminal buildings, cargo facilities and parking lots. Even if Mississauga is correct, the new air traffic control tower built and operated by Nav Canada comes squarely within the federal aeronautics power. However, Mississauga is not correct.

[para35] The case law has rendered the distinction between airside and ground-side facilities argued for by Mississauga untenable. The Supreme Court of Canada has held that the federal jurisdiction over aeronautics includes much more than aerial navigation in the strict sense. It includes the construction of airport buildings and the operation of airports. Iacobucci J. concisely stated the scope of the federal aeronautics power in Air Canada v. Ontario (Liquor Control Board) (1997), 148 D.L.R. (4th) 193 at 212 (S.C.C.): "... the federal aeronautics jurisdiction encompasses not only the regulation of the operation of aircraft, but also the regulation of the operation of airports". I therefore agree with MacPherson J.'s conclusion on this point, at p. 28:

> However, it is clear that federal jurisdiction is not just celestial; it is also terrestrial. It extends to those things in the air and on the ground that are essential for "aerial navigation" or "air transportation" to take place.
>
> A long line of cases establishes that airports, or in the early cases "aerodromes", are integral to the subject matter of aeronautics. Johannesson itself dealt with the location of an aerodrome in Manitoba.

[para36] Thus, the entire redevelopment of Pearson airport - not just the airside development project, but also the terminal development project, the infield development project and the utilities and airport support project - comes under the aeronautics power.

[para37] Mississauga's second argument is that the Ontario building code regime still applies because that regime does not impair or interfere with the redevelopment of Pearson Airport. This argument goes to the heart of this appeal because it raises the application of the interjurisdictional immunity principle in Canadian constitutional law.

[para38] The Building Code Act is valid provincial legislation under s. 92(13) of the Constitution Act 1867, which gives each provincial legislature exclusive jurisdiction to make laws in relation to "property and civil rights in the province". The Ontario Building Code has been validly passed under the Building Code Act. Normally, a valid provincial law of general application, such as the Building Code Act, may validly affect a federal matter. But the courts have carved out an important exception to this general rule. This exception is the interjurisdictional immunity principle, or as Beetz J. termed it in Bell Canada v. Québec (Commission de la Santé et de la

Sécurité du Travail), [1988] 1 S.C.R. 749 at 859, "the inapplicability of provincial legislation rule". See also P.W. Hogg, Constitutional Law of Canada, Loose-leaf ed. (Toronto: Carswell) Vol. 1 at pp. 15-25 to 15-33; Ordon Estate v. Grail, [1998] 3 S.C.R. 437.

[para39] The interjurisdictional immunity principle holds that "a basic minimum and unassailable content" must be assigned to each head of federal legislative power. Because federal legislative power is exclusive, provincial laws cannot affect that essential core. A provincial law, valid in most of its applications, must be read down not to apply to the core of the exclusive federal power. The application of this principle differs from the paramountcy doctrine in that it does not require conflicting or inconsistent federal legislation, or even the existence of federal legislation.

[para40] The interjurisdictional immunity principle has its roots in a Privy Council case decided a century ago: Canadian Pacific Railway v. Corporation of the Parish of Notre Dame de Bonsecours, [1899] A.C. 367 (P.C.). In that case, the Privy Council held that the Province of Québec could not regulate the construction of a ditch alongside a federal railway because Parliament had the "exclusive right to prescribe regulations for the construction, repair and alteration of the railway and for its management". Bonsecours has never been doubted and has been approved of many times by the Supreme Court of Canada, most recently in Ontario v. Canadian Pacific Railway Ltd., [1995] 2 S.C.R. 1028.

[para41] What then is the test for interjurisdictional immunity? Mississauga says that the test is whether the provincial legislation impairs or interferes with a federally regulated enterprise or undertaking, and it points out that the applications judge made no finding of impairment or interference. But that is the wrong test. The Supreme Court of Canada no longer uses the language of "impairs" or "interferes" or "paralyzes" or "sterilizes". Instead, the Supreme Court has posited a much broader test of immunity or exclusivity. If a provincial law affects a vital or essential or integral part of a federally regulated enterprise, then the otherwise valid provincial law does not apply to that enterprise. The Supreme Court of Canada approved of this broader test of interjurisdictional immunity in the Québec Minimum Wage case, Québec (Commission du Salaire Minimum) v. Bell Telephone Co. of Canada, [1966] S.C.R. 767. Because Bell was an inter-provincial undertaking and the provincial minimum wage law would affect a vital part of its operation, the Court held that the law did not apply. Writing for the Court, Martland J. said at p. 774:

> On the other hand, a statute which deals with a matter which, apart from regulatory legislation, would have been the subject matter of contract between employer and employee, e.g., rates of pay or hours of work, affects a vital part of the management and operation of the undertaking to which it relates. This being so, if such regulation relates to an undertaking which is within s. 92(10) (a), (b) or (c), in my opinion it can only be enacted by the federal parliament.

[para42] In a trilogy of cases in 1988, the Supreme Court reaffirmed that whether a provincial law affects a vital part of a federal enterprise is the test for interjurisdictional immunity: Alltrans Express Ltd. v. British Columbia (Workers' Compensation Board), [1988] 1 S.C.R. 897; Canadian National Railway Co. v. Courtois, [1988] 1 S.C.R. 868; and Bell Canada v. Québec (CSST), supra. In Bell Canada (1988), the Court held that an order made under provincial health and safety legislation assigning a pregnant worker away from a video display terminal could not apply to a federal undertaking. Although an order concerning a single employee could hardly "impair" Bell Canada's operations, the Supreme Court said that impairment was not required. The provincial law could not apply because by depriving Bell Canada of part of its workforce, the law affected a vital or essential part of Bell Canada's undertaking. Beetz J. made this clear at pp. 856-57:

> Appellants and the Attorney General of Quebec argued in the case at bar that the re-assignment of a pregnant worker would not impair the undertaking, especially as the pregnant worker would eventually have to leave her work in any case, at least temporarily. I am quite prepared to admit that the exercise of this right by a pregnant worker would not go so far as to impair or paralyze the undertaking. However, given that it

> deprives the undertaking of part of its work force in the long distance communication sector requiring the aid of an operator, I would not be ready to concede that such a right of re-assignment does not by its very nature affect a vital or essential part of the Bell Canada undertaking.

[para43] Beetz J. did discuss how a provincial law could "impair the operations and functioning of federal undertakings" because, as he put it "if the application of a provincial statute to a federal undertaking has the effect of impairing or paralyzing it, that a fortiori is an almost certain sign that such application bears upon the specifically federal nature of the undertaking and constitutes an encroachment on the exclusive legislative authority of Parliament". Nevertheless, to find that a provincial law does not apply to a federal undertaking "it is sufficient that the provincial statute ... affects a vital or essential part of that undertaking, without necessarily going as far as impairing or paralyzing it" (at pp. 859-60).

[para44] The Supreme Court of Canada has qualified this broad test in one important way and that qualification does require impairment. The qualification does not, however, apply in this case. In Attorney General of Québec v. Irwin Toy Ltd., [1989] 1 S.C.R. 927, the Supreme Court drew a distinction between the direct and indirect effect of a provincial law on a federal undertaking. If a province seeks to apply its law directly to a federal undertaking - the usual case - the provincial law will not apply if it affects a vital part of that undertaking. If, however, a provincial law only indirectly or incidentally affects a federal undertaking, it will apply unless it impairs, paralyzes or sterilizes the undertaking.

[para45] Thus, in Irwin Toy, the Supreme Court held that a Québec law prohibiting advertising directed at children could apply to television advertising even though television broadcasting is a federally-regulated undertaking and advertising is a vital part of the operation of that undertaking. The Supreme Court reasoned that because the prohibition on advertising did not apply directly to the broadcasters who were operating the federal undertaking - indeed, that it could not do - but only to advertisers in Québec, the effect on the federal undertaking was indirect or incidental. In Air Canada v. Ontario, supra, at p. 212, Iacobucci J. summarized this qualification: "The federal power to make laws touching on a vital part of a federal undertaking is exclusive ... However, a provincial law that does not purport to control an undertaking directly will be invalid only if it impairs, sterilizes or paralyzes that undertaking".

[para46] The qualification discussed in Irwin Toy does not apply in this case. Here, Ontario's building code regime would not merely affect Pearson Airport indirectly or incidentally. Mississauga is attempting to control an aeronautics undertaking directly by applying the Ontario building code regime to the redevelopment of the airport.

[para47] Thus, Mississauga's first submission turns on whether Ontario's building code regime would affect a vital part of the redevelopment at Pearson Airport. In my view, it undeniably would, and for that reason the Ontario regime is constitutionally inapplicable to the redevelopment.

[para48] Provincial or municipal laws that seek to regulate the physical structure of airports and airport buildings will affect a vital or integral part of an aeronautics undertaking. The Supreme Court of Canada emphasized this point in Construction Montcalm Inc. v. The Minimum Wage Commission, [1979] 1 S.C.R. 754, a case heavily relied on by MacPherson J. In Construction Montcalm, the majority of the court held that Québec's Minimum Wage Act applied to the employees of a private company, which was building the runways at Mirabel Airport under a contract with the federal Crown. Writing for the majority, Beetz J. held that although provincial laws that concern "the mode or manner of carrying out decisions in the act of constructing the airport" can apply to airports, those that concern whether and where to build an airport, its design, its dimensions and the material to be used in its buildings cannot (at p. 771). Beetz J. wrote at pp. 770-71:

> The construction of an airport is not in every respect an integral part of aeronautics. Much depends on what is meant by the word "construction". To decide whether to

> build an airport and where to build it involves aspects of airport construction which undoubtedly constitute matters of exclusive federal concern: the Johannesson case. This is why decisions of this type are not subject to municipal regulation or permission: the Johannesson case; City of Toronto v. Bell Telephone Co., [[1905] A.C. 52]; the result in Ottawa v. Shore and Horwitz Construction Co. [(1960), 22 D.L.R. (2d) 247] can also be justified on this ground. Similarly, the design of a future airport, its dimensions, the materials to be incorporated into the various buildings, runways and structures, and other similar specifications are, from a legislative point of view and apart from contract, matters of exclusive federal concern. The reason is that decisions made on these subjects will be permanently reflected in the structure of the finished product and are such as to have a direct effect upon its operational qualities, and therefore, upon its suitability for the purposes of aeronautics.

[para49] The Building Code Act and the Ontario Building Code prescribe the design of buildings, the manner of their construction, the types and quality of materials to be used and when buildings may be altered or demolished. According to Construction Montcalm, these are the very matters, that for an aeronautics undertaking, lie within Parliament's exclusive jurisdiction and are immune from provincial regulation. As Beetz J. said, decisions on these matters "will be permanently reflected in the structure of the finished product" and will "have a direct effect upon its operational qualities, and, therefore, upon its suitability for the purpose of aeronautics" (at p. 771).

[para50] If, as Bonsecours held, a province cannot regulate the construction of a ditch alongside a federal railway because to do so would affect a vital part of a railway undertaking, then a municipality cannot regulate the physical construction of airport buildings because to do so would affect a vital part of an aeronautics undertaking. Thus, MacPherson J. correctly concluded at p. 33 that "the actual physical structure of buildings of an airport is part of the protected federal subject matter of aeronautics."

[para51] Mississauga's third argument tries to distinguish building code legislation from planning and zoning legislation. A long line of cases, including several decision of this court, has held uniformly that provincial and municipal planning and zoning legislation does not apply to airports. See Johannesson v. West St. Paul, supra; Re Orangeville Airport Ltd. v. Town of Caledon (1976), 11 O.R. (2d) 546 (C.A.); Re Walker v. Ontario (Minister of Housing) (1983), 41 O.R. (2d) 9 (C.A.); Venchiarutti v. Longhurst (1992), 8 O.R. (3d) 422 (C.A.). Mississauga argues that the Building Code Act differs from planning and zoning legislation because its subject matter is the safety of buildings, not land or property development. MacPherson J. rejected this argument and so do I. As he said at p. 21: "... the subject matter of the Act is buildings and the land on which they are placed".

[para52] The recent Home Builders' case in the Supreme Court of Canada confirms that the subject matter of the Building Code Act and the Development Charges Act is land development: Ontario Home Builders' Association v. York Region Board of Education, [1996] 2 S.C.R. 929. Iacobucci J. wrote at p. 966 that the Planning Act, including the scheme of education development charges imposed under the Development Charges Act, "is one component of a comprehensive regulatory scheme governing land development in Ontario, comprised of at least nine difference statutes". One of those statutes is the Building Code Act. Therefore, the Building Code Act and the Development Charges Act stand on the same constitutional footing as provincial planning and zoning legislation. None of this legislation applies to the construction of airport buildings.

[para53] If any confirmation of this proposition were needed, it comes from Construction Montcalm. In the passage quoted above, Beetz J. approved of an Ontario trial decision, Ottawa v. Shore and Horwitz Construction Co. (1960), 22 D.L.R. (2d) 247 (Ont. H.C.). In that case, Donnelly J. held that a construction company building barracks at Rockcliffe Airport in Ottawa was not required to obtain a municipal building permit because the barracks were to be built on federal Crown land. In Construction Montcalm, Beetz J. commented that the result in Horwitz Construction was also justified on the

ground that the building of barracks "involves aspects of airport construction which undoubtedly constitute matters of exclusive federal concern ... not subject to municipal regulation or permission" (at p. 770). In short, requiring a municipal building permit for the construction of an airport building affects a vital or integral part of an aeronautics undertaking.

[para54] Mississauga's last and alternative argument is that not all of the new buildings at Pearson Airport are integral to an aeronautics undertaking; those buildings that are not are subject to Ontario's building code regime. Mississauga contends that MacPherson J. erred in not examining each building separately. This contention has no merit. MacPherson J. found that the entire redevelopment was required for the operation of a modern international airport. The new air traffic control tower - the "brains" of the civil air navigation system - is so obviously essential to the operation of Pearson Airport, that I have trouble understanding why Mississauga sued Nav Canada in this litigation. But the rest of the redevelopment project, including the new passenger terminal to replace Terminals 1 and 2, is also a vital or integral part of the operation of the airport. Indeed, Mississauga did not suggest one building in the redevelopment that was not essential for an international airport with the expected passenger and cargo volume of Pearson Airport.

[para55] Therefore, MacPherson J.'s finding that the entire redevelopment was essential for the operation of the airport and his refusal to embark on a building-by-building analysis of whether the Ontario building code regime applied were entirely reasonable and are entitled to deference in this court.

[para56] For all of these reasons, I conclude that MacPherson J. did not err in holding that "the application of Mississauga's building code regime to the demolition, alteration and construction of buildings in the redevelopment project at Pearson Airport would intrude into the exclusive federal jurisdiction over aeronautics" (at p. 36). This conclusion is sufficient to dispose of the constitutional question raised in this appeal. However, because MacPherson J. discussed the federal undertaking and Crown property issues and all the parties addressed them in this court, I will deal with them as well.

> 2. Did the applications judge err in holding that Ontario's building code regime does not apply to the redevelopment of Pearson Airport because it would intrude into Parliament's exclusive jurisdiction over a federal undertaking?

[para57] MacPherson J. concluded that Ontario's building code regime could not apply to the redevelopment of Pearson Airport for a second reason: it would intrude into Parliament's exclusive jurisdiction over federal works and undertakings. Mississauga submits that he erred in so concluding.

[para58] In Johannesson v. West St. Paul, the Supreme Court of Canada concluded that the peace, order and good government clause gives the federal government exclusive legislative authority over aeronautics. However, the federal government can also assert jurisdiction because of Parliament's exclusive legislative authority to make laws in relation to a federal work or undertaking under s. 92(10)(a) of the Constitution Act 1867. Section 92(10)(a) is the usual basis for Parliament's assertion of exclusive jurisdiction over our various modes of national transportation and communication. It provides:

> 92. In each Province the Legislature may exclusively ...
>
> 10. Local Works and Undertakings other than such as are of the following Classes:-
>
> > (a) Lines of Steam or other Ships, Railways, Canals, Telegraphs, and other Works and Undertakings connecting the Province with any other or others of the Provinces, or extending beyond the Limits of the Province. ...

[para59] In Construction Montcalm, Beetz J. at p. 770 observed that Mirabel Airport formed part of a federal undertaking:

> The issue was also discussed as if the Mirabel airport were a federal work or undertaking, and it could indeed be argued that an international airport is a work which forms part of an undertaking connecting a province with a foreign country or extending beyond the limits of a province.

[para60] Unquestionably, Pearson Airport, which is an international airport, also forms part of a federal work or undertaking under s. 92(10)(a). It matters not that the airport is located in one province: its air navigation system is integrated with facilities, services and staff across Canada and internationally. The airport plays a crucial role in Canada's national aviation system. Indeed, if it were removed from our national aviation system, air travel both within Canada and to and from other countries would be fundamentally altered. See Alberta Government Telephones v. C.R.T.C. (1989), 61 D.L.R. (4th) 193 (S.C.C.). Pearson Airport, including its air navigation system and air traffic control tower therefore forms part of "a work or undertaking connecting the province with any other province or extending beyond the limits of the province" under s. 92(10)(a).

[para61] It makes no difference whether Parliament's exclusive jurisdiction over airports and airport buildings lies under its power to make laws for the peace, order and good government of Canada, or under its power over federal undertakings. The principles governing the applicability of Ontario's building code regime are the same. The regime does not apply because it would affect a vital or integral part of a federal enterprise. Therefore, I agree with MacPherson J.'s conclusion at p. 37:

> My conclusion is, therefore, the same as it was on the aeronautics issue. The application of Mississauga's building code regime to the demolition, alteration and construction of buildings in the redevelopment project at Pearson Airport would intrude into exclusive federal jurisdiction over federal works and undertakings.

> 3. Did the applications judge err in holding that Ontario's building code regime does not apply to the redevelopment of Pearson Airport because it would intrude into Parliament's exclusive jurisdiction over federal Crown property?

[para62] Section 91(1A) of the Constitution Act 1867 gives Parliament exclusive legislative authority over the public debt and property. The federal Crown owns all the land at Pearson Airport. Therefore, MacPherson J. concluded at p. 27 that "the application of Mississauga's building code regime to the demolition, alteration and construction of buildings at Pearson Airport would intrude into exclusive federal jurisdiction over federal public property."

[para63] I agree with this conclusion. The governing principle is that s. 91(1A) is a subject matter limitation on provincial legislative power. As Beetz J. said in Construction Montcalm at p. 777:

> The enumeration of exclusive federal powers in s. 91 of the Constitution, including the power to make law in relation to the public debt and property, operates as a limitation ratione materiae upon provincial jurisdiction, not as a territorial limitation.

Provincial laws, such as building code statutes, whose very subject matter is land or property development, cannot apply to federal Crown property. Constitutionally, a municipality cannot require that buildings constructed on federal property, such as Pearson Airport, be built to municipal standards.

[para64] Mississauga put forward four arguments why the Building Code Act - and therefore the City's development charges by-law - applies to the redevelopment of Pearson Airport. First, land leased from the federal Crown is no longer federal public property; second, the Ground Lease between the Government of Canada and the GTAA deems the new buildings at Pearson Airport to be the property of the GTAA; third, the GTAA and Nav Canada are not a federal enclave immune from provincial laws; and fourth, Ontario's building code regime can apply because it will not "sterilize or affect a Crown real property interest". I will deal briefly with each of these arguments.

[para65] Under the Ground Lease between the federal Crown

and the GTAA, the GTAA has leased the land at Pearson Airport for sixty years. Similarly, under the Pearson Control Tower Lease, Nav Canada has leased the land for the control tower for sixty years. Mississauga submits that land leased from the federal Crown is no longer federal public property under s. 91(1A). This submission clashes with both principle and authority.

[para66] Property under s. 91(1A) means property in its broadest sense. It includes partial interests such as the federal Crown's reversionary interest in the land at Pearson Airport. Federal property ceases to be within the exclusive jurisdiction of Parliament under s. 91(1A) only when it is transferred to another person by the conveyance of a fee simple. This has not happened here. See G.V. LaForest, Natural Resources and Public Property under the Canadian Constitution (1969), pp. 134-35. In this case, the federal Crown still holds title to the land. It has a continuing property interest in the land. Mississauga seeks to prescribe standards for the construction of new buildings on this land. Its inspectors have the power to order the alteration or even demolition of a building. Thus, the federal Crown's property interest is necessarily affected by Ontario's building code regime.

[para67] The decision of the Supreme Court of Canada in Spooner Oils Ltd. v. Turner Valley Gas Conservation Board, [1933] S.C.R. 629 stands directly against Mississauga's position. Spooner Oils holds that provincial legislation cannot restrict the rights of lessees of federal property, any more than if the federal Crown itself occupied the property. In that case, Spooner Oils leased land in Alberta from the Government of Canada under a lease that gave it the right to mine petroleum and natural gas. In 1932, Alberta passed a statute that subjected Spooner Oils' operations to the control of a provincial board, whose duty was to limit the production of natural gas from the land. The Supreme Court of Canada relied on s. 91(1A) to hold that the provincial statute could not apply to the lessee Spooner Oils. Duff C.J. wrote that it mattered not "that, by the lease, an interest in the tract has passed to the lessee" (at p. 643). The provincial legislation still encroached on the exclusive jurisdiction of Parliament under s. 91(1A):

> Nor is it material that, by the lease, an interest in the tract has passed to the lessee. The Dominion Lands Act, and the Regulations enacted pursuant to it, give statutory effect to plans for dealing with Dominion public lands, including lands containing petroleum and natural gas, which, it must be assumed, were conceived by Parliament, and the authorities nominated by Parliament, as calculated to serve the general interest in the development and exploitation of such lands and the minerals in them. It is not competent to a provincial legislature pro tanto to nullify the regulations, to which Parliament has given the force of law in execution of such plans, by limiting and restricting the exercise of the rights in the public lands, created by such regulations in carrying the purpose of Parliament into effect. Indeed, an administrative order, which the legislature has professed to endow with the force of statute, directed against a tract of public land, the property of the Dominion, held by a lessee under the Regulations of 1910 and 1911, and which professed to regulate the exercise, by the lessee, of his right to take gas and petroleum from the demised lands, would truly be an attempt to legislate in relation to a subject reserved for the exclusive legislative jurisdiction of the Dominion by s. 91 (1), "The Public * * * Property" of the Dominion (at pp. 643-44).

[para68] Admittedly, the provincial legislation in question in Spooner Oils was aimed at the lessee, while the Building Code Act is not aimed at the GTAA or Nav Canada, but is a provincial law of general application. However, this distinction makes no constitutional difference. In both cases, the provincial law would affect and thus cannot apply to federal property.

[para69] Many cases, including several dealing with airport buildings located on federal property, have applied the principle in Spooner Oils. Almost without exception, these cases have held that provincial and municipal land use and property development laws do not apply to federal property, whether the Crown has leased the property or not. Whether the building is to be erected by a private contractor

or by a lessee, a municipal building permit is not required. See City of Ottawa v. Shore and Horwitz Construction Co. Ltd., supra; Delta v. Aztec Aviation Group (1985), 28 M.P.L.R. 215 (B.C.S.C.); International Aviation Terminals v. Township of Richmond (1992), 89 D.L.R. (4th) 1 (B.C.C.A.).

[para70] In support of its submission that Ontario's building code regime should apply to Pearson Airport, Mississauga relies on the case law under s. 125 of the Constitution Act 1867. Section 125 states that "No lands or property belonging to Canada or any province shall be liable to taxation". This section confers immunity from a tax charged on Crown property or on the Crown itself in respect of its property but not on private persons who have some interest in Crown land. Thus, the case law has held that s. 125 does not prevent the province from taxing a lessee of federal property or the lessee's leasehold interest.

[para71] This case law does not assist Mississauga. In determining whether provincial tax legislation offends s. 125, the overriding question is whether the legislation affects the federal Crown's property interest. If the province taxes only the lessee's interest and not the federal Crown's interest, then the federal property interest is likely not affected and the provincial law will not offend s. 125. See B. Laskin, Canadian Constitutional Law (3rd rev. ed.) (Toronto, Carswell, 1969), pp. 767-68. By contrast, s. 91(1A) does apply to leased federal Crown land. The Crown has a continuing property interest in the leased land, which would be affected by provincial property development legislation.

[para72] Mississauga's second reason why Ontario's building code regime applies is that the Ground Lease deems any new building at Pearson Airport to be the GTAA's property during the term of the lease. Section 3.10.01(a) of the Ground Lease sets out this deeming provision:

> 3.10.01 The Landlord and the Tenant agree that
>
> (a) any New Facility and any addition to, improvement to, alteration of or replacement of any Existing Facility which may be constructed upon the Lands from time to time are and shall be fixtures to the Lands and are intended to be and shall become the absolute property of the Landlord upon the expiry or early termination of this Lease without any payment being made therefor, free and clear of all mortgages, charges and encumbrances, but shall be deemed, as between the Landlord and the Tenant to be the separate property of the Tenant and not of the Landlord, during this Lease.

[para73] The deeming provision between the landlord (the federal Crown) and the tenant (the GTAA) affects certain rights of the parties between themselves. However, this provision cannot affect the rights of third parties; nor, more importantly, can it affect the legal status of new buildings as federal property for constitutional purposes. Buildings constructed on leased land become part of the property of the landlord leased to the tenant. The parties cannot by agreement change this result by law, this result occurs automatically. See Anger and Honsberger, Law of Real Property, (2d ed.) (1985) Vol. 2 at pp. 1011-12; and Melluish (Inspector of Taxes) v. B.M.I. (No. 3) Ltd., [1996] 1 A.C. 454 (H.L.).

[para74] Moreover, several provisions of the Ground Lease confirm that the GTAA has only a leasehold interest in new buildings at Pearson Airport. For example, s. 3.01.01 provides that "... the Landlord hereby leases to the Tenant the Demised Premises ...". "Demised Premises" is defined in s. 1.01.01 of the Ground Lease to include "collectively the Lands, any Existing Facility, any New Facility, any other building, improvement or structure now or hereafter located on the Lands ...". The federal Crown has simply leased Pearson Airport to the GTAA. The lease includes any new buildings constructed during the lease term. Thus the deeming provision in s. 3.10.01(a) of the Ground Lease does not support Mississauga's position.

[para75] The terms of the Ground Lease provide an additional reason why Ontario's building code regime does not apply to Pearson Airport. Section 14.02(e) of the Ground Lease obligates the GTAA to negotiate in good faith a Municipal-Authority Agreement with Mississauga covering "such agreed upon provincial and municipal construction and other

codes, regulations and by-laws of general application ...". Failing agreement, however, under s. 14.03.04 of the Ground Lease, any new facilities constructed or any existing facilities altered at Pearson Airport must comply with the National Building Code and the National Fire Code. Under s. 14.03.10, the GTAA must obtain an independent architect or engineer to certify that all construction substantially accords with these national codes. The GTAA has not concluded an agreement with Mississauga. Therefore, the national codes and the independent review by an architect or engineer, not the provincial building code regime, govern construction of the new airport buildings.

[para76] In Spooner Oils, the Supreme Court said that if a provision of a lease from the federal Crown conflicts with provincial legislation, the provision in the federal Crown's lease prevails. Here, a conflict does exist between the Ground Lease and the Building Code Act. Even if the equivalency provision in s. 9 of the Ontario statute could eliminate any conflict between Ontario's Building Code and the national codes, the enforcement regimes conflict. Enforcement under Ontario's Building Code Act and Building Code is inconsistent with the independent review mechanism in s. 14.03.10 of the Ground Lease.

[para77] Mississauga's third argument is that the GTAA and Nav Canada are not a federal enclave immune from provincial legislation. This proposition is undeniably correct. The majority decision in Construction Montcalm demonstrates that some provincial laws apply on federal property. In that case, provincial labour legislation was held to apply to employees of a private company doing construction work on federal property under a contract with the federal Crown. However, the provincial legislation did not affect the Crown's property rights. Here, Ontario's building code regime does affect the Crown's property rights at Pearson Airport. The provincial regime seeks to regulate the very use and development of the property. For this reason, it invades Parliament's exclusive jurisdiction under s. 91(1A). See D. Gibson, The Federal Enclave Fallacy in Canadian Constitutional Law (1976) 14 Alta. L.R. 167 at 173.

[para78] Mississauga's fourth argument is that the Ontario building code regime applies to the redevelopment because it does not "sterilize or affect a Crown real property interest". This argument has no merit. As I have already said, the federal Crown has a continuing property interest in Pearson Airport, which would be directly affected by Ontario's building code regime. Again, Spooner Oils is binding authority against Mississauga's argument.

[para79] For these reasons, I would not give effect to this ground of appeal.

4. Did the applications judge err in holding that Mississauga had no standing to claim that the GTAA was not entitled to apply the National Building Code under s. 14.03 of the Ground Lease between the federal Crown and the GTAA?

[para80] As I discussed earlier, s. 14.02 of the Ground Lease obligates the GTAA to negotiate in good faith a Municipal-Authority Agreement with Mississauga. Such an agreement could provide for the application of the Ontario Building Code. But if Mississauga and the GTAA cannot reach an agreement, then under s. 14.03.04 of the Ground Lease the National Building Code and the National Fire Code apply to construction at Pearson Airport.

[para81] Because the GTAA has not concluded an Municipal-Authority Agreement with Mississauga, it has relied on the national codes. Mississauga contends that the GTAA is not entitled to do so because it has breached its obligation to negotiate in good faith. Whether the GTAA has negotiated in good faith is disputed. The GTAA says it has. So too does the federal Crown. Mississauga says it has not. However, the Ground Lease is a contract between the federal Crown and the GTAA. Mississauga is not a party to it. MacPherson J. therefore held that Mississauga did not have standing to claim that the GTAA had breached its covenant to negotiate in good faith. I agree with him.

[para82] The ordinary rule is that a stranger to a contract cannot claim a right under that contract. This privity rule has exceptions but Mississauga has not relied on any of them. I can do no better than quote the words of

MacPherson J. at p. 40:

> There are exceptions to the privity doctrine. A contract may confer enforceable rights upon a third party in three situations - where a party to a contract has acted as an agent for the stranger in acquiring the contractual rights, where a party to the contract has constituted himself trustee of the contractual rights for the benefit of the stranger, and where employees of a party to the contract were clearly intended to receive the benefit of an exclusion of liability relating to their employer in circumstances where the employees were acting in the course of their duties for that employer on matters under the contract: see Greenwood Shopping Plaza [Ltd. v. Beattie, [1980] 2 S.C.R. 228, 111 D.L.R. (3d) 257] and London Drugs Ltd. v. Kuehne & Nagel International Ltd., [1992] 3 S.C.R. 299, 97 D.L.R. (4th) 261. Mississauga does not attempt to bring itself within any of these exceptions.

[para83] I would not give effect to this ground of appeal.

> 5. Did the applications judge err in refusing to grant a declaration that Mississauga is entitled to "fair, reasonable and equitable compensation" for its capital costs connected with the redevelopment of Pearson Airport?

[para84] Mississauga advanced an alternative argument for the recovery of the capital costs it claims to have incurred in providing municipal services to Pearson Airport. If it cannot recover development charges under its by-law, it contends that it is entitled to recover its capital costs at common law. It seeks a declaration that it is entitled to "fair, reasonable and equitable compensation" for the capital costs associated with the redevelopment of Pearson Airport.

[para85] MacPherson J. refused this declaration for two reasons. He found no common law obligation to pay; and he held that Mississauga had another remedy, an application for a grant in lieu of taxes ("GILT") under the federal Municipal Grants Act, R.S.C. 1985 c. M-13. I agree with both of his reasons for refusing Mississauga declaratory relief.

[para86] The common law obligation to pay fair compensation for services provided has its roots in Dominion of Canada v. City of Levis, [1919] A.C. 505 (P.C.). In that case, the Privy Council held that though a federal government building could not be taxed by a municipality, the federal government was nonetheless required to pay a "fair and reasonable price" for water supplied to the building by the City Council (at p. 510). Recently, the British Columbia Court of Appeal applied Levis to impose a common law duty on municipalities to supply available, essential public services to two Indian bands in exchange for a reasonable fee: Tsawassen Indian Band v. Corporation of Delta (1997), 149 D.L.R. (4th) 672.

[para87] The obligation imposed on the Crown in Levis to pay a fair and reasonable fee applies to "merchantable commodities" such as water, or to services. MacPherson J. found as a fact that as customers of Mississauga the GTAA and Nav Canada "have paid, and will continue to pay, for any commodities or services they purchase" (at p. 38). In this case, however, Mississauga wants to extend Levis by imposing an obligation on the federal Crown to pay the capital costs of providing municipal services. In substance, it seeks an amount for capital costs equivalent to the development charges it has levied on the GTAA and Nav Canada.

[para88] The principle underlying Levis does not apply to this kind of charge. A development charge is a form of tax or a regulatory charge on land development. It is not a payment for specific services or for merchantable commodities. Indeed, this court has held that a development charge is not even collected to defray the capital costs attributable to a particular development. A development charge bears no relationship to the value to the developer of the capital expenditure it is intended to offset. I therefore see no justification for extending Levis to require payment of capital costs and, in effect, to permit Mississauga to recover its development charges at common law. See Ontario Home Builders' Association v. York Regional Board of Education, supra, at pp. 977-78; Ontario Cancer Treatment and Research Foundation v. Ottawa (City) (1998), 157 D.L.R. (4th) 38 (Ont. C.A.); Westbank First Nation v. British Columbia Hydro and

Power Authority (2000), 176 D.L.R. (4th) 276 (S.C.C.).

[para89] The second reason why the declaratory relief sought by Mississauga should be refused is that Mississauga has an alternative remedy under the Municipal Grants Act. The Government of Canada has recognized that where it is immune from provincial or municipal legislation, it may still benefit from provincial and municipal services, and therefore should bear its fair share of the cost of those services. Parliament's enactment of the Municipal Grants Act is a measure of cooperative federalism. Under s. 3(1) of the Act, Mississauga may apply to the Minister of Public Works and Government Services for a grant in lieu of a "real property tax" or a "frontage area tax in respect of federal property" within its boundaries. Pearson Airport is a federal property within Mississauga's boundaries. Real property taxes and frontage area taxes are defined in s. 2(1) of the statute to include any tax "in the nature of a development tax". Undoubtedly, a development tax includes development charges under the Development Charges Act. Thus, Mississauga can apply for a GILT to cover its development charges for the redevelopment of Pearson Airport.

[para90] Indeed, the federal statutory scheme contemplates GILT payments instead of development charges for Pearson Airport. Section 3(1)(l) of the Municipal Grants Regulations, 1980 S.O.R. 81-29, designates any real property owned by the federal Crown and leased to a "designated airport authority", such as the GTAA, to be "federal property" for the purpose of the Municipal Grants Act. Further, s. 5.04.01(a) of the Ground Lease requires the GTAA to make payments to the federal government to allow the government to make grants in lieu of "real property taxes" to municipalities. Real property taxes are defined in s. 5.01.01 of the Ground Lease to include "all taxes ... and development charges, whether general or special, ordinary or extraordinary, foreseen or unforeseen, of every nature or kind whatsoever ...". Obviously, GILT payments under the Municipal Grants Act were intended to replace the development charges Mississauga now seeks to extract.

[para91] Mississauga argues that GILT payments are discretionary. Therefore, it has no guarantee of receiving a grant, let alone the full amount of its development charges. These arguments ring hollow. Even as late as the oral argument before this court, Mississauga still had not applied for a GILT. At the very least, Mississauga must resort to the statutory regime that specifically addresses its claim before seeking discretionary relief from the court. I therefore see no merit in this ground of appeal.

> 6. Did the applications judge err in refusing to grant Mississauga a declaration that it is not required to provide fire and emergency services at Pearson Airport unless the GTAA and Nav Canada are required to pay the development charges levied by Mississauga?

[para92] The GTAA has designated Mississauga's fire and emergency service the primary response agency for fires and emergencies at Pearson Airport, and a support agency for fires and emergencies in airplanes. Mississauga submits that the GTAA can only claim the benefits of these services if it is willing to accept the burden of Ontario's building code regime, which includes the payment of development charges. Although the GTAA now pays for the operating costs of these services, Mississauga contends that the redevelopment of Pearson Airport will add to the capital costs of providing the services. These increased capital costs, Mississauga contends, should be borne by the GTAA and funded by the payment of development charges.

[para93] In making this submission, Mississauga relies on the benefit/burden exception to Crown immunity. This exception provides that where the Crown invokes the benefits of a law, it may also be subject to the burdens of that law. Thus, when the federal Crown seeks to benefit from provincial legislation, it may find itself subject to that legislation. See Sparling v. Québec, [1988] 2 S.C.R. 1015.

[para94] There are two answers to Mississauga's submission. First, I doubt that the benefit/burden exception applies in this case; and even if it does, Mississauga's claim does not come within it. The benefit/burden principle is an exception to the ordinary rule that the Crown is not bound by a statute unless the statute says so. See Interpretation Act, R.S.C. 1985, c. I-21, s. 17. By accepting the benefits of a statute, the Crown impliedly waives its statutory immunity.

But interjurisdictional immunity is not a statutory principle; it is a constitutional principle. It cannot be waived.

[para95] However, even if the benefit/burden exception does apply, Mississauga cannot bring itself within it. Mississauga provides fire services under the Fire Protection and Prevention Act, 1997, S.O. 1997 c. 4. Mississauga argues that the GTAA cannot accept the benefits of these fire services unless it incurs the burdens of the building code regime. But to invoke the benefit/burden exception, there must be a "... relationship or nexus between the benefit sought to be taken from a statutory or regulatory provision and the burdens attendant upon that benefit". See Sparling at pp. 1027-28. Although the benefit and the burden need not arise under the same statute, the "crucial question is whether the two elements are sufficiently related so that the benefit must have been intended to be conditional upon compliance with the restriction". See Sparling at p. 1025. Nothing in the Fire Protection and Prevention Act, 1997 suggests that the delivery of fire services was intended to be conditional on compliance with the Ontario building code regime. As MacPherson J. aptly observed in rejecting Mississauga's submission at p. 41:

> Does the Mississauga fire department refuse to attend fires at the homes of residents who have been slow about shovelling snow from their walkways in violation of a municipal by-law, or at a small corner grocery that is late paying its property taxes? Somehow I doubt it. And what happens in Mississauga now at a construction site where a Mississauga building inspector has found building code violations? If there is a fire, does the fire department refuse to attend? Again, I doubt it.

[para96] The second answer to Mississauga's submission comes back to the GILT provisions under the Municipal Grants Act. As MacPherson J. concluded, instead of trying to collect development charges, Mississauga must first apply for a GILT under that Act. Parliament enacted a statutory regime that is meant to ensure the federal Crown pays its fair share of the costs of provincial and municipal services from which it benefits, even though it may be immune from the authorizing provincial legislation. In my view, Mississauga must resort to this statutory regime. I would therefore refuse the declaration concerning fire and emergency services sought by Mississauga.

F. Conclusion

[para97] For these reasons, I would dismiss the appeal. I would order Mississauga to pay the GTAA and Nav Canada their costs of the appeal.

William R. Hunter, for the applicants.
Michael Johnston and Richard Knott, for the respondents.

[para1] PANET J.:-- This is an appeal pursuant to Section 25(1) of the Building Code Act S.O. 1992, c. 23, as amended, (the "Act") from the decision in which a Conditional Building Permit, dated November 3, 1998, was issued to Merrickville Community Health Centre (the "Health Centre").

[para2] As a preliminary matter, the Applicants brought a Motion for an Order granting leave to amend the Notice of Application in this matter to add the Chief Building Official, Randy E. Wilkinson, as a Respondent to this application and for an Order extending the time to bring an application against Mr. Wilkinson as prescribed by the Act. On the

consent of all parties, the two requested orders are hereby made.

[para3] The appeal relates to a Conditional Building Permit which was issued to the Health Centre on November 3, 1998 by the Chief Building Official of the Village of Merrickville-Wolford ("the Village") for the construction of a foundation and below grade services at the building site located on the fair grounds of the Village. The Health Centre is a corporation without share capital incorporated in the province of Ontario by Letters Patent dated August 27, 1974. The Health Centre currently owns and operates a building for the delivery of services in the health care field. For some time, it has been considered desirable to construct a new health care centre and in this regard funding was obtained to enable the construction of the new health care facility. It was desired to proceed as quickly as possible with the construction of the new facility. With this objective in mind, the Conditional Building Permit was issued on November 3, 1998.

[para4] The Applicants object to the issuance of the Conditional Building Permit on the basis that the zoning designation for the parcel of land on which the Health Centre proposes to erect the health care facility is "Open Space" and that zoning does not permit a medical centre. The Applicants also contend that the building site is located partially on a road allowance which has not been closed and for this reason also submit that the Conditional Building Permit should not have been issued. The Applicants submit that they are aggrieved by the decision to issue a Conditional Building Permit as they have been deprived of their right to oppose any re-zoning by-law before the Ontario Municipal Board.

[para5] The Respondents argue that the Conditional Building Permit was issued in compliance with Zoning By-law No. 23-94 of the Village in that it comes within the exception found in Section 3.24(i) of the Zoning By-law. The Respondents submit that the road allowance has in fact been closed pursuant to the order of Cosgrove J. dated December 15, 1998. The Respondents also argue that the Applicants have not been aggrieved because the construction of the new health care facility will be a significant benefit to all those persons living in the Village of Merrickville.

[para6] The issuance of a Conditional Building Permit is authorised under section 8(3) of the Act which provides in part as follows:

> "Even though all requirements have not been met to obtain a permit under subsection (2), the chief building official may issue a conditional permit for any stage of construction if,
>
> a) compliance with by-laws passed under sections 34 and 38 of the Planning Act and with such other applicable law as may be set out in the building code has been achieved in respect of the proposed building or construction;"

[para7] Section 34 (1) of the Planning Act provides for the passing of zoning by-laws by councils of local municipalities and Zoning By-law No. 23-94 of the Village was enacted in conformity with the Official Plan pursuant to section 34 of the Planning Act.

[para8] Section 6.6.1 of the Official Plan of the Village provides as follows:

> "No buildings or structures shall be permitted in the Open Space areas unless erected for purposes incidental and accessory to recreation uses or those erected for indoor recreational use such as community centres or arenas."

It is agreed between all parties that the parcel of land on which the Health Centre proposes to erect the health care facility is zoned as "Open Space". Zoning By-law No. 23-94 of the Village does not permit a medical centre or health care facility to be erected in the "Open Space" zone.

[para9] The first issue between the parties is whether the new facility comes within the exception to the provision related to zoning as "Open Space" as found in section 3.24(i). Because of this importance to this appeal, it is reproduced in full as follows:

> "Notwithstanding any other provisions of this By-law, the Corporation of the Village of Merrickville, Ontario Hydro, any local Board, any Commission, any telephone or telegraph company, any transportation system owned or operated by or for the Village of Merrickville, or any local board of the Corporation as defined by the Municipal Act and any Department or Ministry of the Federal or Provincial Government, may, for the purpose of public service, use any land, or erect any building or structure in any zone notwithstanding that such building or structure or proposed use does not conform to the provisions of this by-law for such zone."

[para10] The Respondents argue first that the land is owned by the Village and that it is the Corporation of the Village of Merrickville which is using the land or erecting the building. Because there is a lease agreement between the Village and the Health Centre which provides that the lands are to be used by the Health Centre "for the purpose of a non-profit publicly-funded community health centre under the direction of a volunteer board of directors" the Village contends that the construction of the health facility comes within the exception in section 3.24(i). However, the wording of this exception contemplates that the Village itself would use the land for the purpose of a public service or would erect a building or structure in that zone. Reading this exception as found in section 3.24(i), it appears that the intention is to allow for an exception to the zoning by-law where the Village itself is to use the land for the purpose of a public service and a reasonable interpretation of the by-law does not extend, in my view, to allow the Village to lease the land to third parties to accomplish the same purpose. The exception in this by-law enumerates a number of entities which are allowed to use this land for the purpose of public service. The types of entities have obviously been carefully considered and described in section 3.24(i). To conclude that the exception would extend to allow not only these entities, but any other person, firm or body to use these lands, by way of lease, from one of these enumerated bodies would in my view be an unreasonable interpretation of this by-law.

[para11] The Respondents also contend, in the alternative, that the Health Centre is an entity within the meaning of "any local Board" as found in section 3.24(i). The term "local board" is not defined in the Act however it is defined in section 1 of the Municipal Affairs Act, R.S.O. 1990, c. M.46, s. 1 as follows:

> "Local Board" means a school board, public utility commission, transportation commission, public library board, board of park management, board of health, police services board, planning board, or any other board, commission, committee, body or local authority established or exercising any power or authority under any general or special Act with respect to any of the affairs or purposes, of a municipality or of two or more municipalities or parts thereof."

[para12] The terms "Local Board" is also defined in section 1 of the Municipal Conflict of Interest Act, R.S.O. 1990, c. M.50. It would appear that a local board is intended to mean a body, commission or authority, in some sense a public authority, operating in the public interest and exercising some power with respect to any of the affairs or purposes of a municipality.

[para13] In the present case, the Health Centre does not operate under the authority of the municipality and does not operate with respect to the affairs or purposes of a municipality but rather its objects, as stated in its Letters Patent, relate to the establishment and maintenance of premises and facilities for the provision of health services in its broader sense. In a similar situation, it was argued in Friends of McNichol Park v. Burlington (1997) 31 O.R. (3d) 405 that a hospital was a "public authority". The court found in that case that even though a hospital has a "board" which is the board of directors of the hospital, this did not make the hospital itself a board within the meaning of the zoning by-law considered in that case. It was also concluded that a hospital is no more an establishment created by or for a provincial body any more than any private or public corporation incorporated under the relevant corporation legislation and concluded that a public hospital is not a public authority. I conclude therefore that neither the Health Centre nor the board of directors of the Health Centre

comes within the meaning of the words "any local Board" in section 3.24(i) of Zoning By-law of no. 23-94. For the same reasons, I find that it does come within the words "or any local board of the Corporation as defined in the Municipal Act". I would note that it was agreed by counsel for all parties that the reference in section 3.24(i) to the Municipal Act is actually to the "Municipal Affairs Act".

[para14] The next issue raised by the Applicants is that the building site is, in part, on a road allowance, designated as "Brock St.", and that road allowance has not been closed. As indicated, the position of the Respondents is that Brock St. has been closed by virtue of the Order of Cosgrove J. dated December 15, 1998. The Applicants state that this Order was obtained on an ex-parte basis without notice to the Applicants and the Applicants have filed a Notice of Appeal to the Divisional Court from this judgment. In my view, the relevant date for the determination as to whether the Conditional Building Permit was issued in compliance with by-laws and with other applicable law, as provided in section 8(3)(a) of the Act must be the date on which the permit itself was issued which in this case was November 3, 1998. As of that date, the road allowance was not closed and, as a result, as of that date the Conditional Building Permit was issued which allowed construction on a road allowance which was not closed.

[para15] In summary, I find that the Conditional Building Permit authorized construction of a "new medical, community health centre" on lands designated under Zoning By-law no. 23-94 as "Open Space" and that such construction would be in breach of that zoning by-law and further that such construction would take place, in part, on a road allowance which was not closed. Accordingly, the Conditional Building Permit was issued in breach of the requirements found in section 8(3)(a) of the Act.

[para16] A final question is whether the Applicants come within the provision in section 25(1) of the Act, as to parties who may appeal, which includes: "any person who considers themself aggrieved by an order or decision made by an inspector or chief building official under this Act". The Respondents argue that the Applicants have not been aggrieved in any way and rather, in the event that the construction of the Health Centre does not proceed, it is the residents of the Village and the surrounding district who will be deprived of essential services.

[para17] In this regard, it is established that a person need not have a personal, proprietary or pecuniary interest to be aggrieved by an act of the Chief Building Official (see Friends of Toronto Parkland, (1992) 6 O.R. (3d) 196).

[para18] In the present case, the Applicants argue they have a legitimate interest in preserving the lands designated as "Open Space" and, further, are aggrieved by the issuance of the building permit which is in breach of the zoning by-law because they are deprived of their right to oppose any re-zoning by-law before the Ontario Municipal Board. I have concluded that the issuance of the building permit was a violation of the zoning by-law. The objection by the Applicants is not in any way "a battle that had been fought and lost" as was the case in Friends of Toronto Parkland (supra) but rather a legitimate position that they have been deprived of their rights to object to the re-zoning before the Ontario Municipal Board. I conclude therefore that the Applicants are persons who consider themselves aggrieved and accordingly have status to bring this appeal under section 25(1) of the Building Code Act.

[para19] It therefore ordered that the Conditional Building Permit bearing Permit no. B60-98, issued on November 3, 1998, to the Merrickville Community Health Centre Inc. shall be rescinded.

[para20] I would allow costs to the Applicants on a party and party basis. If counsel cannot agree on costs written submission may be made to me within 30 days of this order.

PANET J.

Re **Ontario Cancer Treatment and Research Foundation and Ottawa** et al.

[Indexed as: Ontario Cancer Treatment & Research Foundation v. Ottawa (City)]

38 O.R. (3d) 224
[1998] O.J. No. 552
Docket No. C22850

Court of Appeal for Ontario
Finlayson, Osborne and Labrosse JJ.A.
February 12, 1998

APPEAL from an order of Binks J. (1996), 29 M.P.L.R. (2d) 112 (Gen. Div.), declaring that the Ontario Cancer Treatment and Research Foundation was exempt from payment of a development charge under the Development Charges Act, R.S.O. 1990, c. D.9.

Guy J. Pratte, for appellant, Hydro-Electric Commission of the City of Ottawa.
Charles T. Hackland and Wayne J. Brynaert, for respondent.

FINLAYSON J.A. (dissenting): -- This is an appeal by the Hydro-Electric Commission of the City of Ottawa ("Ottawa Hydro")
from the judgment of the Honourable Mr. Justice Binks of the Ontario Court (General Division). By that judgment, reported (1996), 29 M.P.L.R. (2d) 112, Binks J. granted to the Ontario Cancer Treatment and Research Foundation (the "Foundation") a declaration exempting it from the obligation to pay, in relation to a development at 501 Smyth Road in the City of Ottawa, the Ottawa Hydro portion of development charges in the amount of $174,056 exacted pursuant to the Development Charges Act, R.S.O. 1990, c. D.9 (the "Act"), and Ottawa's By-law 279-91 (the "Development Charges By-Law").

The development charge became payable upon the Foundation obtaining a building permit in the summer of 1993 for the expansion of a cancer treatment facility located at 501 Smyth Road, Ottawa. Neither the land nor the buildings located on the land are owned by the Foundation; rather, their registered owner is the Ottawa Health Sciences Centre Inc. The Foundation occupies the land as a tenant of the Health Sciences Centre.

On or about October 7, 1993, the Foundation and the City of Ottawa entered into a deferral agreement in relation to the development charge at issue. Pursuant to the terms of the agreement, the parties agreed that the development charge would not be payable until such time as its applicability to the Foundation (including the Ottawa Hydro component whose collection is the City's responsibility) had been lawfully determined.

Subsequently, the City of Ottawa provided to the Foundation a grant equivalent to the City's component of the development charge, thus avoiding the need for litigation. However, Ottawa Hydro decided to proceed with the contemplated litigation in respect of its separate and distinct component of the development charge.

Binks J. held that the development charge in question was, in essence, a tax and that the Foundation was exempted from the payment of the charge by reason of s. 16 of the Cancer Act, R.S.O. 1990, c. C.1, which provides, inter alia, that the Foundation is not subject to taxation in relation to its real and personal property.

The position of the appellant as set out in its factum is that:

(a) the Hydro component of the development charge is a regulatory charge, and not a tax;

(b) in any event, the Development Charges Act expressly overrides any tax exemption contained in the Cancer Act; and, in the further alternative,

(c) the Foundation, as tenant, cannot avail itself of the tax exemption provided in the Cancer Act.

Facts

Ottawa Hydro is a Hydro Electric Commission established under a by-law of the City of Ottawa in 1916. In accordance with the provisions of the then Public Utilities Act and the Power Commission Act, the City of Ottawa delegated to Ottawa Hydro all responsibility for the control and management of the construction, operation and maintenance of all works undertaken by the City for the distribution and supply of electrical power or energy.

Ontario Hydro is responsible for the generation and transmission of electricity to terminal stations jointly operated by Ottawa Hydro and Ontario Hydro. At this point, Ottawa Hydro purchases the electricity from Ontario Hydro at wholesale cost, and distributes it to local consumers of electricity.

Ottawa Hydro is responsible for establishing the rates (as opposed to "taxes", which Ottawa Hydro has no power to impose) charged to consumers for the supply of electricity and for making all decisions relating to expansions or improvements in its distribution network. The rates charged to its customers are Ottawa Hydro's primary source of revenue.

Prior to the enactment of the Development Charges By-Law, Ottawa Hydro prepared annual budgets based on its anticipated revenues and expenses, both operational and capital. With respect to the capital requirements related to its statutory obligation to supply its utility service, Ottawa Hydro was required to anticipate future land development and take the necessary steps to ensure that these areas were adequately serviced when they were ultimately developed. Thus Ottawa Hydro estimated the costs of the infrastructure required to service future developments and incorporated these costs into its annual budget.

Based on the data contained in its annual budget, and the province-wide rate-setting criteria established by Ontario Hydro, Ottawa Hydro calculated the rates it should charge to consumers of electricity in order to offset its expenses. Accordingly, that portion of Ottawa Hydro's incremental capital costs occasioned by new developments was, prior to the Development Charges By-Law in 1991, borne by all consumers of electricity in the form of a rate increase established by Ottawa Hydro.

The Foundation confirmed that it had always paid Ottawa Hydro's rates relating to its consumption of electricity which, prior to 1991, included the same type of capital costs now sought to be recovered through development charges.

While it remains within its power to defray growth-related capital costs by increasing the rates charged to all consumers, Ottawa Hydro's stated position is that it is more equitable to recover these costs, as nearly as possible, from those causing them to be incurred. Therefore, Ottawa Hydro elected to recover its growth-related capital costs by way of development charges, in lieu of assessing these costs against all of its consumers by way of general rate increases. The mechanism afforded by the Act was selected for this purpose.

Under the authority of the Act, the City of Ottawa enacted the Development Charges By-Law in 1991, which imposes a charge against land if the development of the land would increase the need for various services. The Development Charges By-Law distinguishes between two separate components of the development charge, the City of Ottawa component and the Ottawa Hydro component. The charges are set out as Schedules A and B respectively to the Development Charges By-Law.

The evidence before Binks J. was that Ottawa Hydro was exclusively responsible for the calculation of the hydro component of the development charge in Schedule B. Carl Kropp, the General Manager and Chief Engineer of Ottawa Hydro, asserted in affidavit testimony that in order to ensure that the Ottawa Hydro component of the development charges reflected accurately the capital costs which would be incurred by Ottawa Hydro in servicing new developments, it engaged in extensive in-house analysis and relied heavily on the services of C.N. Watson and Associates Limited, a well-respected consulting firm on the subject of development charges.

In calculating the development charge, Ottawa Hydro used only the capital costs occasioned by new development. The operating

costs of servicing customers once the infrastructure is installed are specifically excluded and are charged through Ottawa Hydro's general rates, as approved by Ontario Hydro. The rationale is that on a system-wide basis, the operating costs remain more or less constant, regardless of whether they are related to old or new infrastructure. Incremental capital costs, on the other hand, can be more readily attributed to the class of consumer who caused them. It submits that the inclusion of the Ottawa Hydro component in the development charges permits a fairer allocation of costs among Ottawa Hydro's customers on the basis of the rate-making principle known as "cost-causality".

No issue was taken in this court or below as to the propriety of Ottawa creating a separate schedule limited to development charges for Ottawa Hydro nor with the charges themselves as being anything other than what is authorized by the Act. What the Foundation took exception to was the description given by Carl Kropp as to how the charges were arrived at. However, there is nothing to contradict his description and I am satisfied that there can be no argument that the charges embraced the following considerations:

(a) the new development's distance from the transformer station, measured in metres;

(b) the unit costs of the electrical distribution plant given in dollars/megawatt/metre; and,

(c)the magnitude of the new load, measured in kilowatts.

Ultimately, these calculations produced a comprehensive set of charges in relation to the capital costs to be incurred by Ottawa Hydro as a result of a new development. They were adopted by the City of Ottawa and incorporated into the Development Charges By-Law as Schedule B.

With regard to the development at issue, the Foundation has a service consisting of two main switches sized 1,600 A, 347/600V. Consequently, pursuant to Schedule B of the Development Charges By-Law, the development charges due and payable to Ottawa Hydro total $174,056.

Since the implementation of the Development Charges By-Law, Ottawa Hydro's capital expenditure budget has reflected anticipated revenues received from the development charges set out in Schedule B. Growth-related capital expenditures are offset by anticipated receipts from development charges such that the budget submitted to Ontario Hydro shows a lower capital requirement, thus reducing the level of the rates which would otherwise be charged to Ottawa Hydro's customers.

Although the City Treasurer is responsible for the collection of the Ottawa Hydro component of the development charge, the funds collected are maintained, on behalf of Ottawa Hydro, in a separate reserve fund (the "Development Charges Reserve Fund -- Ottawa Hydro"), which was established under By-law 281/91. Pursuant to s. 18 of the Development Charges By-Law, the City Treasurer must release to Ottawa Hydro, when demanded by Ottawa Hydro, that portion of the reserve fund required to fund growth-related capital costs. However, only those funds specifically required to fund a growth-related project are released to Ottawa Hydro. Consequently, it is submitted, there is no danger that the funds collected on behalf of Ottawa Hydro will be used for any purpose other than to defray the costs of growth-related capital expenditures necessary for the provision of hydro-electricity for completed projects.

Issue

Although, as indicated above, Ottawa Hydro raised three issues on appeal in its factum, the third ground was abandoned at the opening of argument. I have some difficulty with the proposition advanced by the second ground of appeal, namely, that the general language of the Act can override the express exemption of the Foundation from taxation on real and personal property contained in s. 16 of the Cancer Act. However, if the trial judge was in error in treating the Ottawa Hydro component of the development charges as a tax rather than a rate or charge, this second issue becomes academic. The sole issue then becomes:

Did the learned trial judge err in holding that the Ottawa Hydro component of the development charge is properly

characterized as "taxation" within the meaning of the Ontario Cancer Act?

Analysis

I have set out in some detail the facts relating to the manner in which the Ottawa Hydro development charges were determined because it is apparent to me, with great respect to the learned trial judge, that he misapprehended the evidence of Carl Kropp on this issue. While Kropp was cross-examined on his affidavit, I have not been shown where he altered his evidence in any material way. On its face, his testimony is no more than it purports to be, a straightforward description as to how the capital component of the electrical utility charges was determined for this specific new customer. The calculation of the capital cost of the installation of additional plant and equipment to provide this utility service is traditional to accepted methods of rate determination. On the face of this evidence, one can only conclude that the Ottawa Hydro component of the development charges to the Foundation was the incremental capital cost component of the electricity rate to the Foundation. As such, it is an addition to the rate base of Ontario Hydro and has no relation in law to a tax.

A feature of public utility regulation is the principle that utilities may not operate at a profit. Rather, one of the tenets of ratemaking is the provision of services at cost, a measurement which includes a reasonable rate of return reflecting the net capital requirements of the public utility. Public utility rates must be sufficient to meet current operating costs as well as costs to replace and acquire capital necessary for the service of the utility to consumers: see J. Bonbright et al., Principles of Public Utility Rates (Arlington: Public Utilities Reports, Inc., 1988) generally and particularly at pp. 6 and 22.

The starting point for an analysis of the mechanics of ratemaking begins with the notion that public utilities, given their special status, must function within a standard of reasonableness in rate setting: see Bonbright, supra, at ch. 10. The presumption which surfaces in the context of adjudication at rate hearings is that rates should reflect attempts at utility cost recovery. Public utilities strive not to operate beyond cost recovery, and rates to consumers are calculated in light of a public utility's rate base and specific return with respect to that rate base.

The rate base, simply stated, is the "amount of investment on which a regulated utility is entitled to a fair rate of return": see Canadian Institute of Resources Law, S.J. Bleckman, ed., Canada Energy Law Service, vol. 1 (Toronto: Carswell, August 1997) at pp. 4-9. The amount of investment reflects the value of the utility's assets that are used to provide services. Scholarly attention has focused on the various components of a utility's assets which are included or excluded from the assets of the utility for the purposes of rate base calculation. The determination of rate base is guided by formulae present in the legislation that governs particular utilities, as in s. 19(3) of the Ontario Energy Board Act, R.S.O. 1990, c. O.13, as amended, which provides that rate base includes a reasonable allowance for the cost of the property that is used or useful in serving the public less certain amounts, plus a reasonable allowance for working capital: see also Northwestern Utilities Ltd. v. Edmonton (City), [1929] S.C.R. 186, [1929] 2 D.L.R. 4, for a similar definition of rate base. It should be noted that the Ontario Energy Board has advisory powers with respect to Ontario Hydro, and the Board of Directors of Ontario Hydro establish electricity rates after considering the suggestions of the Ontario Energy Board, among other factors influencing their decision-making process. As a result the determination of rate base, within the meaning of the Ontario Energy Board Act, is applicable for Ontario Hydro for purposes of rate setting.

From the above perhaps oversimplified account of rate-making principles, it follows that these hydro charges are utility rates and not taxes. A public utility is only entitled to recover its costs in its rates, those costs including a reasonable rate of return on the utility's capital investments, and as such these rates are charges and not taxes. Taxes are of more general application and are intended to raise revenues: see Peter Hogg, Constitutional Law of Canada, 3rd ed. (Toronto: Carswell, 1994) p. 30-16.1 and infra. Indeed, it has long been recognized that electrical utility rates cannot constitute

taxes since they flow from the provinces' regulatory power over local works and undertakings set out in s. 92(10) of the Constitution Act, 1867: see Hogg at p. 29-17. This is so notwithstanding that utility rates may be added to the municipal tax roll and collected as "taxes": see Victoria & Grey Trust Co. v. North Bay (City) (1984), 44 O.R. (2d) 795 at pp. 799-800 (H.C.J.), and Guaranty Trust Co. of Canada v. Quality Steels (Canada) Ltd., [1953] O.R. 434 at pp. 444-45, [1953] 3 D.L.R. 296 (H.C.J.).

Unfortunately, the trial judge did not appreciate this legal background in his analysis. In his reasons he stated at p. 114:

> There was evidence by affidavit that the quantum of development charges was reached by a complicated formula. The development charges applicable to a new development are not based on the capital cost incurred in providing electricity to that development, but instead by another method entirely, and this calculation may not be the same as those utilized by other municipalities which have enacted development charge by-laws.
>
> The development charges paid by subscribers pursuant to the by-law are placed in a general fund, and held in trust for Ottawa Hydro by the Municipality. Furthermore, there is no direct correlation between the development charges rendered on a project and the recovery of those specific charges by Ottawa Hydro.

The trial judge then canvassed the case-law defining a "tax", and concluded that the Ottawa Hydro component of the development charges was a tax, and then summarily concluded that the Foundation was exempt from the development charges.

With great respect to the trial judge, the above-quoted reasons do not reflect an analysis of the evidence as to how Schedule B was arrived at by Ottawa Hydro. The reasons reflect the generality of development charges authorized by the Act. Very clearly, the development charges determined by Ottawa Hydro in Schedule B are the incremental capital costs incurred by Ottawa Hydro in providing electricity to the Foundation. These charges are attributed directly to the Foundation as the incremental capital component of the utility rate for the delivery of electricity to it as a customer. In the result, the Foundation is billed when service commences at the blended rate of capital and commodity charges billed to equivalent users prior to the construction of its new facility. These incremental capital costs may be calculations based on historical costs but, as with all such rate-making calculations, they become current and very real when they are collected from the Foundation through the mechanism provided by the Development Charges By-Law after the installation of the specific equipment that enables Ottawa Hydro to effect delivery to the Foundation of its utility service, namely electricity. To the extent that the above-quoted reasons of the trial judge constitute a finding of fact as to how the development charges in issue were determined, they constitute palpable and overriding error.

With respect to the legal categorization of these charges as taxes, the trial judge relied, in part, on the judicial reasoning from Ontario Home Builders' Assn. v. York Region Board of Education in the Divisional Court (1993), 13 O.R. (3d) 493, 103 D.L.R. (4th) 55, and in the Court of Appeal for Ontario (1994), 17 O.R. (3d) 103, 109 D.L.R. (4th) 289. This case was later heard and decided by the Supreme Court of Canada ([1996] 2 S.C.R. 929, 137 D.L.R. (4th) 449). In this court, Foundation relies on the Divisional Court judgment ((1993), 13 O.R. (3d) 493) which concluded that the education development charge passed under a by-law enacted pursuant to Part III of the Act is a tax and falls squarely within the exemption provided to the foundation by s. 16 of the Cancer Act. The Divisional Court's characterization of these charges as a tax was undisturbed, indeed it was not discussed, in the later decisions of this court and the Supreme Court of Canada.

It is important to recognize that by the time Home Builders' reached the level of the Supreme Court of Canada, the parties had accepted the initial classification of the Divisional Court below that the education development charges were taxes. The Divisional Court concluded that they were indirect taxes and therefore ultra vires the province as contrary to s. 92(2) of the Constitution Act, 1867. The Court of Appeal agreed that they were indirect taxes but reversed the Divisional Court

because the taxes were ancillary or adhesive to a regulatory scheme falling within provincial responsibility under one or more of s. 92(9), (13) and (16) of the Constitution Act, 1867.

By the time the matter reached the Supreme Court of Canada, the issue appeared to be framed as a constitutional argument as to whether they were indirect taxes (and thus ultra vires the legislative competence of the province) or direct taxes (and thus intra vires). The majority judgment was delivered by Iacobucci J. on behalf of himself and four members of the court. He held that the education development charges were indirect taxes and thus ultra vires provincial competence under s. 92(2) of the Constitution Act, 1867. However, the education development charges scheme, composed of a related group of statutes governing land development in Ontario, were ultimately intra vires the province as ancillary to a valid regulatory scheme for the provision of educational facilities as a component of land use planning, pursuant to s. 92(9) (licences to raise money), (13) (property and civil rights) and (16) (matters of a local nature) of the Constitution Act, 1867. In so holding, he made it clear that the justification for the imposition of these indirect taxes was that the educational development charges scheme is limited in scope and operates solely so as to defray the costs of regulation.

La Forest J., for the minority consisting of himself and three other judges, concurred in the result but held that the taxes were intra vires the province because they were taxes on land and therefore direct taxes.

The only reported discussion in Home Builders' respecting the threshold issue whether educational development charges imposed pursuant to Part III of the Act were taxes at all, took place in the Divisional Court before a panel consisting of O'Driscoll, White and McKeown JJ. That court was faced with an application, brought by the Ontario Home Builders' Association and others, to quash by-laws passed by the respondents, certain school boards, which imposed educational development charges. The case considered the constitutional validity of the impugned by-laws. To that extent, the case is not relevant. However, the Divisional Court's consideration of the scheme of imposing and calculating educational development charges is relevant because both the Court of Appeal and Supreme Court did not consider whether they were taxes per se, implicitly accepting the Divisional Court's conclusion on that point.

The majority reasons as to the characterization of the educational development charges were delivered by McKeown J. He made the following analysis of these charges at pp. 497-99:

> Part III of the Development Charges Act gives school boards the authority to pass by-laws that impose education development charges. Section 30 is the operative section and provides that an education development charge is imposed "against land undergoing residential and commercial development" (emphasis added) where that development will give rise to the need for new schools directly attributable to it. Section 29 of the Development Charges Act defines an education development charge as:
>
> > "education development charge" means a development charge imposed under a by-law passed under section 30 respecting growth-related net education capital costs incurred or proposed to be incurred by a board;
>
> Where residential and commercial development gives rise to a need for new schools directly attributable to land development, this is known in s. 29, Part III of the Development Charges Act as a "growth-related net education capital cost". "Growth-related net education capital cost" is calculated pursuant to a statutory and regulatory formula whereby the public or separate school board that wishes to impose an education development charge shall:
>
> (1) estimate what new school facilities will be needed as a consequence of the development and the cost of these facilities;
>
> (2) calculate the amount chargeable to each new home so that it can be expressed and levied on a per-unit basis at the time each building permit is issued; and
>
> (3) submit a proposal for anticipated capital needs and an estimate of the education development charge to the

Minister of Education for review and approval.

Once the education development charge is approved by the Minister of Education, the board may pass the by-law pursuant to Part III of the Act. The municipality then becomes the collector of the charge pursuant to the Development Charges Act and the charge is payable on a per-unit basis when a building permit is issued (s. 35(3)). If two or more boards in the same area pass by-laws, then both charges must be paid when the permit is issued. An account is then established, or a joint account if two or more boards levied the charges and the money is deposited into that account. No money can be withdrawn from this account unless the actual project (as opposed to the estimate made in contemplation of the by-laws described above) is given final approval by the Minister of Education.

Ontario Regulation 722/89 sets out the methodology that school boards must follow to ascertain their eligibility for education development charges and to calculate them. When a school board calculates a proposed education development charge, it cannot include the capital costs associated with renovating schools for existing pupils, or building schools for existing pupils currently accommodated in portables or bussed to distant schools. The projected capital costs must be based on the board's projection of the number of new pupils that it anticipates will be entitled to education within its jurisdiction as a result of the new development.

McKeown J. further considered the nature of levies imposed by a province generally and held as follows at p. 505:

> It is well understood that not every levy imposed by a province is "taxation" within the meaning of s. 92(2). The distinction between "taxation" and "charge" is that the latter is money collected to defray the cost of specific services rather than to raise revenue for general purposes. As Peter Hogg concluded, in his book, Constitutional Law of Canada, 2nd ed. (Toronto: Carswell, 1985), at p. 613:
>
> > These charges are not necessarily taxes, and if they are not they need not be direct. They are not taxes if they can be supported as regulatory charges imposed under one of the province's regulatory powers . . . These can be supported as regulatory charges if they are taken in payment for a specific governmental service, and if they bear a reasonable relation to the cost of providing the service, -- whether it be the issue of a licence . . . the provision of a bridge, or the supply of water. These charges are not taxes because their purpose is to defray expenses, not to raise revenue.

The definition of "development charge" in Part I of the Act is virtually the same as that of "educational development charge" in Part III except that it is not restricted to education and refers to net capital costs that are incurred by the municipality or a local board thereof. The definitions are identical in that they permit the recovery as charges of "costs incurred or proposed to be incurred". Accordingly there appears to be no objection to having the municipality determine what actual costs are to be charged where such a determination is feasible. When the latter is done, it would appear from comments made as obiter by McKeown J. that the characterization of the charge may well be different. He stated at p. 506:

> However, we should point out that, while everyone taking up residence in the new land development will use sewers and side-walks, not everyone will use the schools. It is not enough to say that every homeowner benefits indirectly through potential capital appreciation: Howay v. Caradoc (Township) (1991), 6 M.P.L.R. (2d) 70 (Ont. Gen. Div.) at p. 73. Furthermore, a review of Parts I and II of the Development Charges Act shows that the municipality is regulating the development industry, whereas in Part III of the Act, the municipality through its local school boards is levying a charge or tax and is making no attempt to regulate the schools. There is nothing in Part III, or the regulations passed pursuant thereto, regulating schools. The Act and regulations set out how to levy and calculate a charge, when the charge expires, and how to collect it.

McKeown J. further held that at p. 507:

> While schools are an integral part of community life, they are no more services akin to sewers and waterlines than are

> courts and post offices. It is not useful to compare the construction of schools to the provision of direct municipal services that the community requires in order to function on a daily basis. Schools are not like street lights that perform one function, a physical function. We no more view our schools in such a way than we do our criminal courts, hospitals or the town hall . . . While this charge may not be imposed to "raise revenue for general purposes" as conventionally understood, it is much closer in nature to a tax for raising revenue than it is to a charge to defray costs.

These comments can be taken to suggest that McKeown J. would not have made the same finding had he been faced with a levy for "direct municipal services". McKeown J. appeared prepared to accept that certain levies for municipal services may be properly characterized as charges. With this in mind, it appears that McKeown J. did not wish that the scope of his reasoning should extend to development charges generally. Rather, it suggests that the scope of his reasoning should not extend to the hydro component in the case in appeal because it is very much like those municipal services that are used by the community on a daily basis. In our case, the hydro component of the development charge comprises the cost to the development of two switches which are required for the operation of the Foundation; this is not an anticipated cost based on usual municipal requirements, but is as a determination of the actual needs of the development.

Moreover, McKeown J. concluded that the cases which held that a levy is a charge in the context of non-constitutional cases are not dispositive in constitutional cases. The present appeal is not as a constitutional case. As a result, the cases which concluded that a levy is as a charge, such as Cariboo College v. Kamloops (City) (1982), 18 M.P.L.R. 85, 133 D.L.R. (3d) 24 (B.C.S.C.), are still instructive.

In essence, the decision in this case will depend on the characterizations of the administration of the development charges regime in the City of Ottawa. The Foundation argues that this is an improper inquiry. It submits that the question of whether development charges constitute taxation must be answered by reviewing the legislative scheme that authorizes the passage of the operative by-law, not by considering the by-law itself. According to the Foundation, the appeal involves, in part, the characterization of the province-wide enabling statute which authorizes the imposition of a scheme of taxation to raise revenue for capital construction of public works and facilities. If this is correct, the submission is that it is irrelevant how Ottawa calculates and administers its development charges program.

I think that the Foundation is wrong on this point. The question on appeal seeks to determine whether the Ottawa Hydro component is a charge or a tax. To do so, it is necessary to consider how the charge is measured and collected. This must be specific to the Development Charges By-Law of the City of Ottawa. The implication of this is that future litigation would arise whereby municipalities and hydro authorities are tested as to their particular administrative mechanisms in place. This may be so, but there are no constitutional impediments to what the City of Ottawa has done and the Foundation has not raised any objections to the decision of the City to isolate the hydro charges from the other development charges and set them out as Schedule B. Certainly the concept that Ottawa Hydro's ratepayers should be spared the incremental capital costs of providing service to new developments is fully within the spirit of the Act.

While I do not think that the fact that the Development Charges By-Law was passed under Part I of the Act as opposed to Part III has any significance to the outcome of this appeal, it is clear that the courts in Home Builders' were not dealing with electrical rates per se. It is also clear that, historically, utility rates have not been considered as taxes by the courts and we have not been referred to any authority which suggests that there is movement away from this traditional approach. I include in this observation, the Home Builders' case. In my opinion, the error in the judgment under appeal is that instead of analyzing the evidence of Kropp as to how the Ottawa Hydro charges in Schedule B were arrived at, the trial judge looked at the scheme of the Act and the broad parameters therein set forth for the determination of development charges in general, without recognizing that within

those parameters there could be levies or charges that were not taxes.

Disposition

For the reasons set out above, I would allow the appeal, set aside the judgment below and in its place substitute a judgment dismissing with costs the application by the Foundation for a declaration that it is not subject to the development charges set out in Schedule B to the Development Charges By-Law. Ottawa Hydro is entitled to its costs of this appeal.

OSBORNE J.A. (LABROSSE J.A. concurring): -- I have had the advantage of reading the reasons for judgment of my colleague Finlayson J.A. He has concluded the hydro component of the City of Ottawa's development charge is not a tax and that the exemption from taxation claimed by the respondent ("Cancer Foundation") provided by s. 16 of the Cancer Act, R.S.O. 1990, c. C.1, is thus not engaged. I have reached a different conclusion. In my view, Part I, Development Charges ("DC"), imposed under the Development Charges Act, R.S.O. 1990, c. D.9 (the "DCA"), are taxes that come within the ambit of s. 16 of the Cancer Act, with the result that the Cancer Foundation is exempt from this form of taxation. Thus, I think that the appeal should be dismissed. What follows are my reasons for reaching that conclusion.

Overview

I think that the central question is whether DCs imposed under Part I of the DCA constitute taxation. In my view, the answer to that question is, yes. I reach that conclusion on the basis of my analysis of the structure of the DCA and the City of Ottawa by-law passed under the authority of that Act. I am supported in my conclusion by the Supreme Court of Canada's judgments in New Mount Sinai Hospital v. Toronto (City), [1973] S.C.R. 541, 34 D.L.R. (3d) 438, and Ontario Home Builders' Assn. v. York Region Board of Education, [1996] 2 S.C.R. 929, 137 D.L.R. (4th) 449. I will refer in more detail to both cases later. For now, I note that in Ontario Home Builders' the Supreme Court of Canada unanimously agreed that education development charges ("EDC") (dealt with in Part III of the DCA) are taxes. The only difference of opinion within the Supreme Court of Canada was on the issue whether the EDC was a direct or indirect tax. I see no difference in substance, or principle, between EDCs and DCs for purposes of determining whether DCs are taxes.

In my opinion, it is the DCA scheme, not what the City of Ottawa, or Ottawa Hydro, does with the relevant DCs, or what the DCs replace, that is significant in the required analysis. The DCA contemplates a DC payment to cover all service areas listed in the municipal corporation's development charge by-law ("DCB"). The service area (electrical) provided by Ottawa Hydro is but one of the service areas listed in that by-law. The payment of a DC is triggered by a list of statutory development-related events, one of which is the issuance of a building permit. It is the payment of the DC, made under the authority of the DCA and in this case the City of Ottawa DCB, that I think must be considered to answer the question whether that payment is the payment of a tax for purposes of s. 16 of the Cancer Act.

My colleague has referred to some of the evidence that was before the motions judge, Binks J., and I will thus limit my references to the evidence to aspects of it that I think are important to give some reasonable factual context to my analysis. That analysis must begin with a consideration of the DCA.

The Development Charges Act

The applicable version of the DCA was given third reading on November 22, 1989 and proclaimed into force on November 23, 1989. It was intended to bring uniformity and order into development -- growth-related municipal costs. The DCA replaced, among other things, the existing lot levy system. By late 1989 lot levies had increased substantially, as municipal corporations grappled with reduced grants and increased growth-related costs and it was thought, at a political level, that a new system had to be devised to permit municipalities to recover growth-related capital costs. The new system is set out in the DCA. The underlying economic philosophy of the DCA is that growth (development) should pay for the infrastructure

costs that it generates. Such costs, generally speaking, should not be borne by existing residents. The purpose of DCs was described in this way by the Ontario Municipal Board in Sudbury (Regional Municipality) Development Charges By-law 91-150 (Re) (1993), 30 O.M.B.R. 210 at p. 223:

> If the Board looks at the purposes of development charges, it is to provide a pool of funds which allows the capital expenditures required by development to be borne by those people who will benefit from the services and not to impose the capital costs for developments on the whole of the municipality. The method by which the municipality has determined to collect these fees is that they are payable when a building permit is obtained. It is the building permit which triggers the collection of the taxes or charge. In most circumstances, this provides for an equitable collection of the development charge on the property.

The DCA is divided into four parts. Part I concerns the municipal DCs, which are of concern in this case, Part II front-end payments, Part III education development charges, and Part IV general provisions.

I set out below sections of the DCA that I think are relevant for the purposes of this appeal:

1. In this Act,

"capital cost" means costs incurred or proposed to be incurred by a municipality or a local board thereof directly or under an agreement,

(a) to acquire land or an interest in land,

(b) to improve land,

(c) to acquire, construct or improve buildings and structures,

(d) to acquire, construct or improve facilities including,

(i) rolling stock, furniture and equipment, and

(ii) materials acquired for circulation, reference or information purposes by a library board as defined in the Public Libraries Act, and

(e) to undertake studies in connection with any of the matters in clauses (a) to (d)

required for the provision of services designated in a development charge by-law within or outside the municipality, including interest on borrowing for those expenditures under clauses (a), (b), (c) and (d) that are growth-related;

"development charge" means a charge imposed with respect to growth-related net capital costs against land under a by-law passed under section 3;

"development charge by-law" means a by-law passed under section 3;

"growth-related net capital cost" means the portion of the net capital cost of services that is reasonably attributable to the need for such net capital cost that results or will result from development in all or a defined part of the municipality;

"local board" means a local board as defined in the Municipal Affairs Act, other than a board defined in subsection 30(b);

"net capital cost" means the capital cost less capital grants, subsidies and other contributions made to a municipality or that the council of the municipality anticipates will be made, including conveyances or payments under sections 42, 51 and 53 of the Planning Act, in respect of the capital cost;

"services" means services designated in a development charge by-law or in an agreement under section 21, as applicable;

3(1) The council of a municipality may pass by-laws for the imposition of development charges against land if the development of the land would increase the need for services

and the development requires,

(a) the passing of a zoning by-law or of an amendment thereto under section 34 of the Planning Act;

(b) the approval of a minor variance under section 45 of the Planning Act;

(c) a conveyance of land to which a by-law passed under subsection 50(7) of the Planning Act applies;

(d) the approval of a plan of subdivision under section 51 of the Planning Act;

(e) a consent under section 53 of the Planning Act;

(f) the approval of a description under section 50 of the Condominium Act; or

(g) the issuing of a permit under the Building Code Act in relation to a building or structure.

. . . . .

(3) A by-law passed under subsection (1) shall,

(a) designate those uses of land, buildings or structures upon which a development charge shall be imposed;

(b) designate the areas within which a development charge shall be imposed;

(c) establish the development charge, or the schedule of development charges, to be imposed in respect of the designated uses of land, buildings or structures; and

(d) designate services for which a development charge may be imposed.

. . . . .

(6) No land, except land owned by and used for the purposes of a board as defined in subsection 30(6) or a municipality, is exempt from a development charge under a by-law passed under subsection (1) by reason only that it is exempt from taxation under section 3 of the Assessment Act.

. . . . .

9(1) A development charge is payable on the date a building permit is issued in relation to a building or structure on land to which a development charge applies.

(2) Despite any other Act, a municipality is not required to issue a building permit in relation to a building or structure on land to which a development charge applies unless the development charge has been paid.

. . . . .

11. A municipality that has passed a development charge by-law may register the by-law or a certified copy of it on the land to which it applies.

12(1) If the development charge or any part thereof imposed by a municipality, other than an upper tier municipality, remains unpaid after the due date, the amount unpaid shall be added to the tax roll and shall be collected as taxes.

(2) If the development charge or any part thereof imposed by an upper tier municipalities remains unpaid after the due date, the treasurer of the upper tier municipality shall certify to the treasurer of the area municipality in which the land is located that the amount is unpaid and the amount unpaid shall be added to the tax roll of the area municipality and shall be collected as taxes.

. . . . .

16(1) Payments received by a municipality under this Part shall be maintained in a separate reserve fund or funds and shall be used only to meet growth-related net capital costs for which the development charge was imposed.

. . . . .

17. The treasurer of the municipality shall, in each year, on or before such date as council may direct, furnish to the council a statement in respect of each reserve fund established under section 16 containing the information prescribed.

. . . . .

19. The Lieutenant Governor in Council may make regulations,

(a) prescribing, for the purposes of section 3, the manner in which development charges shall be calculated;

. . . . .

(c) prescribing, for the purposes of section 3, those services for which development charges shall not be imposed;

. . . . .

49. In the event of a conflict between this Act and any other general or specific Act, this Act prevails.

A DC is a charge imposed with respect to growth-related net capital costs under a municipal by-law passed under the authority of s. 3(1) of the DCA. Growth-related net capital costs is that part of "the net capital cost of services that result or will result from development". "Services" is not defined in the DCA or the regulations. I will return to the matter of municipal "services" when I consider the City of Ottawa's DCB. For now, I note that it is the growth-related capital cost of "services" identified in the municipality's DCB that attract DCs.

Under the authority provided in s. 3(1) of the DCA, the council of a municipality may pass by-laws providing for the imposition of DCs against land if the development of the land would increase the need for services, and if the development requires any one of the seven development-related steps set out in s. 3(1)(a) to (g). One development-related triggering event is the issuance of a building permit.

The collection of DCs is governed by ss. 9, 10 and 12 of the DCA. All that needs to be said about this subject is that a DC is payable when a building permit is issued for a development (such as the Cancer Foundation extension) on land to which the DC applies (s. 9(1)). The municipality is not required to issue a building permit until the applicable DC has been paid (s. 9(2)). A municipality that has passed a DCB may register it on the land to which it applies and if the DC, or any part of it, remains unpaid the unpaid DC is added to the tax roll and may be collected as taxes (ss. 11, 12(1) and (2)).

The municipal treasurer is responsible for collecting DCs and must annually provide the municipal council with a statement in respect of every DC reserve fund established under the DCA and the municipality's DCB.

Neither Part I of the DCA nor its Regulation 267, R.R.O. 1990 ("Regulation"), set out in any detailed way how DCs are to be calculated. Instead, the Regulation prescribes somewhat broad principles which must be followed in calculating DCs. Section 3(1) of the Regulation requires the municipality to base its calculation of DCs on the provision of services at standards no higher than the standards at which those services were provided at the time the by-law is passed or have been provided at any time in the preceding 10 years.

Section 4(1) of the Regulation requires that the calculation of DCs be based on growth-related net capital costs for a period not exceeding ten years from the date that the DCB comes into force. Section 4(2) of the Regulation provides that DCs for water supply services, sanitary sewer services, storm drainage surfaces, transportation services, and waste disposal services may be based on estimated growth-related net capital costs for a period exceeding ten years.

Under s. 16 of the DCA, DCs received by the municipality must be maintained in a separate reserve fund or funds. Section 16 provides that DCs can be used only to meet growth-related net

capital costs for which the DC was imposed. Section 12 of the Regulation requires the municipal treasurer to include in the information contained in his annual statement the amount of DCs that were refunded or "allocated to other services" (s. 12, para. 4). This suggests that a municipality may spend DCs, deposited as required in a reserved fund, in other service areas set out in the DCB. The municipality's flexibility depends upon the by-law. I will return to this subject shortly.

In summary, DCs are collected for the general public purpose of regulating and providing for the growth-related net capital costs assumed to be created by development. They are not collected to defray the specific capital costs attributable to a particular development. The hydro component of the City of Ottawa's DC, if paid by the Cancer Foundation, would not necessarily be spent on paying capital costs attributable to the Cancer Foundation's expansion. The DCA allows for DCs to be imposed through the municipality's DCB on the basis of a prediction of growth-related net capital costs of future development. The prediction is based on a calculation not prescribed in the Act or its regulations, however, it will necessarily be somewhat imprecise and not directly site specific.

The City of Ottawa Development Charges Act By-Law

On November 6, 1991, the City of Ottawa passed By-law 279-91, the City's DCB, under the authority of s. 3(1) of the DCA. The preamble in the by-law contained five recitals, two of which I think go to make clear the underlying assumption in the by-law is that "development" will increase the need for services:

> Whereas the Development Charges Act, 1989, S.O. 1989, c. 58 authorizes municipalities to pass by-laws for the imposition of charges against land or the development of the land would increase the need for services.
>
> . . . . .
>
> And whereas development will increase the need for municipal services.
>
> (Emphasis added)

This approach is consistent with the philosophy of the DCA -- growth will increase municipal infrastructure costs and growth should pay for the capital costs that it generates. The Ottawa DCB follows the structure suggested by the DCA and its regulations. The by-law applies to all land in the City of Ottawa, apart from that land that is exempted by s. 11 of the by-law. It prohibits the development of land except in accordance with the by-law and provides that DCs collected under the by-law shall be used for 11 specified municipal and hydro-electric services. The services are:

(a) fire stations, vehicles and equipment;

(b) police facilities and equipment;

(c) storm sewer systems;

(d) sanitary sewer systems;

(e) highways, including sidewalks;

(f) parkland development;

(g) community activity and sports and recreation facilities;

(h) library facilities;

(i) cultural facilities;

(j) services provided by Ottawa Hydro;

(k) administrative services in the corporation and Ottawa Hydro relating to the services referred to in subsections (a) to (j) above.

As is evident, "services provided by Ottawa Hydro" is but one of the listed service areas. The City of Ottawa's DCB provided that the method of calculation of the DC be in accordance with the "rates" set out in Schs. A and B annexed to the by-law (see By-law 279/91, ss. 3, 5 and 6). The by-law makes it clear that

the DC payable is the total of the City of Ottawa's component of the DC, which includes all identified services, except hydro, plus the hydro component. Schedules A and B of the by-law set out how the applicable DC is to be calculated (Sch. A for the City of Ottawa services component, and Sch. B for the Ottawa Hydro service component).

The calculation of the City of Ottawa DC component for a residential development, set out in Sch. A, is based on habitable floor area. For example, construction of a single detached dwelling containing 102 square metres, or more, of habitable floor area required a DC payment of $2,242 in the April 1, 1992 to March 31, 1993 period. Schedule A ratchets the DC upward in each year of the five-year life span of the by-law with the result that construction of the same single-family detached dwelling required a DC payment of $3,417 in 1995. For a single or two-unit residential dwelling, the Ottawa Hydro component of the DC, set out in Sch. B, is a flat rate of $479 per unit. For a row dwelling, the Ottawa Hydro DC component is $335 per unit.

For a non-residential development, such as the Cancer Foundation building, Sch. A provides that the DC, referable to all services but Ottawa Hydro, is $16.15 per square metre of gross floor area. This part of the DC is not in issue because the City of Ottawa gave the Cancer Foundation a grant in an amount equal to the non-hydro component of the DC.

The hydro component of the DC for a development such as that undertaken by the Cancer Foundation is calculated on the basis of three identified criteria: the distance of the development from the transformer station, the unit cost of the electrical distribution plant, and the magnitude of the new load. Mr. Kropp, who gave evidence in this matter for Ottawa Hydro, stated that Ottawa Hydro resorted to averaging and predicting, consistent with the principles of rate making, in its calculation of all of the component elements of the Ottawa Hydro DC. Thus, two identical facilities, like the Cancer Foundation building, built with identical switches, would attract the same DC, even though one of them was much further from the transformer station than the other. As Finlayson J.A. has correctly noted, no issue is taken with the calculation, or the method of calculation of the Ottawa Hydro component of the DC attracted by the Cancer Foundation's application for a building permit for its expansion. I refer to the calculation of DCs under the City of Ottawa's DCB only to note the capital cost assumptions that underlie the calculation of DCs and to explain that the growth-related capital costs are not truly site specific. As I have said, the DCA scheme assumes and predicts that development will give rise to growth-related municipal infrastructure costs in all of the service areas (including Ottawa Hydro) set out in the by-law.

Section 21(2) of the Ottawa DCB provides that DCs collected pursuant to the by-law shall be allocated in accordance with Sch. C, which is a part of the by-law. That schedule provides a percentage allocation of DCs paid under the by-law. For example, under Sch. C for a building such as the Cancer Foundation building, 31.59 cents of each DC dollar would be allocated to transportation, 11.60 cents to administration and 2.62 cents to libraries. Each of the ten service areas is given a prescribed share of the DC dollar. This allocation will occur whether or not a particular development increases the need for transportation facilities, administration or libraries (or any of the other identified service areas).

The Ottawa Hydro service component is set apart in Sch. C of the by-law. The percentage allocation of all services except Ottawa Hydro totals 100 per cent and is referred to in the schedule as "City subtotal". "Electrical", that is Ottawa Hydro, is separately allocated as 100 per cent.

Section 17 of the Ottawa DCB requires the municipal treasurer to maintain a separate reserve fund for that part of the DC attributable to hydro-electric services as set out in Sch. B. The by-law makes no reference to a separate reserve fund or funds for the non-hydro part of the DC; however, Ottawa's municipal council passed two further by-laws on November 6, 1991, By-laws 280/91 and 281/91. By-law 281/91 is in the material. By-law 280/91 is not. By-law 281/91 provided that DCs deposited in the Ottawa Hydro reserve fund shall be used to pay DCs "for the growth-related portion of net capital costs for which the development charges were imposed to the extent there exists a positive balance in the fund intended for that

purpose".

By-law 280/91 (which I have reviewed since it is a public document) completes the DCA circle by creating a reserve fund for all other, that is non-hydro, services set out in Ottawa's main DCB, "segregated according to Schedule A attached hereto". Schedule A attached to By-law 280/91 contains the same breakdown of service elements that are in the City of Ottawa's main DCB.

In the final analysis, through its three November 6, 1991 by-laws, the City of Ottawa established two reserve funds, one for DCs related to all of the identified services elements except hydro, and the other for hydro.

Analysis

The appellant submits that the central issue is whether the hydro component of the DC imposed on the Cancer Foundation is properly characterized as taxation for purposes of s. 16 of the Cancer Act.

The appellant contends that the hydro component of the DC is a regulatory charge, not a tax. In support of its position, it points to the existence of the separate reserve fund for the hydro component of the DC and restrictions imposed by the by-law on the use of DCs in that reserve fund.

The appellant notes that the hydro component of the DCs can only be used for future growth and hydro-related net capital costs, not for a general public purpose. The appellant also looks to the manner in which Ottawa Hydro defrayed its capital costs before November 1991, when the City of Ottawa opted into the DCA scheme. The appellant submits that Ottawa Hydro has done no more than to choose to recoup its growth-related infrastructure costs by DCs, instead of by hydro rates. Since the capital component of the pre-DCA hydro rates (paid by all ratepayers) was not a tax, the appellant submits that the substitute -- the hydro component of the DC -- is not a tax. The appellant contends that these features of the DCA and the City of Ottawa DCB support its submission that the hydro component of the DC is a regulatory charge, not a tax.

I agree with the appellant that not every charge or levy imposed by the province constitutes taxation. I do not, however, agree that the question to be answered is whether payment of the hydro component of the DC constitutes payment of a tax. Moreover, I do not think that the limited use that can be made of the hydro component of the DC is determinative. This approach ignores the other service areas in the by-law and focuses the analysis entirely on the hydro component of the DC. As I have said, I think that the issue should be cast more broadly. I do not agree that since the hydro component of the DC became the substitute for the capital component of the pre-November 6, 1991 hydro rates, it follows that the hydro part of the DC is a rate, not a tax. Indeed, because I frame the issue differently, I think that if there is to be a before and after comparison, it should focus on lot levies and DCs. DCs replaced lot levies; lot levies were a form of taxation: see Palisade Properties (1985) Ltd. v. Surrey (District) (1991), 5 M.P.L.R. (2d) 206 at p. 208 (B.C.S.C.), and Sorokolit v. Peel (Regional Municipality) (1977), 16 O.R. (2d) 607 at p. 612, 78 D.L.R. (3d) 715 (Div. Ct.). I do not, however, think that this analysis is productive. In my view, the DC scheme should be assessed for what it is, not on the basis of an assessment of what it replaced.

I turn first to consider the approach that I think should be taken to determine if the Cancer Foundation is entitled to the taxation exemption in s. 16 of the Cancer Act. In my opinion, it is the DCA in its entirety and all of Ottawa's DCB that must be assessed. The hydro component of the Ottawa DCB should not be excised from the DCA scheme to determine whether it alone is a tax. I find support for this analytical approach in the judgments of this court and the Supreme Court of Canada in Ontario Home Builders', supra. In this court ((1994), 17 O.R. (3d) 103) Carthy J.A. concluded that EDCs were an element of the planning process and that they replaced lot levies imposed as a condition of subdivision approval under the Planning Act, R.S.O. 1990, c. P.13. In his analysis, he did not accept Ontario Home Builders' argument that he thought tended to isolate the construction of schools as the responsibility of the school boards from the municipality's responsibility to regulate land development. At p. 112, he said that this

argument:

> . . . overlooks the fact that we are testing provincial powers, not the powers of the school board. The constitutionality of the charges must be the same whether imposed directly by the province, by delegation to the municipality to exercise in tandem with land use control, or by a combined delegation, as here, to the school boards to impose the charges, and to the municipality to collect them. Throughout, the ultimate control is retained by the Minister of Education.

(Emphasis added)

Carthy J.A.'s observations have application here. Like EDCs, the hydro component of the City of Ottawa DC is, nonetheless, a DC. It is, as Carthy J.A. put it, "the provincial powers" that must be tested, not the powers of Ottawa Hydro.

In the Supreme Court of Canada, writing for the majority Iacobucci J. accepted that EDCs are part of a comprehensive integrated scheme "namely, the entirety of planning, zoning, subdivision and development of land in the province". His analysis of the DCA supports my view that the entire DC scheme should be looked at to determine if the Cancer Foundation is entitled to the Cancer Act taxation exemption.

The DCA scheme manifestly was intended to apply throughout the province, in respect of those municipalities that chose to participate by passing a DCB. To narrow the focus of the review to one part of one municipality's DCB would lead to unacceptable fragmentation and instability since a component of one municipality's DC would be a tax in that municipality and not a tax in another depending upon the form of the municipality's by-law. More particularly, the precise construction undertaken by the Cancer Foundation would attract payment of the hydro component of the applicable DC in one municipality, but not in another, since the DC payment would be characterized as payment of a tax in one municipality, but not in another. My colleague accepts the prospect of this distortion. I do not. In my opinion, DCs are part of a comprehensive provincial scheme designed to permit participating municipalities to defray growth-related net capital costs. The payer of the DC makes one payment that covers the total DC for all service areas set out in the by-law.

It was the City of Ottawa, not Ottawa Hydro, that determined to pass a DCB and to include Ottawa Hydro as one of its 11 identified service areas. As a practical matter, Ottawa Hydro would not have been included as a service area had it not agreed. Nonetheless, it was the City of Ottawa's decision to pass a DCB and the City had the final say in what services would be listed in its by-law. Indeed, I question what standing Ottawa Hydro has on this appeal. It seems to me that it is the City of Ottawa that should be the appellant. However, since this issue has not been raised, I will proceed on the basis that Ottawa Hydro is the proper appellant.

Virtually all that distinguishes Ottawa Hydro from the ten other service areas listed in the by-law is the provision requiring the hydro component of the DC to be deposited in a separate reserve fund that is not mingled with the DCs allocated to the other ten selected service areas. But the fact remains that hydro is but one among 11 service areas set out in the by-law. I do not think that Ottawa Hydro can properly be isolated from the broader scheme (the DCA), or from the other service areas set out in the by-law. Either the whole DC (including its hydro component) is a tax, or it is not. The components are part of the whole and should not be divided for purposes of this analysis.

Is a DC a Charge or a Tax?

A tax is a compulsory levy imposed by law for a public purpose by a public body: see Lawson v. Interior Tree Fruit & Vegetable Committee of Direction, [1931] S.C.R. 357. DCs fit within that definition, in my opinion. Nonetheless, it has been recognized that many charges also fit within the broad definition of a tax. In result, a further examination of the difference between a charge and a tax is required in the context of DCs imposed under the DCA.

The distinction between a charge and a tax was considered in

Reference re Powers of Municipalities to Levy Rates on Foreign Legations & High Commissioners' Residences, [1943] S.C.R. 208, [1943] 2 D.L.R. 481. In that case the Supreme Court of Canada had to consider whether the City of Ottawa could levy rates on real property used by foreign states as legations. Duff C.J.C. expressed the view that real property taxes could not be extracted from diplomatic representatives or the sovereign states that they represented. At p. 222, he distinguished real property taxes from charges such as licence fees, bridge tolls, stamp duties, water rates and electric rates that he accepted were charges which "are taken in payment for specific services rendered directly to the particular individual who pays for them". In La Forest, The Allocation of Taxing Power Under the Canadian Constitution (1967), at p. 58, the author endorsed Duff C.J.C.'s analysis of the distinction between a charge and a tax.

A DC is paid by the developer/owner in a lump sum. The DC is not paid for particular services of which the owner/developer is the direct beneficiary. That is to say the DC imposed bears no relationship to the value to the developer of the capital expenditure that the DC is intended to defray. Whether the burden of the DC will be passed on to others will be dependent upon economic circumstances and is an issue which need not be discussed here. It is an issue which is relevant to the question whether a DC, if a tax, is an indirect tax or a direct tax.

The significance of restrictions on the use of special levy funds as a factor in determining whether a special levy was a tax was considered by the Supreme Court of Canada in Mount Sinai, supra. In that case, the City of Toronto, acting under the authority of the City of Toronto Act, 1961-62, S.O. 1961-62, c. 171 ("City of Toronto Act") levied a special sewer charge against the hospital. The hospital applied for a declaration that it was exempt from this special sewer charge because public hospitals were exempt from taxation.

Section 1 of the City of Toronto Act gave the municipal council the authority to pass by-laws imposing a special levy on certain buildings where a building permit was issued for the erection or enlargement of a building after March 6, 1962. The levy was imposed to defray the capital costs of additional sanitary or storm sewer or water supply capacity "which, in the opinion of the Council, would not otherwise be required". The special levy was over and above all other rates and charges and was intended "to pay for all or part of the cost of providing the additional capacity". Section 1(2) of the City of Toronto Act provided that the proceeds of the charges authorized by s. 1(1) could be used only for the purpose of paying for the identified increased capital costs. Section 1(3) gave the municipality authority to collect special levy as taxes if it remained unpaid.

The City of Toronto's by-law passed under the authority of the City of Toronto Act imposed a 20 cent per square foot of gross floor area special levy on the erection or enlargement of structures to which the special levy was applicable. The by-law provided a 3,300-square-foot deductible for purposes of calculating the applicable gross floor area. Mount Sinai, a public hospital, claimed to be exempt from the special levy on the basis of s. 3(7) of the Assessment Act, R.S.O. 1970, c. 32 ("Assessment Act"), which the hospital contended exempted it from taxation.

There were two issues in Mount Sinai. Was the special levy a tax and if it was did the Assessment Act taxation exemption apply to the hospital? A Weekly Court judge accepted that the special sewer levy was taxation, but did not accept the hospital's submission that it was entitled to the benefit of the Assessment Act exemption from taxation. Thus, he dismissed the application. The hospital's appeal to this court was dismissed. However, on the hospital's appeal to the Supreme Court of Canada, the appeal was allowed. The majority concluded that the special levy was a tax and that the hospital was entitled to the benefit of the Assessment Act exemption from taxation. Hall J. put it this way at p. 546:

> Section 3(7) of The Assessment Act is clear and unambiguous. Under it the hospital is exempt from taxation. The special sewer tax or levy here is a tax.

(Emphasis added)

In my view, although Mount Sinai had nothing to do with what we now know as a DC, the special sewer levy in issue in that case can be equated to DCs by analogy. The sewer levy was imposed on the assumption that certain kinds of development (the erection or enlargement of buildings) would necessitate sewer and water-related growth-related capital costs. The payment of the levy, like DCs, was triggered by the issuance of a building permit. The levy had to be paid in a lump sum and if not paid could be collected as taxes. Similar provisions appear in the DCA. The relevant statute and by-law required the special levy funds to be used for the purpose for which they were collected. There are stark similarities throughout to what we now know as a DC. Thus, it is my view that Mount Sinai supports my conclusion that DCs are taxes.

The appellant's argument that DCs are not taxes because the funds collected are used to offset specified growth-related net capital costs was also considered by the Privy Council in British Columbia (Attorney General) v. Esquimalt & Nanaimo Railway Co., [1950] A.C. 87. The Privy Council stated, at pp. 121-22:

> The legislature has thus thought it proper to divide the expense of what is a public service of the greatest importance to the province as a whole between the general body of taxpayers and those individuals who have a special interest in having their property protected. The levy has what are, undoubtedly, characteristics of taxation, in that it is imposed compulsorily by the State and is recoverable at the suit of the Crown. It is suggested, however, that there are two circumstances which are sufficient to turn the levy into what is called a "service charge". They are, first, that the levy is on a defined class of interested individuals and, secondly, that the fund raised does not fall into the general mass of the proceeds of taxation but is applicable for a special and limited purpose. Neither of these considerations appears to their Lordships to have the weight which it is desired to attach to them. The fund is made up partly of the levy and partly by contributions from the taxes paid by the general body of taxpayers. This is no doubt a reasonable apportionment of the burden, for to impose the cost of services which are of general interest to the community as well as a particular interest to a class of individual exclusively on one or the other might well have seemed oppressive. The fact that in the circumstances the persons particularly interested are singled out and charged with a special contribution appears to their Lordships to be a natural arrangement. Nor is the fact that the levy is applicable for a special purpose of any real significance. Imposts of that character are common methods of taxation -- taxation for the road fund in this country was a well-known example. The objects of the legislature in adopting such a form of tax may be various. But if it finds it convenient to do so the impost, if in other respects it has the character of a tax, does not thereby change its character.

(Emphasis added)

In my opinion, the fact that DCs generally, or the hydro component of the DC, must be used for a particular specified purpose does not support the conclusion that the Ottawa DC, or its hydro component, is not a tax.

This brings me to the Supreme Court of Canada's decision in Ontario Home Builders', supra. EDCs, provided for in Part III of the DCA, were in issue in that case. Whether EDCs were, or were not, taxes was clearly in issue before the Divisional Court, this court, and the Supreme Court of Canada. Throughout, Ontario Home Builders' contended that EDCs were indirect taxes and thus unconstitutional. The competing position was that EDCs were regulatory charges, not taxes and alternatively, if EDCs were taxes, they were direct taxes and, therefore, constitutional.

In Ontario Home Builders', the Supreme Court of Canada determined that EDCs were taxes. The court was divided on the issue whether the EDC was a direct (per La Forest J.) or an indirect tax (per Iacobucci J.). The majority concluded that EDCs were indirect taxes, but nonetheless constitutionally justified because they were a novel form of taxation ancillary to a valid provincial regulatory scheme; the minority concluded that the EDCs were direct taxes and thus constitutional.

In his annotation to the Supreme Court of Canada's decision in Ontario Home Builders' (reported (1996), 35 M.P.L.R. (2d) 1)), John Mascarin commented on the majority and minority judgments in Ontario Home Builders' and concluded [at p. 5]:

> The decision, which was anxiously awaited by the municipal sector, also means that municipal development charges, which are authorized under Part I of the Development Charges Act, cannot be constitutionally challenged. It appears clear that the reasoning of both the majority and minority decisions of the court with respect to the issues of direct/indirect taxation, and whether the charges are imposed pursuant to a provincial regulatory scheme, would be equally applicable, if not more so, to municipal development charges.

(Emphasis added)

In my opinion, EDCs are similar to DCs in a very substantial way. EDCs are taxes imposed to defray growth-related net capital costs of development in respect of schools. DCs are imposed to defray the growth-related net capital costs with respect to the particular service areas set out in the municipality's DCB. There is a distinct parallel between EDCs and DCs in the definition, the triggering development events, the process of implementing, the calculation, the collection, the identification of who pays, and the statutory controls on the spending of funds. In particular, EDCs must be deposited in a separate reserve fund and used only for growth-related capital costs in respect of schools. The hydro component of the City of Ottawa DC and the City's component must also be deposited in separate reserve funds. I can find no rational basis upon which to conclude that EDCs are taxes, as unanimously held by the Supreme Court of Canada in Ontario Home
Builders', but DCs are not. The fact that the analysis in Ontario Home Builders' was undertaken in a constitutional context does not, in my view, dilute the force of the Supreme Court of Canada's conclusion that EDCs are taxes.

For these reasons, I think that the City of Ottawa DC, including that part of it allocated to Ottawa Hydro, is a tax. Although I do not think that the Ottawa Hydro component of the DC should be separately analyzed, if that approach is required, I think that it too is a tax. In my opinion, the DC is a tax on development. [See Note 1 at end of document.]

I will now consider whether the Cancer Act taxation exemption applies.

Does s. 16 of the Cancer Act Exempt the Cancer Foundation from Paying the City of Ottawa Development Charge?

Section 16 of the Cancer Act provides that:

> 16. The real and personal property, business and income of the Foundation is not subject to taxation for municipal or provincial purposes.

Section 3(6) of the DCA provides:

> 3(6) No land, except land owned by and used for the purposes of a board as defined in subsection 30(6) or municipality, is exempt from a development charge under a by-law passed under subsection (1) by reason only that it is exempt from taxation under section 3 of the Assessment Act.

Section 49 of the DCA provides:

> 49. In the event of a conflict between this Act and any other general or specific Act, this Act prevails.

The Cancer Foundation argues, and I agree, that s. 3(6) of the DCA and s. 16 of the Cancer Act are not inconsistent. Section 3(6) contemplates exemptions from development charges other than under the Assessment Act. The words "by reason only" in s. 3(6) of the DCA support this conclusion. Thus, s. 3 of the Assessment Act does not on its own exempt land from a development charge. The Cancer Foundation does not claim its exemption from taxation through s. 3 of the Assessment Act. Section 3(6) of the DCA leaves it open to find an exemption on some other basis. The other basis in the circumstances of this case is the specific exemption established in s. 16 of the Cancer Act. As Cunningham J. put it in Collège d'arts appliqués et de technologie La Cité collégiale v. Ottawa (City) (1994),

20 O.R. (3d) 541 at p. 546, 119 D.L.R. (4th) 566 (Gen. Div.), "[h]owever, by the wording of s. 3(6) it is left open to find an exemption for other reasons and of course that other reason in the present case is s. 11 of the Interpretation Act." I agree. I would thus not give effect to this ground of appeal. In my view, s. 16 of the Cancer Act exempts the Cancer Foundation from paying the City of Ottawa DC, including its hydro component.

For these reasons, I would dismiss the appeal with costs.

Appeal dismissed.

Notes

Re **Russell and Banbury** et al

[1955] O.R. 653-667

ONTARIO
WILSON J.
8th JUNE 1955.

AN APPLICATION for an order that requisitions on title had been satisfactorily answered.

21st April 1955. The application was heard by WILSON J. in chambers at Toronto.

H.F. Parkinson, Q.C., and W.J. Anderson, for the vendor, applicant.

H.E. Harris, Q.C., for the purchasers.

R.B. Robinson, for the Minister of Highways.

8th June 1955. WILSON J.:-- This is an application by a vendor for an order declaring that the purchaser's requisitions upon title have been satisfactorily answered. It was returnable on 1st April 1955, at the same time as another motion in the same matter for an order under Rule 602 requiring notice of the application herein to be given to Her Majesty the Queen in the right of the Province of Ontario, as represented by the Minister of Highways. On that date Mr. Justice Danis made an order requiring that notice of the application be served as asked on the latter motion. Such service was made and the main motion was heard on 22nd April 1955 in the presence of counsel for the Crown, the vendor and the purchasers. Owing to the complicated nature of the requisitions and answers, it will be more convenient to refer first to the facts.

The requisitions are made in respect of a property known as no. 350 Martindale Road in the township of Grantham, in the county of Lincoln. It is residential and substantial in size, 187 feet frontage on the east side of, but not abutting, Martindale Road, and an average depth of 500 feet to the old Welland Canal where the Canadian Henley Regatta is held each year. Along the south boundary lies a rectangular parcel of land owned by the Crown for the Department of Highways but not part of a highway. South of and abutting this latter parcel is the Queen Elizabeth Way, a controlled access highway. Roughly, therefore, the land in question is situated at the north-east corner of the intersection of Martindale Road and the Queen Elizabeth Way. The former crosses the latter by means of a bridge.

By a written contract dated 13th December 1954 the purchasers have agreed to buy the property in question "provided the title is good and free from encumbrance". There are other exceptions which are not material.

Upon it stand a substantial house and separate garage erected in 1949 without the permission of The Minister of Highways required by the combined provisions of The Highway Improvement Act, R.S.O. 1937, c. 56, s. 79a(2) (as enacted by 1945, c.9, s.8) and the Regulations made thereunder. The portions relevant to the requisitions then read:

"The Lieutenant-Governor in Council may make regulations relating to controlled access highways,--

"(c) prohibiting or regulating the erection and alteration of buildings or other structures upon or adjacent to highways intersecting or running into controlled access highways for a distance of six hundred feet from the limit of any controlled access highways."

The Regulations, published as O. Reg. 40/45, provided.

"12. No person shall erect a building or other structure upon or adjacent to a highway intersecting or running into a controlled access highway for a distance of 600 feet from the limit of any controlled access highway without a building permit therefor.

"13. -- (1) The Minister may in his discretion issue building permits in such form as he may prescribe, provided the nature and purpose of the building or other structure thereby permitted is stated therein ...

"14. A building or other structure in respect of which a building permit has been issued shall not be altered in its nature or purpose without a building permit in respect of such alteration."

Between May and September 1949 one Percy A. Gilligan, the then owner, erected a substantial house and garage upon the property in question without obtaining the necessary permit under the statute or regulations.

On 24th March 1950, s. 79a(2) of The Highway Improvement Act was repealed by The Highway Improvement Amendment Act, c. 24,
s. 7, and a new s. 79b was enacted, which is now replaced by s. 93 of R.S.O. 1950, c. 166. This section, as amended by 1951, c. 33, s. 5, and 1954, c. 34, s. 3, provides in subs. 1:

"Notwithstanding any general or special Act, regulation, by-law or other authority, no person shall, except under a permit therefor from the Minister,

"(a) place, erect or alter any building, structure or fence, or any part thereof, or place any tree, shrub or hedge, or any part thereof, upon or within 150 feet of any limit of a controlled-access highway, or upon or within 600 feet of any limit of a highway that intersects or runs into a controlled-access highway for a distance of 600 feet from any limit of the controlled-access highway ..."

By subs. 3 the Minister of Highways, in his discretion, may give notice to the owner or occupant of any land requiring him "to remove or alter any building, structure, fence, tree, shrub, hedge ... erected or maintained after the 24th day of March, 1950, or to close up any private road, entrance-way or gate constructed or maintained after that date that does not comply with subsection 1 or with any permit issued under this section with respect thereto."

Subsection 4 reads: "The Minister, in his discretion, may give notice to the owner or occupant of any land requiring him to remove or alter any building, structure, fence, tree, shrub, hedge ... placed or erected before the 24th day of March, 1950, or to close up any private road, entrance-way or gate constructed before that date that would not comply with subsection 1 if it had been so placed, erected or constructed after that date." Subsection 6 empowers the Minister to enter upon lands and to remove the buildings, etc., upon default for 30 days in complying with the Minister's direction.

Subsection 7 authorizes him, in his discretion, to issue permits under this section in such form for such term and upon payment of such fee as he may deem proper, and in his discretion he may cancel any permit.

Subsection 9 provides penalties for failure to comply with the provisions of subs. 1; the continuance of the condition constituting an offence for each week after conviction therefor constitutes a new offence.

Subsection 9a provides for the determination by arbitration under The Public Works Act, R.S.O. 1950, c. 323, of compensation to be paid for lands expropriated or injuriously affected by the exercise of powers under subs. 4.

Subsection 9c reads: "No compensation shall be allowed under subsection 9a if that which was removed, altered or closed up did not comply with The Highway Improvement Act and the regulations thereunder on the 23rd day of March, 1950."

In December 1952 the present entrance-way to the house and garage was built, also without a permit, and it has been used as such since that date. It crosses a 20-foot wide "highway", hereinafter referred to, and the right-of-way of the Niagara, St. Catharines and Toronto Railway which lie between the lands in question and Martindale Road.

By deed dated 14th December 1954 and registered on 5th January 1955 Percy A. Gilligan conveyed the lands in question to James Russell, the vendor herein. On 13th December 1954 Russell agreed to sell the lands to the purchasers. On 12th January 1955 in response to a letter from the vendor's solicitor, the contents of which were not disclosed on the application, H. Barry, Supervisor of the Department of Highways, Signs and Building Permits Branch, wrote to that solicitor enclosing two building-permits also dated 12th

January 1955, and each bearing the words "Permit No. 1599", one "Issued in pursuance of The Highway Improvement Act, R.S.O. 1937, Chapter 56" -- which had been repealed -- and the other simply called "Building Permit" without reference to statutory or other authority. They appear to be inaccurately made out in a number of respects but the main inaccuracy is that they state that this property is on the north side of the Queen Elizabeth Way, which it is not. It is clear, however, that they are intended to refer to the house referred to above. There is no mention of a separate garage. No permit of any kind has ever been issued for it.

The first requisition and answers are as follows:

"1. We understand that the existing house and garage were erected upon the lands in question during the summer of 1949, that the house is within 150 feet of the northerly limit of the Queen Elizabeth Way, a controlled-access highway, and that the garage is within 600 feet of the said northerly limit and within 600 feet of the easterly limit of Martindale Road, and that the then owner of the said lands did not obtain a permit from the Minister of Highways of Ontario for the erection of the said buildings as required by The Highway Improvement Act, R.S.O. 1937, Chapter 56, and regulations thereunder.

"(a) Required, production of an irrevocable permit from the Minister or Deputy Minister of Highways of Ontario authorizing the owner or owners from time to time of the said lands to maintain the said buildings on the said lands, and proof that the said Minister or Deputy Minister is authorized by The Highway Improvement Act, R.S.O. 1950, Chapter 166, and the regulations thereunder to issue such a permit.

"(b) Required, proof that in the event of the production of the permit mentioned in the above requisition, the Minister of Highways cannot require the said buildings to be removed from the said lands under the authority of The Highway Improvement Act, Section 93, subsections 4 and 6.

"(c) Required, proof that The Highway Improvement Act, section 93, subsections 9a and 9c does not prevent the payment of compensation to the owner of the said lands in the event that the removal of the said buildings is required under the provisions of The Highway Improvement Act, section 93 subsections 4 and 6."

ANSWERS:

"1. (a) (b) and (c)

"(i) The sketch of survey dated 2nd March 1955 prepared by Douglas G. Ure, O.L.S. filed, shows that the residence and garage are not within 150 feet of the Controlled Access Highway, known as the Queen Elizabeth Way, as laid down in Regulation 134, 1 C.R.O. Page 609. The survey indicates a distance of approximately 233' from the line of pavement to the South Limit of the lands sold and a distance of 45'6" from there to the nearest point of the residence. The Controlled Access Highway at the location is declared to be 140' wide with centre line described and laid down on plans filed at Toronto. The Highway Department plans indicate a width between North and South Limits of the pavement of about 70'. There would seem to be approximately 240' between the residence and the nearest limit of the Controlled Access Highway.

"(ii) The material filed upon the Motion shows that there were issued in favour of Percy A. Gilligan, the vendor's predecessor in title, two documents, apparently building permits, each dated 12th January 1955. One document purports to be pursuant to The Highway Improvement Act (1937) Chapter 56 and amendments thereto and Regulations thereunder and the other purports to be pursuant to The Highway Improvement Act (1950) Chapter 166 and amendments. The residence and garage were erected and completed during the months of May to September in the year 1949, prior to the enactment of the 1950 Statute which came into effect as of the 24th March 1950. It is submitted that such permits cover the erection of the garage which is appurtenant to the residence. In consequence the buildings in question do not conflict with the provisions of Section 93(1) (a) of the present Statute. It is submitted that the issue of the two permits by the Minister has the same effect as if the residence and garage were built after the new Act and with a permit therefor and that it is inconceivable that the Minister would purport to give notice in respect thereof under Section 93(4). It is to be observed that any building, erected with or without a permit, prior to the new Act would be subject

to the right of the Minister to give the notice set out in Section 93(4).

"(iii) It is to be noted that the former Statute gave power to make regulations 'prohibiting or regulating the erection and alteration of buildings' and that Regulation 12 merely dealt with the erection of buildings without permits. No part of the old Statute or Regulations has anything to say concerning maintenance of any building after erection. It is submitted therefore that Section 93(9c) would not apply to the building in question because the residence and garage were completed and in occupation on the 23rd day of March 1950.

"(iv) It is also submitted that Martindale Road crossing the Controlled Access Highway by a bridge, is not a highway intersecting or running into the Queen Elizabeth Way within the meaning of Section 12 of the Regulations under the former Statute."

Upon these statements the purchasers required the production of a permit to build as required by the statute and Regulations first above referred to and proof that the Minister or Deputy Minister of Highways had power to issue such permit. It was agreed upon the hearing of the motion that neither the statute nor the Regulations relating to the Queen Elizabeth Way applied in this instance because the lands do not adjoin the Queen Elizabeth Way. They are separated from it by the lands owned by the Crown, as already stated. The answer to this portion of the requisition is therefore satisfactory.

The motion was also argued with respect to the application of the statute and Regulations to "structures upon or adjacent to highways intersecting or running into controlled access highways". In respect of this branch of the requisition as argued and the answers, I find that the requisition was not satisfactorily answered because neither the Minister nor the Deputy Minister nor any official of the Department of Highways had power to issue the permits and they are null and void for reasons which I shall now state. I find that there was a clear breach by the then owner and builder of the statute and Regulations in force at the time the house and garage were erected in 1949 in failing to obtain a permit from the Minister. The statute, in s. 79a, referred, not to a residence but to "buildings" which might comprise a house and garage. The Regulations (nos. 12, 13, 14) refer to buildings. The singular word "building" cannot be construed to mean more than a single building. No reason and no extenuating circumstances have been given for this breach, and it will be noted that both the statute and the Regulations had been in force and published since 1945 and must be taken to have been well known. It was not until after the purchasers had agreed to buy the lands in question that the matter of the necessity for a permit was raised, probably by the requisitions on title. Then the two permits referred to were issued on 12th January 1955, more than five years after the provisions of the statute and Regulations had been broken.

The general principle governing the issue of permits ex post facto is laid down in Howell v. Falmouth Boat Construction Co. Ld., [1951] A.C. 837 at 847, [1951] 2 All E.R. 278, where Lord Normand said: "The next question is whether a licence under the Order can be retrospective. This, again, is a question of construction. Counsel for the respondents naturally took the point that retrospective authority is a familiar conception in our law. That is true and not unimportant for this case. But it needs more than this to justify the construing of a licence to carry on an activity otherwise prohibited by statutory order as including a licence with retrospective effect. It would be a dangerous power to place in the hands of Ministers and their subordinate officials to allow them, whenever they had power to license, to grant the licence ex post facto; and a statutory power to license should not be construed as a power to authorize or ratify what has been done unless the special terms of the statutory provisions clearly warrant the construction."

The Highway Improvement Act, both former and present, must now be considered as required by the principle just quoted. I find the statutes contemplated prohibition against the very acts which were done here.

The former statute, by s. 79a(2)(c), gave the Lieutenant-Governor in Council power to make regulations "prohibiting or regulating the erection and alteration of buildings or other structures ..." and by subs. 3 of the same section provided penalties for violation of "any of the provisions ... made under the authority of this section". The present statute not

only provides in s. 93(9c) that no compensation shall be awarded for buildings removed by the exercise of powers under s. 93(4) or (6) above quoted, but also provides penalties for the violation of any of the provisions of the Regulations made under the authority of s. 79a, the penalty section being s. 79a(3), as enacted by 1945, 9 Geo. VI, C.9, s.8.

But there is still another reason for holding the permits issued to be null and void, namely, the express provisions of s. 93(9c) of the present statute, namely: "No compensation shall be allowed under subsection 9a if that which was removed, altered or closed up did not comply with The Highway Improvement Act and the regulations thereunder on the 23rd day of March, 1950." This language seems to me to be very clear.

Moreover, I doubt the power to issue, in 1955, the permit purporting to have been issued under the statute in force in 1949, because the section authorizing Regulations requiring permits had been repealed. The 1950 statute was a consolidating statute, generally speaking, but some sections of the 1937 statute as amended and in force until 24th March 1950 were repealed. Such was s. 79a, and so also, of course, were the Regulations founded upon it: see The Statutes Consolidation Act, 1949, c. 96, s. 6(2), to be found in R.S.O. 1950, vol. 5, p.257, and schedule A, showing the extent of the repeal, in the same volume at p. 96, and the relevant section as amended by 1945, c. 9, in schedule B, p. 183. The revised statutes of 1950 came into force on 31st December 1950.

However, in the peculiar circumstances of this individual case no permit was required. I return to the requisition. In respect of Martindale Road, it was stated as a fact that the garage was within 600 feet of that highway, a highway intersecting the Queen Elizabeth Way -- a controlled access highway. I note that there is no requisition in respect of the house, which was erected even closer. The motion, however, was argued as if it had been included, and I so treat it. The reference to 600 feet is perhaps inaccurate. The wording of the statute at the date of the erection of both buildings was "adjacent to highways intersecting or running into controlled access highways". It was not until the 1950 statute came into force that the words "upon or within 600 feet" were substituted for the word "adjacent" in a new section, as already stated.

The question then was -- were these lands "adjacent" to the intersecting highway so as to require a permit for the erection of each building, i.e., the house and the garage?

Before answering it, a further statement of fact is necessary. The property did not abut on Martindale Road, a county highway, the property of the Corporation of the County of Lincoln. It was separated from it by the railway right-of-way of the Niagara, St. Catharines and Toronto Railway and by a strip of land 20 feet, more or less, in width across the whole frontage of 187 feet, the southerly end of which strip abutted on the lands owned by the Crown immediately south of the land in question, to which reference has already been made. This long, narrow strip was said upon the argument to be owned by the Crown but not to be a highway. Further research by Crown counsel has disclosed, however, that it is highway land which was acquired to assist in the separation of the grades of Martindale Road and the railway, on the one hand, and the Queen Elizabeth Way, as it is now known, on the other. It is utilized to provide space upon which the embankment to the east of, but adjoining, the railway right-of-way was placed. Although owned by the Crown as a "King's Highway" and therefore a public way, it is not legally part of the Queen Elizabeth Way, a controlled access highway. This statement need not be enlarged upon. It is sufficient to say that it is the result of unusual wording of the orders-in-council leading to the creation of the Queen Elizabeth Way. It was not suggested that it forms part of the railway right-of-way and it can hardly be said, legally, to be part of Martindale Road or to "intersect" the Queen Elizabeth Way.

In my opinion, in these unusual circumstances the word "adjacent" is not sufficiently clear to justify holding that the lands in question were "adjacent" to an intersecting highway so that a permit was required for the erection of the house and garage. The word has been abandoned by outright repeal, as already stated, and in place of it a definite distance of 600 feet has been fixed in the present statute.

Moreover, "adjacent" does not necessarily mean adjoining, but may do so. Its meaning, therefore, is indefinite. It is

impossible to say when lands cease to be adjacent. I am quite well aware that most decisions hold that the word may apply to distances much greater than those which existed here, and generally regard must be had for the purposes of the statute. It may be noted that it is difficult in this case to define the purpose of the statute. On occasion a narrower meaning has been given to the word as indicated in a collection of American cases to be found in 2 Words and Phrases, perm. ed. 1940, under the heading-word "Adjacent" and the sub-headings "adjoining" and "lying near". They only serve this purpose, namely, to indicate that generally speaking the broader meaning is given to the word "adjacent"; the more restricted one is not unknown.

For these reasons, I have come to the conclusion that in these unusual circumstances the lands did not come within the provisions of s. 79a and the Regulations passed thereunder. Consequently, no building-permits were required for the house and for the garage.

As to requisition 1(b), asking for proof that the Minister cannot require buildings to be removed under s. 93(4) and (6) of The Highway Improvement Act, quoted above, if a permit is produced, in so far as this relates to any building, structure, fence, etc., placed or erected before the 24th March 1950, it is my opinion that no limitation can be placed upon the future use of this power. I think he may use it at any time in his discretion, as the statute provides. In my opinion there has been no answer to this requisition.

Requisition 1(c) asks for proof that subss. 9a and 9c of s. 93 of The Highway Improvement Act do not prevent the payment of
compensation if the Minister exercises his powers under subss. 4 and 6. I do not think this requisition is answered in the answers given in (i), (ii) and (iii). Since no permit was required in this unusual case, this requisition need not be answered.

Requisition 2 and the answers thereto are as follows:

"The only means of access to the said lands is a driveway leading from the Martindale Road across lands owned by the Niagara, St. Catharines and Toronto Railway Company and across lands owned by Her Majesty the Queen in the right of the Minister of Highways of Ontario, which said driveway enters the said lands through an entrance at the northwest corner thereof 187 feet northerly from the northerly limit of the Queen Elizabeth Way. We understand that this driveway and entrance has been in use since the summer of 1949 without a permit from the Minister of Highways as required by The Highway Improvement Act, R.S.O. 1937, Chapter 56, and regulations thereunder, or that if there was such a permit it authorized the maintenance of an entrance not less than 300 feet northerly from the said northerly limit of the Queen Elizabeth Way. In order to provide adequate and permanent means of access to the said lands we require:

"(a) An irrevocable permit from the Minister or Deputy Minister of Highways authorizing the owner or owners from time to time of the said lands to maintain the said entrance in its present location, and proof that the said Minister or Deputy Minister is authorized by The Highway Improvement Act, R.S.O. 1950, Chapter 166, and regulations thereunder to issue such a permit.

"(b) A permanent right-of-way from Her Majesty the Queen represented by the Minister of Highways of Ontario to the owner or owners from time to time of the said lands across the lands of the Department of Highways as shown on Highway Plans 167 and 192 at the present location of the said driveway.

"(c) A permanent right-of-way from the Niagara, St. Catharines and Toronto Railway Company to the owner or owners from time to time of the said lands across the lands of the Niagara, St. Catharines and Toronto Railway Company at the present location of the said driveway."

ANSWERS:

"2. (a) and (b)

"The lands on Highway Plans 167 and 192 are lands acquired by the Minister for highway purposes and no right of way in respect thereof is needed. The letter dated 12th January 1955 from the Department of Highways to the vendor's solicitor states that no entrance permit in respect of the entrance shown

upon the survey is required and it is submitted that this letter constitutes the assent of the Minister to the use of the driveway for all purposes. The letter of the Department of Highways to the vendor's predecessor in title dated 10th May 1949 refers to an entranceway to the north of the property sold and this entrance was used as an entrance for the residence and garage from the time it was opened in the month of May, 1949 until the entranceway shown on the survey was opened and placed in use in the month of December, 1952. The present entranceway having been established and placed in use since the new Act, no permit is necessary and the Minister may not give notice in respect thereof under Section 93(4) of the new Act. It is also submitted that the land sold does not adjoin the Controlled Access Highway within the meaning of sections 7 and 8 of the old Regulations.

"2. (c)

"(i) The contract does not purport to include a permanent right of way across the lands of the Niagara, St. Catharines and Toronto Railway Company. The vendor did not agree to convey any such permanent right of way. Such right of way was not part of that which was sold and the requisition is not a matter of title within the meaning of the contract.

"(ii) It was patent upon an inspection of the property that the railway existed between Martindale Road and the lands sold and that the crossing was a 'Private Crossing' and that 'persons using this crossing do so at their own risk' and no stipulation in respect of such crossing was contained in the offer.

"(iii) The physical crossings over the railway land are pursuant to licenses granted by the Railway Company from time to time to owners of adjoining property. It is the policy of the Railway Company to renew such licences from year to year and it is submitted that the Railway Company will grant such license to the purchaser and will renew such license for the purchaser and his successors for such length of time as may be required.

"(iv) The property sold does not abut the railway land but adjoins Highway land both to the West and to the South."

In my opinion the answers to (a) and (b) answer requisition (a) in so far as a permit to maintain an entrance is concerned, and are subject to what I shall have to say in commenting upon requisition (b) which follows:

Requisition (b) -- The two strips of land which, together, have an approximate width of 20 feet and lie between the lands in question and the easterly boundary of the railway right-of-way were acquired by the Crown by the deposit of Plans D167 and D192. They comprise a highway and for purposes of this motion all I need say is that as such the owner of an abutting property has the right to use them for the highway purpose of crossing them to gain access eventually to Martindale Road. No permission is required from the Crown. Upon argument and upon the then assumption that they were Crown lands, but not a highway, and that permission would be required to cross them, Crown counsel, on behalf of the Crown, consented that the present "crossing" of its property should continue to be used as such as long as the property in question is used for farm and/or residential pruposes.

He pointed out that s. 93(9c), supra, only relates to the exercise of powers under s. 93(4), supra. If, in future, the Crown expropriates the lands in question for future development of a highway, these sections will not apply.

The answer to requisition 2(b) is, therefore, nihil ad rem, but this is of no consequence because the Crown says these lands are part of "The King's Highway".

The crossing of the lands of the Niagara, St. Catharines and Toronto Railway, while also a part of the access to the lands in question, is not, in my opinion, here a matter of title. The railway is declared to be for the general advantage of Canada: 50-51 Vict. (Can.), c. 60, and as such comes within the ambit of The Railway Act, R.S.C. 1952, c. 234. The Board of Transport Commissioners has power, under ss. 260 and 276, to make orders giving rights to cross railways and, no doubt, would make such an order in this case if it became necessary to do so. In practice the railway grants an annual licence to the registered owner of the lands and has done so in this instance to Gilligan for a nominal fee. By their express terms these

licences are not assignable.

I think the purchasers were put upon notice to inquire when they saw, as they must have seen, that the railway lands were fenced, as I take it from the wording of the licence they were, at least on the east side of the right-of-way, with a gate in that fence at the site of the crossing.

The answer to this portion of the requisition is satisfactory.

Requisition 3 and the answers thereto are as follows:

"If any of the permits required in the foregoing requisitions have been issued to the vendor or his predecessors in title, required:--

"(a) Production on closing of all assignments necessary to vest such permits and the rights arising thereunder in the name of the purchaser.

"(b) Production on closing of all necessary consents of the Minister of Highways to all the foregoing assignments.

"(c) Proof that such permits are valid and subsisting, irrevocable permits, enuring to the benefit of the purchaser and his successors on title, and in accordance with the requirements of the foregoing requisitions."

ANSWERS:

"3. (a) (b) and (c)

"In so far as the 'building permit' purports to be operative under the old Act and Regulations, no assignment is necessary because the Regulations clearly require the building permit only in connection with the erection of the building. The erection of the building was completed in 1949 and the buildings themselves have been in occupation ever since. The old Act and Regulations did not deal in any way with the maintenance of buildings after erection. The same interpretation is applicable to the new Statute which provides that the 'permit' is in respect of the placing, erection or alteration of the building and not in respect of the maintenance thereof."

The comments I have made upon the earlier requisitions and answers make unnecessary a comment upon those numbered 3.

An order will therefore go declaring

(a) that the answer to requisition 1(a) is satisfactory in so far as it relates to the Queen Elizabeth Way, but is unsatisfactory in so far as it relates to Martindale Road; (b) that the answers to requisitions 1(b) and 1(c) are unsatisfactory;

(c) that the answers to requisitions 2(a) and 2(b) are unsatisfactory;

(d) that the answer to requisition 2(c) if satisfactory.

(e) No ruling is made in the circumstances with respect to requisition 3 and answer 3.

(f) No building-permit was necessary under s. 79a and the Regulations passed thereunder.

The vendor and purchasers will each pay their own costs. The vendor will pay the costs of the Crown.

Order accordingly.

Solicitor for the vendor, applicant: T.R. BeGora, St. Catharines.

Solicitors for the purchasers: Fleming, Harris, Kerwin & Barr, St. Catharines.

Toronto (City) Chief Building Official v. Andriano

Between
Pamela Coburn, Chief Building Official for the City of Toronto and The Corporation of the City of Toronto, applicants, and Jacques Andriano, respondent

[1998] O.J. No. 3933
DRS 98-16623
Court File No. 97-CV-128925

Ontario Court of Justice (General Division)
Pitt J.
Heard: August 27, 1998.
Judgment: September 30, 1998.

Counsel:
Andrew Weretelnyk, for the applicants.
Patrick Clement, for the respondent.

[para1] The applicant seeks the following relief:

a) an Order abridging the time for service of this Application, for substituted service or dispensing with service as the case may be, upon the Respondents;

b) an Order requiring the Respondent, his successors and assigns to remove a three storey and basement addition measuring approximately 23 feet 9 3/4 inches in length and 17 feet 9 1/2 inches in width to the rear of the building, together with an uncovered platform and basement entrance, at premises in the City of Toronto municipally known as 130 Springhurst Avenue, constructed pursuant to Permit No. 378-912 issued on April 29, 1996 and revoked on June 27, 1997 within 30 days of the date of the Order;

c) an Order requiring the Respondent, his successors and assigns to remove all interior alterations including plumbing and widened part of the third floor dormer at the front of the building at 130 Springhurst Avenue, constructed pursuant to Permit No. 378-912 issued on April 29, 1996 and revoked on June 27, 1997, and to restore the building to a single family dwelling within 30 days of the date of the Order;

d) an Order restraining the Respondent, his servants, agents, successors and assigns from using or permitting the use of the premises municipally known as 130 Springhurst Avenue as other than a single family dwelling;

e) an Order requiring the Respondent, his successors and assigns to complete all the repair work as set out in the Order of the Inspector dated April 4, 1997, to bring the premises municipally known as 130 Springhurst Avenue into compliance with Chapter 210 of the Toronto Municipal Code within 30 days of the date of the Order;

f) an Order permitting the Applicants, their servants or agents to remove the three storey and basement rear addition, together with uncovered platform and basement entrance, interior alterations and widened part of the third floor dormer at the front, constructed pursuant to revoke building Permit No. 378-912 at premises in the City of Toronto municipally known as 130 Springhurst Avenue including plumbing work, and to restore the premises to a single family dwelling, and to carry out all work listed in the Inspector's order dated April 4, 1997 to bring the premises into compliance with Chapter 210 of the Toronto Municipal Code in the event that the Respondent, his successors or assigns fail to comply with the relief requested in subparagraphs (b) and (c);

g) an Order requiring the Sheriff for Metropolitan Toronto and the Metropolitan Toronto Police to assist the Applicants in carrying out the provisions of the Order sought in subparagraph (f) above;

h) an Order permitting the Clerk for The Corporation of the City of Toronto to add to the Collector's Roll and to collect the same manner and with the same priorities as municipal realty taxes, the costs of removing the unauthorized construction and restoring the building at premises in the City of Toronto municipally known as 130 Springhurst Avenue to a single family dwelling, and completing the repair work to bring the premises into compliance with Chapter 210 of the Toronto Municipal Code and the Sheriff's fees;

i) the costs o this Application fixed at $1,500.00;

j) such further and other relief as this Honourable Court deems just.

[para2] The grounds for the relief sought are:

a) The respondent is the owner of premises in the City of Toronto municipally known as 130 Springhurst Avenue.

b) On April 29, 1996, a building permit was issued to the Respondent for a rear three storey and basement addition, together with uncovered platform and basement entrance, for interior alternations, and the widening of a third floor dormer at the front, to covert the existing dwelling to two dwelling units.

c) Inspections in March, 1997, disclosed that the building at 130 Springhurst Avenue was being occupied as a rooming house with four roomers renting separate rooms and sharing the sanitary and culinary facilities.

d) On June 27, 1997, the building permit was revoked by the Chief building Official on the basis that it had been obtained as a result of false information being provided to the Chief building Official at the time of the application.

e) 130 Springhurst Avenue is located in an area within which use of the building for the purpose of a rooming house is prohibited by the City of Toronto Zoning by-law. To date, the Respondent has not discontinued the use of the building at 130 Springhurst Avenue as a rooming house, nor has he reduced the occupancy to a single family dwelling.

f) Inspection of 130 Springhurst Avenue on March 10, 1997 disclosed that it did not conform to the housing standards set out in Chapter 210 of the Toronto Municipal Code. An Order was issued to the Respondent on April 4, 1997, requiring 63 repairs to be completed within 30 days of the date of receipt of the Order. The Order was received by the Respondent on or about April 14, 1997. To date, the Respondent has not completed the repairs required by the Order.

g) Section 38 of the Building Code Act, 1992, c. 33.

i) Rules 3.02(1) and 16 and 14.05(2) of the Rules of Civil Procedure.

[para3] The respondent does not deny any of the facts as set out in the application. He however seeks a dismissal of the application and "an order requiring the applicant to reissue a building permit in order to permit the respondent to finish the conversion into a two dwelling unit - on the grounds that":

> It is the respondent's intention to reacquire the requisite Work permit in order to finish converting the premises into a two dwelling unit.

[para4] The legal basis of the respondent's claim for relief is, in the language of his counsel's factum:

> The Chief Building Official must issue a permit under subsection (1) unless certain conditions apply.
>
> As long as the respondent occupies these premises as a single family dwelling he is entitled to a reissue of the building permit which was revoked due to the use of these premises as a rooming house.

[para5] Notwithstanding his written submissions, respondent's counsel has argued, as I understand it, that the real issue in the application is whether or not he is entitled to use the premises as a rooming house with four roomers renting separate rooms and perhaps sharing sanitary and cooking facilities. Presumably if the court were to make a finding in his favour such a finding would render inoperable the revocation of the permit.

[para6] I am not called upon to adjudicate on an appeal of the applicant's decision to revoke the permit. Such an appeal has never been taken by the respondent, who evidently feels entitled to invoke his own procedures for dealing with those problems.

[para7] The alterations having been done pursuant to a permit could not have been per se dangerous, and accordingly there is no justification for the applicant's request to have them removed within 30 days. A period of 90 days from the release of these reasons would be a reasonable time for the removal of those alterations referred to in paragraph "b and c" of the relief headings.

[para8] The right sought in paragraph "h" permitting the applicant to add the costs of removing unauthorized construction to the Collector's Roll is to be exercised only if the respondent fails to comply with the court's order.

[para9] In all other respects the application is granted.

Costs

[para10] The parties may make written submission on costs within 20 days of the release of this judgment.

Ontario Municipal Board
W.R.F. Watty and J. Seaborn
October 27, 2000

COUNSEL:
P. Devine and S. Longo, for Minto BYG Inc.
J. Paton, G. Leonard, for City of Toronto.
A. Brown, for Provo Developments Ltd.

DECISION DELIVERED BY W.R.F. WATTY AND J. deP SEABORN AND ORDER OF THE BOARD:--

[para1] Minto BYG Inc. ("Minto") owns two properties at the southwest corner of Bay Street and Yorkville Avenue. These two properties are municipally described as 1252-1260 Bay Street and 61-63 Yorkville Avenue, which together constitute a combined landholding of .186 hectares or 0.459 acres. The properties have a frontage of 55m (180 ft.) along Bay Street and 34m (111 ft.) along Yorkville Avenue, with a westerly flankage along Genoa Street, a short cul-de-sac'd lane leading from Yorkville Avenue southwards to a proposed development at the corner of Bay Street and Cumberland Street identified municipally as 1250 Bay Street. The two subject properties are developed with a seven-storey commercial office building in the one case, and a recently demolished low-rise two-storey commercial building in the other.

[para2] Minto has applied to the City of Toronto ("City") for approvals to permit the redevelopment of both of the subject properties for an integrated eighteen (18) storey, 171 residential condominium building, with street level commercial uses and 110 below grade parking spaces. The applications include an amendment of the City's Official Plan to re-designate the Yorkville Avenue portion of the site from a low density mixed commercial - residential area ("LCR") to high density mixed commercial - residential area "A" "(HCR "A")" on the Bay Street portion of the site, which constitutes approximately two-thirds of the combined area. The Official Plan places a maximum density (developable floor area) of three times site area and the height range of three to five stories on the Yorkville Avenue portion. The Official Plan in the HCR "A" designation establishes a maximum developable floor area at six times the applicable site area. The Official Plan Amendment proposes an overall density for development at 9.9 times site area and 18 storeys.

[para3] In addition, Minto has applied for an amendment to the City's Zoning By-law 438-86 to implement the proposed

Official Plan Amendment. The portion of the amendment area, described as 1252-1260 Bay Street, is presently zoned by way of a mixing formula for maximum development density applicable to commercial (C), residential (R) and both uses in combination (T). For this property, the zoning is commercial - residential (CR), T6.0 C4.5 R6.0 indicating the maximum floor area permissible as a factor applied to site area. In the case of 61-63 Yorkville Road, the applicable zoning (use and density of use) is CR T3.0 C2.5 R3.0. In the two zones, development is subject to height constraints of 46m and 18m respectively. The zoning by-law amendment would permit a combined development density at 9.9 times lot area to a height of 60.45m.

[para4] The Board also has before it a proposed site plan appealed by the applicant for determination of details and for settlement of required provisions of any site plan agreement. At the conclusion of the hearing of the evidence and submissions, both parties invited the Board not to address the site plan matters at this time, but that should the Board allow the appeals, the parties be instructed to enter into discussions for finalization of the Section 41 appeals with the Board seizing itself of this matter in the event of failure to agree.

[para5] The appeals come forward as a result of the refusal of the municipal council to enact the requested by-laws and to approve the necessary plans or drawings. Both parties through their various witnesses and by way of submissions are agreed that the proposed development, its location, orientation, design, servicing and environmental and traffic/parking impacts present no unacceptable or adverse implications, but rather in terms of its physical and structural characteristics the project is acceptable. Provo Developments Ltd. did not call any evidence, examine any witnesses or make any submissions to the Board.

[para6] The only issues that remain outstanding are whether bonusing provisions should form part of the amendments that are before the Board, and if so, in what amount. It is the position of the City that the Board should require Minto to provide appropriate public benefits pursuant to Section 37 of the Planning Act in exchange for the increased height and density sought. Without such a requirement, the application fails to meet the complete test of good planning in so far as it does not comply with the Official Plan. Minto argues that the application of Section 37 provisions to the subject development should not result in any further amenities other than those which have been proposed or which are valid conditions of site plan approval. The applicability of Section 37 of the Planning Act to the subject development proposal is the sole issue in contention at this hearing.

[para7] The Board recognizes that Section 37 is an important tool for the City as it allows significant funds to be provided by a developer in return for approvals which exceed existing zoning and by-law requirements. The City appears in opposition to the application on the basis that Minto ought to be required to make financial contributions to significant and important City initiatives. Section 37 provides a mechanism to supplement social programs, among others, that are needed. The City's efforts in this regard are commendable given that all of the contributions made to date have been the product of negotiation, without appeal to the Board, making this application novel.

Location and Context

[para8] The development proposal is located in an area of the City undergoing redevelopment through intensification. As described in the evidence of Mr. Peter Walker, the planning witness called by Minto, the development is located one block north of Bloor Street, a major shopping and business artery in the City which at its intersection with Bay Street, defines a major high-intensity road complimented by two major road systems. The project is close to both east-west and north-south surface and subway and transit lines and other community and city facilities and amenities. Bay Street is the eastern limit of the Yorkville district, a high-end commercial and retail area focussed on Yorkville Avenue which extends west to Avenue Road, its western extremity. While along Yorkville Avenue itself redevelopment and improvements have been essentially modifications and modernizations within the framework of the predominantly two to four storey

converted residences, at the east and west extremities and along the Bloor Street frontage development which abuts the district to the south, redevelopment has tended to maximize high density possibilities.

[para9] Mr. Walker described a number of high rise commercial offices with ground floor retail developments located on the east side of Bay Street and identified a proposal for a twenty-two storey (82m) mixed use retail residential building also along the east side of Bay Street, one block further south. Immediately to the south a recently approved construction-in-progress for an eighteen storey commercial/residential project enjoys the same density permissions as that sought by Minto. This development, at 1250 Bay Street, would share access to and the use of Genoa Street with Minto's project, if approved. The proponent of 1250 Bay Street, Shui Pong Developments Ltd., relies on the widening and upgrading of Genoa Street to accommodate two-way traffic. The improvements to Genoa Street are offered to the City by Minto, however they maintain the option for subsurface parking below part of the dedicated right of way. Another thirteen storey retail office use is located to the southwest of the proposal, and a number of redevelopment projects of office-cum-retail uses are underway along Bay Street, south of Cumberland Street.

[para10] Minto originally submitted a development proposal under Section 45 of the Planning Act. It was observed that this was the course followed by the neighbouring development at 1250 Bay Street in achieving similar relief as is sought by Minto. However, planning staff at the City advised that a zoning by-law amendment was preferable. A revised application for an official plan amendment and re-zoning was therefore made and was eventually endorsed by staff. However, staff advised Minto that a final report would not be submitted to Council for approval until the amount of payment under Section 37 of the Planning Act was resolved. Minto's project is now before the Board without opposition from any quarter as to the physical merits of the proposal. On the contrary, the Board is advised that the neighbourhood and business interests have supported and promoted the development proposal. At the pre-hearing conference, the City estimated the value of the required contribution under existing policies to be between $2.4 to $2.6 million (50% of the increase in land value attributable to the excess in density sought). However, at the hearing, the City requested a contribution of $1,286,076, which represents 30% of the increase in land value (based on $55 per square foot) attributable to the excess in density sought. The re-calculation was based on a staff report respecting Section 37, released in July, 2000.

Bonusing and the City of Toronto

[para11] In order to determine whether Minto's applications should be approved, and if so should the by-law include a requirement to provide public benefits pursuant to Section 37 of the Planning Act, it is necessary to review the history of how bonusing payments have been addressed in the former City of Toronto and since amalgamation, on a city-wide basis. The City contends that bonusing arrangements have been

in place for many years and public benefits must be a requirement of Minto's approval given it seeks increases in height and density. Minto's position is that the history of bonusing arrangements reveals an inconsistent approach by the City and it is impossible for a developer to predict on what basis contributions under Section 37 may be requested or with respect to Minto's project, the rationale for a contribution amounting to $1.2 million.

[para12] The Planning Act clearly authorizes bonusing arrangements in Section 37 (formerly Section 36) which provides as follows:

> (1) The council of a local municipality may, in a by-law passed under Section 34, authorize increases in the height and density of development otherwise permitted by the by-law that will be permitted in return for the provision of such facilities, services, or matters as are set out in the by-law.
>
> (2) A by-law shall not contain the provision mentioned in subsection (1) unless there is an official plan in effect in the local municipality that contains

provisions relating to the authorization of increases in height and density of development.

(3) Where the owner of land elects to provide facilities, services, or matters in return for an increase in height or density of development, the municipality may require the owner to enter into one or more agreements with the municipality dealing with the facilities, services, or matters.

(4) Any agreement entered into under subsection (3) may be registered against the land to which it applies and the municipality is entitled to enforce the provisions thereof against the owner and, subject to the provisions of the Registry Act and the Land Titles Act, and any and all subsequent owners of the land.

[para13] Mr. Langdon, the City's main planning witness, provided comprehensive evidence in respect of the history behind the development of bonusing policies in the City. There was no dispute between the parties that bonusing agreements have been successfully negotiated and employed since the 1980's to provide a wide range of public benefits in return for increases in height and density. Mr. Langdon testified that the City has relied on Section 37 since its enactment in 1983 to secure public benefits in connection with approximately 70 projects. However, in all of the examples provided to the Board, Section 37 agreements had been the subject of negotiation. In its appeal, the Board has been requested by Minto to exercise the discretion normally afforded to Council and to decide whether public benefits ought to be required and if so, at what level.

[para14] Prior to 1993, Section 37 was employed by way of site specific Official Plan amendments as there were no general policies available in the City's Part 1 Official Plan relating to bonusing. The Part 1 policies introduced in 1993 and approved by the Province in 1994, remain in effect today.

[para15] The significant events in connection with bonusing arrangements in the City as presented in the evidence of Mr. Langdon are as follows:

1983: The Planning Act was amended to include Section 36 (now Section 37)

1987-1993: The City undertook a special study to provide the basis for general bonusing policies in its Official Plan. During that same time period Section 37 agreements were negotiated and entered into for a variety of projects on a site specific basis. Site specific plan amendments, as opposed to general policies in the Part 1 Official Plan, are relied upon to give effect to these agreements.

1993: The City adopted general provisions relating to bonusing in section 16.21 of its new Official Plan and that plan was approved by the Province in 1994. As a result of the recession and general slowdown of economic activity, bonusing arrangements were not pursued for all development projects even though official plan and zoning amendments authorizing increases in density and height were approved by City Council.

Late 1998 to May 1999:

The principles contained in section 37 relating to bonusing were pursed by staff in some minor variance applications where significant increases in height and density were sought. On May 11th and 12th, 1999, as a result of reports prepared in response to the Mayor's Task Force on Homelessness, Council formally directed staff by resolution to pursue Section 37 type agreements as conditions

of approval in connection with minor variance applications. Specifically, staff were directed to request the Committee of Adjustment to impose conditions requiring contributions to the Capital Revolving Fund for Affordable Housing. Council also directed staff by resolution dated May 11th, 1999 to immediately pursue contributions toward the provision of affordable housing pursuant to Section 37 on a city-wide basis. Concurrently, Council adopted a Development Charges By-law for the amalgamated City.

July, 1999 to August, 2000:

Council directed staff to review the future use of section 37 on a City-wide basis. Following a year of study and public consultation with stakeholders, a staff report entitled "Section 37 of the Planning Act, Respecting Exchange of Increased Density or Height for Public Benefits Proposed City Wide Implementation Framework" (the "Implementation Framework") was prepared and presented the City's Planning and Transportation Committee in July, 2000. The Implementation Framework report directed staff to require contributions under Section 37 equivalent to 30 percent of residual increase of the land value

resulting from the increase in density. A mechanism for implementation was provided as well as direction to staff that existing Section 37 agreements were to remain in place, regardless of the terms of the Implementation Framework.

[para16] Prior to the introduction of general policies in the Part 1 Official Plan, Section 36 (now Section 37) agreements were secured on a project by project basis. Mr. Langdon provided the Board with examples of projects where increases in height and density were authorized in exchange for public benefits. The Board was directed to projects such as the Eaton Centre, Scotia Plaza, Water Park Place and the World Trade Centre. In each instance the agreements were the product of negotiation resulting in the developer electing to enter into an agreement pursuant to Section 37(3) of the Planning Act.

[para17] Similarly, prior to the adoption of the general bonusing policies in the City's Part 1 Official Plan there were appeals to the Board that involved bonusing arrangements. However in each case agreements had been negotiated by the municipality and the developer, and objectors had appealed the proposed amendments. While the cases presented to the Board by Counsel were decided prior to the inclusion of general bonusing policies in the Part 1 Official Plan, there are some broad principles surrounding bonusing that are relevant to this appeal:

* a by-law incorporating a Section 36 agreement should be a by-law passed pursuant to section 34. The election by the developer under subsection 37(3) must come before the by-law and be incorporated therein (Re Copthorne Holdings Ltd. (1987), 36 M.P.L.R 122 (OMB).

* a Section 36 agreement is appropriate in circumstances where negotiations have led to an agreement and the City's interest and the public interest are seemingly well protected. However, in the absence of consent it might not be correct to force such an agreement on the parties (Re Copthorne Holdings Ltd. supra).

* a Section 36 agreement relating to bonusing cannot form part of a by-law amendment in the absence of comprehensive policies for bonusing in the Official Plan. To do otherwise would lead to uncertainty as to where, when and how any increases in height and

density of development might occur. Height and density are issues that should not be left to ad hoc planning (Re: City of York Official Plan Amendment 105 and Zoning By-law 2171-91 (No. 1) (1991), 27 O.M.B.R. 41 ((OMB); Arsandco Investment Ltd. v. Toronto (City), [1991] O.M.B.D. No. 2128 (OMB).

* the appropriateness of a site specific official plan amendment and a bonus provision by-law should be determined on the merits of an individual application. In the absence of general policies in the plan, a site specific amendment can be passed immediately prior to the zoning by-law (Tye v. Borough of East York Committee of Adjustment (1992), 27 O.M.B.R. 479 (OMB); Re Toronto (City) Bay Street Official Plan Amendment, [1992] O.M.B.D. No. 2075 (OMB); Re Ernst & Young (1993), 14 M.P.L.R. (2nd) 196 (OMB).

[para18] Following the introduction of the general bonusing policies in 1993, the evidence was that while Section 37 agreements were executed, each had been negotiated by the parties. Clearly a wide range of public benefits have been secured by the City over the years, however, each agreement has been the subject of negotiation between the parties. To the extent these agreements were before the Board, they had been presented with Official Plan and zoning amendments on the consent of the parties (see for example Toronto (City) World Trade Centre Official Plan Amendment (Re), [1994] O.M.B.D. No. 521 (OMB) and 40 Bay Street Holdings Inc. v. Toronto (City), [1994] O.M.B.D. No. 1738 (OMB). In those instances, the terms of the agreements were not the subject of the appeals to the Board.

[para19] In late 1998 staff began to pursue Section 37 type agreements through the minor variance process. Thereafter, Council passed a resolution in 1999 directing that contributions to affordable housing be secured. While it is not necessary for the Board to deal with the merits of this approach, suffice to say that in regard to minor variance applications, public benefits have been secured, particularly in the area of affordable housing, as a condition pursuant to subsection 45(9) of the Planning Act. In examples cited to the Board by both Mr. Walker and Mr. Langdon with respect to this approach it was clear that these arrangements were on consent and made outside the bonusing policies set out in the Part 1 Official Plan and were not agreements made pursuant to Section 37. Indeed, the project at 1250 Bay was one example provided to the Board in this regard. It was demonstrated in the evidence of Mr. Walker, and not contradicted by Mr. Langdon, that many of the recently approved developments for densities and/or heights in excess of the by-law provisions have proceeded by way of approvals by the City's Committee of Adjustment with concurrence of (or at least without objections by) City Council, in spite of the language of Section 37 provisions.

[para20] Concurrent with Council's resolution and direction to staff in respect of minor variance applications, staff was further directed to commence a review of the future use of Section 37, in consultation with key stakeholders. Mr. Langdon was a key member of the study team. The resulting Implementation Framework (Exhibit No. 23) is intended to provide "direction regarding where, when and how section 37 is to be used and establishes a consistent relationship between the cost to the developer of providing public benefits and the value to the developer of the increased density and height. Clarification of what public benefits are to be secured, including the achievement of an appropriate balance between local and city-wide benefits, is also part of the framework" (at p. 4).

[para21] It is against this background that the Board must determine the merits of the proposed official plan and zoning by-law amendments.

Official Plan Policies Addressing Section 37

[para22] There was no dispute among Counsel that the Board has the original jurisdiction to determine the matters before it and the Board may make any decision Council could have made in dealing with the application (Re Esplen and Lakespray Developments Inc. (1986), 54 O.R. (2nd) 498 (Div'l Ct.). In making its decision, the Board is required to exercise its

independent judgement on the merits of the application (Re Hopedale Developments Ltd. and the Town of Oakville (1964), O.R. 1965 Vol. 1 259 (C.A.). It is well settled law that pursuant to Section 24 of the Planning Act the Board cannot approve any by-law unless it conforms with the official plan and in doing so it must give the official plan a broad liberal interpretation with a view to furthering policy objectives (Bele Himmell Investments v. Mississauga (City) (1983), 13 O.M.B.R. 17 (Div. Ct.).

[para23] Whether Minto's proposed increases in height and density without the contribution of further public benefits are appropriate and whether public benefits ought to be a requirement of any approval are issues that must be addressed together. It is the position of the City that while the general planning merits of the Official Plan and zoning by-law amendments are not in dispute, a condition of any approval must include a requirement that Minto provide a package of public benefits by way of an agreement pursuant to Section 37.

[para24] Both Mr. Walker and Mr. Langdon agree that a necessary prerequisite to the exercise of the authority for requiring the provision of "facilities, services or matters" under Section 37 is the inclusion of "provisions relating to the authorization of increases in height and density of development" in the municipal Official Plan. On that basis, the Board finds that a Section 34 by-law should be tested as

to the appropriateness and conformity of any such "development otherwise permitted", together with the conformity of the appropriateness of "such facilities, services or matters" required as a result of the excess height and density in relation to established official plan policies. The Board finds these to be two related but severable and sequential tests:

(1) the increases in height and density must be defensible on good planning grounds; and

(2) the contributions requested must be within the clear limits of established policy.

[para25] That is, the contribution of facilities, services and matters pursuant to Section 37 cannot be a means of making a bad application good, but might validly make a good application better.

[para26] It is clearly the municipality's prerogative whether or not in individual cases it will require contributions in return for increases in height and density. Under what circumstances and in what locations it may exempt an application, is in the absolute discretion of the municipality. Notwithstanding, the municipality may choose to incorporate the framework for requiring contributions when, where, or how much and for what purposes in its' Official Plan. Only where such a framework is provided in the Official Plan policies, can Council require a contribution, and staff are bound to implement those policies.

[para27] In determining the applicability of Section 37 to this application, the Board has to look at the wording of the general policies respecting bonusing as contained in the Official Plan. The evidence was clear that there are no site specific Part II bonusing policies in effect for the area in which the development proposal is located. Section 16.21 of the Official Plan addresses General Policies Respecting Section 37:

(a) When passing by-laws which include increases in the height and/or density of development respecting a site-specific development proposal, council will ensure that the density and/or height increase is consistent with the objectives of this plan regarding building form and the physical environment, and, in such instances, may also authorize the use of Section 37 of the Planning Act, 1990, and enter into legal agreements under that section in order to secure the positive features of the development proposal including, as appropriate, but not limited to, the realization of the objectives of this plan respecting social housing, non-profit community, cultural and institutional facilities, heritage preservation and parks.

(b) In addition to policies of Section 16.21(a), 13.16 and 13.17, in utilizing its powers under Section 37, Council may develop bonusing policies applicable to specific areas of the city and under circumstances of a more general application. In such instances, it is the policy of Council to proceed generally in accordance with the following guidelines:

...

[para28] Both planners concur that the above policy Section 16.21(a) most directly applies to the present proposal. Section 16.21(a) addresses site specific development proposals, and by that fact it is distinguished from Section 16.2(b) applicable to "specific areas of the city" and for general policy situations "where guidelines are set out for the implementation of bonusing policies".

[para29] It is also agreed that the application before the Board falls neither within the scope of a "specific area of the City" nor does it prescribe policies "of a more general application". Notwithstanding this, Mr. Langdon testified that it has been the practice of his department when it finds it necessary, to apply the provisions of Section 16.21(b) to Section 16.21(a) "type" cases as a guideline. Even so, staff's practice is that for good and sufficient reason, they may deviate from these very "guidelines". Mr. Langdon defends this practice as follows:

(1) (There are no explicit guidelines applicable to determining the appropriate contributions in Section 16.21(a) cases;

(2) (As guidelines, staff are well within their authority to modify the incidence of the contributions within the spirit of the plan; and

(3) (This practice has never been contested previously by developers and over the years considerable contributions have been paid to the City in return for bonusing, which contributions have been applied to designated projects under the plan.

[para30] Consequently, an additional matter for determination by the Board is whether or not the provisions of Section 16.21(b) are "indirectly" relevant to the provisions of Section 16.21(a). If "indirectly" relevant, how can they be appropriately applied to the case before the Board. If not relevant in any way, what is the appropriate application of Section 16.21(a) of the Official Plan?

Section 16.21(a) Provisions

[para31] In accordance with the Planning Act, the municipality intends to exercise its discretion when applications for site specific developments come forward under Section 34 of the Act to authorize or not authorize, as the case may be, increases in the height and density of development in return for "a provision of such facility, services, or other matters as are set out in the by-law". In such cases, the development must be "otherwise permitted by the by-law", the density and/or height increases must conform to the plan objectives regarding building form and the physical environment. The authorization of height and density increases is to be secured by a legal agreement and serve to "secure the positive features of the development", which among other things pertain to the Official Plan objectives "social housing", non-profit community cultural and institutional facilities, heritage preservation and "parks".

[para32] Once again it must be emphasized that the common evidence is that the building form and function is not in dispute and the Board finds that, but for the excess height and density, the development would be otherwise permitted by the by-law and that there is no offence to the Plan objectives regarding structure and impact of the proposal. This is a "site specific development" unlike a redevelopment proposal for an area of the City containing Section 37 provisions, for example, the Bathurst/Strachan Area Plan (Exhibit 22). Neither is this a by-law amendment to address an issue relating to more contributions for daycare centres, senior citizen housing, libraries, etc.

Contributions Under Section 16.21

[para33] Minto argues that having regard to the matters required to secure the positive features of the development, no contributions have been shown by the City to be necessary, and certainly the requested contribution of $1.2 million is in no way justifiable under existing policies. On the contrary, the appellant argues that the development will be creating and adding public benefits of improvements (widening, paving, lighting and street side decorations) to Genoa Street; improvements in street furniture and facilities to Bay Street and Yorkville Avenue, which should be counted as contributions. The City responds that these amenities are all voluntarily tendered by the proponent, and are even more beneficial to the presentation and marketing of the project than contributing to a public or social benefit. In particular, Mr. David testified that the improvements to the Genoa Street laneway are required in any event for the project to proceed, regardless of any further contribution pursuant to Section 37.

[para34] Mr. Langdon contends that neither in the Act nor in the Official Plan is there any suggestion that benefits contributed be "on site", that is within the development area. Mr. Walker, on the contrary, looks to the Official Plan and on the basis of its wording, draws the inference that if the policies in section 16.21(a) are specific to the development and the contributions are "to secure the positive features of the development proposal", then unless these positive features relevant to beneficial aspects of the development proposal are identified and the nature of the contributions determined, then they are not appropriate. In that respect, the Plan continues to describe examples of the type of positive features which might be applicable to the proposal: "social housing" policies of the Official Plan; non-profit community, cultural and institutional facilities policies of the Plan; heritage preservation policies of the Plan; and "park" policies. The Board finds from the wording of the Official Plan, supported by a fair expectation that it lies within the authority of Council to clarify what such contributions might be, that they be identified somewhere in the Plan so that the appropriate requirements of the development proposal can be ascertained.

[para35] Mr. Langdon addressed the evolution of this policy as practised in the City to indicate the planning objectives of the Official Plan for a range of capital facilities and amenities pursued via Section 37 agreements and other legislation, for example, the City of Toronto Act. He stated that these contributions have traditionally been secured on site and off site, and cash payments have been applied anywhere in the discretion of council, including social housing, daycare, art works, heritage preservation, cultural facilities, parkland and park improvements (beyond Section 42 provisions), district heating and cooling facilities, streetscape and infrastructure, walkways, etc. As indicated previously, the benefits of such contributions are well documented in acquisitions under Section 37 (or Section 37 type) agreements between 1980 and 1990. These include: land for 6,000 units of social housing; $19 million in lieu of land for social housing; six daycare centres contributing some 330 spaces with another 630 spaces pending. He alluded to the fact that since municipal amalgamation in January 1998, within the former City of Toronto, some twenty projects have been approved with Section 37 contributions and another seven made Section 37 type contributions under Section 45 (minor variance) applications. He observed that for the rest of the amalgamation areas there have been at least ten similar approvals within the principle of exchange in benefits for height or density increases.

[para36] In reviewing this evidence, the Board cannot diminish the persuasive submissions of Mr. Langdon that the vehicle of Section 37 provides a very significant mechanism to supplement urgent (particularly social) programs needed within the City which might otherwise remain underfunded, perhaps at some human cost. The efforts of the municipality are commendable and the fact that all of the contributors to this date have been the result of negotiated terms of agreements, is also commendable whatever the circumstances under which contributions were made. Mr. Langdon has itemized a number of successes demonstrating the nature of such benefits:

* 395 rental units replaced and relocation of tenants;

* $900,000 lodged in a Capital Revolving Fund for affordable housing;

* preservation of existing rental housing;

* two daycare centres for 52 and 26 spaces operated as non-profit turnkey facilities;

* parkland plus $1.2 million payments in lieu over and above Section 42 requirements;

* parkland improvements;

* $1 million to offset costs of Dundas Square;

* heritage preservation and restoration projects;

* $400,000 cash contributions to heritage restoration/preservation.

[para37] It is against this solid record of accomplishment that the City is endeavouring to maintain the opportunity of benefits under Section 37. Mr. Langdon states that since 1998 his department has regularly requested benefits as part of conditions attachable to authorizations of variances for excess density and height. He states that these efforts have been accentuated by The Report of the Mayor's Task Force on Homelessness and recommendations emanating from it that cash contributions received as conditions to variance authorizations and contributions be deposited in a Capital Revolving Fund for affordable housing.

[para38] The Board need not address any further issues of what was described in evidence as Section 37 type contributions as conditions of variance applications except to note that Mr. Sherriff-Scott, an official with Minto, testified that his company initially sought identical treatment and approvals as 1250 Bay Street, but was advised to proceed by way of an Official Plan Amendment and site re-zoning instead, which triggered the Section 37 provisions.

Section 16.21(b) Provisions

[para39] Should a Section 37 contribution be applicable to the site, Mr. Langdon looks to Section 16.2.1(b) of the Plan for guidance as to the scope and quantum of the benefits receivable. He advised the Board that the relevant policy guidelines are subsections (b) i), ii), vi), vii), and viii).

(b) i) In determining the size of any increase in height and/or density which may be authorized in accordance with this section, Council shall be satisfied that any development resulting from a by-law authorizing an increase in density and/or height is consistent with and does not adversely impact on the objectives and policies of this Plan, particularly those respecting built form and the physical environment. Council also will ensure that:

...

3. the relationship between the value of the density increase and the cost of the provision of the facility service or matter has been determined through special study and is applied in a consistent and equitable manner by means of a formula which equates an increment of floor area to a specific benefit, in accordance with vi) and vii), below.

...

vi) With regard to any increases which may be authorized in order to promote the provision of social housing Council shall ensure that the estimated value of any increases in height and/or density should generally not exceed approximately two times the estimated cost of

providing the social housing contribution.

vii) With respect to any increases in height and/or density which Council may authorize in exchange for benefits other than social housing, Council recognizes that certain benefits also enhance the value of private development, and that in such instances a smaller incentive than that provided for social housing would be appropriate.

[para40] Mr. Langdon has confirmed that no study such as anticipated by subsection 16.21(b)i)3. was ever done to establish the value of the density increase and the cost of the provision of the facility, service or matter required by the municipality. Without such a study, "the relationship" between value and cost cannot be determined. The parties have agreed on an appraised value of the increased height and density of $55 per square foot. Mr. Langdon testified that the City is entitled under Section 16.21(b)vii) to require contributions for "social housing" at one half that total value. This interpretation, in the Board's view, reverses "the relationship" alluded to in subsection 16.21(b)i)3. Clearly, the estimated cost of the "social housing" benefit is one to be derived independently of the excess height and/or density requested.

[para41] Neither that approach or even the very process advocated by Mr. Langdon, has been followed in this instance. On the basis of a 50% contribution of the value of the bonus, the City initially requested a contribution of $2.4 to $2.6 million. Subsequently, the estimate of benefits was recalculated based on 30% of the increase in land value. Mr. Langdon testified that the estimate has been modified by City staff at its discretion. Minto therefore questions the imposition of Section 16.21(b) on its application and whether in applying it the City is doing so in accordance with the Official Plan, "in a consistent and equitable manner," when it does so arbitrarily. Lastly, Minto submits that under subsection (b) vii), were it to be found applicable, certain benefits have been created by the development which enhances the value of surrounding property and the Yorkville district in general and ought to be discounted on that account. On the basis of the above, the Board finds that Section 16.21(b) does not apply to the application. The Board is further persuaded that even if Section 16.21(b) did apply, there is no special study and the proper relationship between cost and value cannot be determined.

Benefits Under 16.21(a)

[para42] Mr. Walker argues that for this site specific development, the City has not demonstrated any positive features of the proposal which require developer contributions in conformity with the policies of the Plan. Four particular subject areas are identified in Section 16.21(a) and the proponent has assessed its project against each area.

(1) Social Housing

Contributions for social housing is specifically mentioned as a potential benefit in the Official Plan under Section 37. Mr. Walker suggests that within the definition of the subject project inclusion of social

housing units would not be realistic nor feasible. That is not disputed by Mr. Langdon who argues that in this case the proponent might make a cash contribution into the City's Capital Revolving Fund for affordable housing.

That suggestion is not acceptable to Mr. Walker by his interpretation of the policy that contributions should "secure the positive features of the development proposal". In his view, if it is not needed it should not be given. Secondly, he questions the authority of the municipality to apply any contributions to "affordable housing". He notes that the policy suggests use for social housing which is a defined term.

Social housing is a defined term in the Official Plan and is not interchangeable with affordable housing, as suggested by the City. The evidence of the City was that since the federal government cancelled its subsidized programs, the term "social housing" as it appears in the

Plan has been understood to mean affordable housing. The Board finds that in this case, the City should have amended its plan to make that clear. While official plans are to be given a wide interpretation, social housing is a defined term and as such, those reading the plan, should be able to rely on the definition contained therein. The Board finds that by the precision of a definition, it is clear that Council intended to exercise some control in the funding of such programs. It may well be argued that Council prescribed a process which without the participation of other levels of government, Council would find it disadvantageous to be funded entirely out of Section 37 contributions. The Board therefore agrees with Minto that a contribution for "social housing" is not justified.

(2) Non-Profit Community, Cultural and Institutional Facilities

As in the case of social housing, the Board finds that the necessity for non-profit community, cultural or institutional facilities must be identified within the context of "the development proposal". The City has not demonstrated what facilities of this nature might be necessary "to secure the positive features" of the application. Minto is similarly unable to identify needed facilities of this kind. The project is a high end residential condominium with conventional recreational amenities on site and there exist a satisfactory endowment of cultural and institutional facilities in the surrounding district.

(3) Heritage Preservation

Both parties concur that there are no heritage features on site which require or deserve preservation.

(4) Parks

Like social housing, parks is a defined term in the Plan which refers to a definition of park requirements. The Board finds on the evidence of Mr. Walker with reference to inventories by the City, that there is no deficiency of park space within and surrounding the subject location and accordingly provision for a park contribution cannot add to the positive features of the development proposal.

[para43] While Section 16.21(a) anticipates that there may be other matters which could validly be included for contribution, these need to be firmly couched within a persuasive benefit to the development project. The City has not provided identification or support for any such "matters" and additional contributions may thereby be disregarded.

[para44] The Board finds that when seeking increases in height or density any applicant should be able to ascertain with some certainty what it will be required to provide in terms of a package of public benefits pursuant to Section 37. Within the City in those instances where requests for benefits have been made, a negotiated agreement has been the result. In this case, the Board finds that the application meets the intent of the Part 1 Official Plan policies, including section 16.21(a), without the requirement for any further contribution pursuant to Section 37. Section 16.21(a) is a discretionary, not mandatory, policy and prior to requiring any contribution under Section 37 the City should be able to demonstrate that such contriution falls within the scope of the criteria contained in the policy.

The Implementation Framework

[para45] By the City's own admission, the Implementation Framework is intended to bring predictability, clarity and consistency to the use of the Section 37. In The Omni at the City Centre Inc. v. City of Toronto (OMB, PL000368, dated August 31, 2000), the Board excluded Council's resolution adopting the Implementation Framework from future proceedings for that application and the ruling was adopted by Counsel at the outset of this hearing. Mr. Langdon testified that the relevance of the Implementation Framework is that it is evidence of staff's efforts to establish criteria in respect of the application of Section 37, especially as it relates to the appropriate level of public benefits to be secured.

[para46] The evidence of Mr. Langdon was clear that through the Implementation Framework, the City has embarked on a new process designed to correct deficiencies it acknowledges exists with the existing general policies. Given the Implementation Framework was prepared after Minto's appeal to the Board and it is not, in any event, a policy contained in the City's Official Plan, the criteria contained within the Implementation Framework cannot form the basis for determining, in this instance, whether public benefits should be required or a level of public benefits. While the level of public benefits calculated on the basis of 30 percent of the net increase in land value is consistent with the criteria set out in the Implementation Framework, there is nothing in the existing Plan policies that refers to a contribution of 30 percent as an appropriate level of benefits.

[para47] The Implementation Framework candidly states that there is a need for clarity and consistency on the City's part regarding the continued use of section 37 (at p.2) and the City has embarked upon a process to correct the deficiencies acknowledged by the City in respect of the use of Section 37. The Implementation Framework constitutes recommendations from staff on the future use of Section 37 and it cannot form the basis for this application in either determining or requiring an appropriate level of public benefits. That determination must be made within existing policies as set out in the City's Official Plan. The Implementation Framework does however represent considerable effort on the part of City staff to develop a revised approach to the use of Section 37 that has the potential to bring predictability and clarity to the process. It is now for the City to determine what status it wishes to give the Implementation Framework.

Conclusions and Findings

[para48] Based on the foregoing, the following findings are relevant to the decision that the Board must make:

1) A requirement for a contribution pursuant to Section 37 must fall within the scope of a Section 34 by-law amendment.

2) Council has the discretion on a case by case basis whether or not to require contributions pursuant to Section 37 as long as there exist applicable Official Plan policies to support those contributions.

3) Where contributions are required and the proponent elects not to make the required contribution, an appeal lies to this Board, on the basis first, that the application meets all the applicable tests under Section 34 of the Planning Act; and second, that the request for contributions under Section 37 is not in conformity with the Official Plan.

4) With regard to the subject application, the City has approved Official Plan policies in Section 16.21 which respond to Section 37(2) of the Planning Act and provide a basis for assessing the conformity of this appeal to those policies.

5) The policies relevant to this application are contained in Section 16.21(a), which is specific to a single development proposal for a re-zoning to accommodate excess height and/or density. Given the agreement of the parties that the particulars of building form and the physical environment are not in contention, it is appropriate for the City to consider contributions pursuant to Section 37.

6) Whether or not contributions should be authorized must be judged on the beneficial effects of such contributions to the development proposal and it lies with the municipality to demonstrate the connection between the proposal and the benefits.

7) In the absence of a clear demonstration by the City of the basis for the benefits to be provided and the contributions requested, it remains the obligation of the applicant to meet the criteria set out in the Official Plan. In this instance, Minto fully

addressed the criteria contained in Section 16.21 (a).

8) The Board finds that there is no proven need to require contributions from Minto because there are no benefits to the development project, as prescribed under the City's Official Plan policies in Section 16.21(a). Section 16.21(b) is not applicable to Minto's project.

9) Given the significance and the potential impact of the authority granted to municipalities under Section 37 of the Planning Act, and the objective of the legislation to require municipalities to spell out the exercise of that authority for clear, equal and consistent application without arbitrariness, including where and when contributions are required, the Board finds that the latitude exercised by staff to require contributions beyond what is obvious from policy is not supportable. Neither will the Board, in this instance, interpret the policy and exercise this latitude.

10) Given that the Board finds the proposed amendments are appropriate without the contribution of further public benefits it is not necessary to determine a level of benefits.

11) The Board finds that the Official Plan and Zoning amendments and the proposed Site Plan application are appropriate and constitute good land use planning pursuant to the provisions of the Planning Act.

[para49] The Board orders as follows:

1) That the appeals are allowed;

2) That approval is granted in principle to the proposed site plan as representing an acceptable form and tolerable impacts on the surrounding environment;

3) That approval is given to the Official Plan

Amendment as included in Attachment "1" to this decision;

4) That the City's zoning by-law is hereby amended in the manner included in Attachment "2" to this decision; and

5) That the parties proceed to finalize details of site plan approval, and to conclude a site plan agreement for submission to the Board within ninety (90) days of this decision for its disposition, failing which the Board may be invited to reconvene this hearing for eventual determination. In this respect, this Board continues to be seized.

[para50] The appellant has indicated its intention to approach the Board on the matter of costs and in that event, should it be necessary, this Board remains seized.

ATTACHMENT "1"

EXPLANATORY NOTE TO PROPOSED OFFICIAL PLAN AMENDMENT

The purpose of this Official Plan Amendment is to amend the City of Toronto Official Plan by adding site specific policies respecting 1252-1260 Bay Street and 61-63 Yorkville Avenue. The Amendment would allow the redevelopment of the approximately 0.2 hectare (0.5 acre) site located at the south west corner of Bay Street and Yorkville Avenue.

The subject lands are presently developed with a seven storey building with a variety of commercial uses and a two storey house form building which is used for retail purposes.

The current designation in the Official Plan of 1252-1260 Bay Street is "High Density Mixed Commercial-Residential A" which permits a range of commercial and residential uses at a maximum density of 6 times the lot area. The current designation of 61-63 Yorkville Avenue is "Low Density Mixed Commercial-Residential" which permits a range of commercial and residential uses at a maximum density of 3 times the lot area.

The Amendment would permit development densities on the site beyond those currently permitted in the Official Plan and would facilitate the development of 171 residential dwelling units and approximately 700 square metres of grade related retail uses within an 18 storey building. The total density of the development would be 9.9 times the area of the lot

Through the amending zoning by-law, the proposed redevelopment of the parcel would be sensitive to the adjacent uses through the appropriate transition of built form.

CITY OF TORONTO
BY-LAW No. -2000

To adopt an amendment to the Official Plan
in respect of
Nos. 1252-1260 Bay Street and Nos. 61-63 Yorkville Avenue.

WHEREAS pursuant to Section 17 of the Planning Act, the Council of a municipality may in a by-law approve an amendment to the Official Plan respecting the mixed use development of Nos. 1252-1260 Bay Street and Nos. 61-63 Yorkville Avenue.

THEREFORE the Council of the municipality enacts as follows:

1. The text and map annexed hereto as Schedule "A" are hereby adopted as an amendment to the Official Plan for the City of Toronto.

2. This is Official Plan Amendment No.

(1) The Official Plan for the former City of Toronto,be amended to add a new Section 18 provision as set out below:

"18. Lands known as Nos. 1252-1250 Bay Street and Nos. 61-63 Yorkville Avenue.

See Map 18. _____ at the end of this section.

Notwithstanding any of the provisions of this Plan, Council may pass by-laws applicable to the lands delineated by heavy lines on Map 18. ____, to permit the erection of a mixed-use building, provided that:

The total gross floor area does not exceed 18,382 square metres of which;

(1) The maximum residential gross floor area of the building does not exceed 17,800 square metres;

(2) The maximum non-residential gross floor area of the building does not exceed 800 square metres and is located at grade;

[Quicklaw note: Schedule "A", Map 18, could not be reproduced online. Please see paper copy.]

ATTACHMENT "2"

EXPLANATORY NOTE FOR PROPOSED ZONING BY-LAW AMENDMENT

The purpose of By-law ____ is to amend the City of Toronto Zoning By-law 438-86. as amended, respecting 1252-1260 Bay Street and 61-63 Yorkville Avenue. The by-law would allow the redevelopment of the approximately 0.2 hectare (0.5 acre) site located at the south west comer of Bay Street and Yorkville Avenue. The subject lands are presently developed with a seven

storey building with a variety of commercial uses and a two storey house form building which is used for retail purposes.

The current zoning on the parcel at 1252-1260 Bay Street is CR T6.0 C4.5 R6.0 and the parcel at 61-63 Yorkville Avenue is zoned CR T3.0 C2.5 R3.0. These zones permit a mix of commercial and residential uses to a total density of 6.0 times the lot area in the T 6.0 zone and 3.0 times the lot area in the T3.0 zone. The zoning permits residential uses to 6.0 times the area of the lot at 1252-1260 Bay Street and 3.0 times the area of the lot at 61-63 Yorkville Avenue. Commercial uses are permitted at a density of 4.5 times the area of the lot at 1252-1260 Say Street and at 2.5 times the area of the lot at 61-63 Yorkville Avenue. The maximum permitted height at 1252-1260 Bay Street is 46 metres and 18 metres for 61-63 Yorkville.

The zoning amendment would allow an increase in height and density beyond that permitted in the Zoning By-law and would facilitate the development of 171 residential dwelling units and approximately 640 square metres of grade-related retail uses within an 18 storey building. The total density of the development would be 9.9 times the area of the lot. The attached Zoning By-law establishes the restrictions and building envelope to facilitate this development.

The proposed redevelopment of the parcel would be sensitive to the adjacent uses through the appropriate transition of built form.

BY-LAW No. -2000

To amend By-law No. 438-86 of the former City of Toronto, as amended, respecting 1252-1260 Bay Street and Nos. 61-63 Yorkville Avenue.

WHEREAS pursuant to Section 34 of the Planning Act,

Council of a municipality may pass a by-law governing the height, mass, density and location of a use;

NOW THEREFORE the Council of the City of Toronto enacts as follows:

1. None of the provisions of sections 4(2), 4(12), 8(2)5, 8(3) Part I 1, 8(3) Part I 2, 8(3) Part I 3, 8 Part II, 8(3) Part XI (2)(ii),12(2) 259, 12(2)260(ii), of By-law No. 436-86, being "A By-law to regulate the use of land and the erection, use, bulk, height, spacing of and other matters relating to buildings and structures and to prohibit certain uses of lands and the erection and use of certain buildings and structures in various areas of the City of Toronto", as amended, shall apply to prevent the erection of a mixed use building, provided:

   (1) The lot on which the proposed building is to be located comprises those lands delineated by heavy lines an Plan 1 attached to and forming part of this By-law;

   (2) No pardon of any building located above grade is

   located otherwise than wholly within the areas delineated by heavy lines and within the height limitations shown on Plan 2 attached to and forming part of this By-law with the exception of cornices, canopies, ornamental elements, parapets, and railings which may extend beyond the building envelope shown on Plan 2.

   (3) The total floor area does not exceed 18,382 square metres;

   (4) The residential gross floor area does not exceed 17,800 square metres;

   (5) The non-residential gross floor area does not exceed 800 square metres and is to be located at grade;

   (6) There are not more than 171 dwelling units within the building;

   (7) At least 110 parking spaces and 1 Type G loading space are provided on the lands shown on Plan 1

attached to and forming part of this By-law;

(8) At least 129 bicycle parking spaces, 103 allocated for use by residents of the development and 26 allocated for use by visitors to the development are provided on the lands shown on Plan 1 attached to and forming part of this By-law;

(9) 342 square meters of indoor residential amenity space is provided and 210 square metres of outdoor residential amenity space, accessible from the indoor residential amenity space, is provided;

(10) 28.8 square metres of common outdoor space is provided;

(11) The grade level retail use is not less than 7.0 metres from the Bay Street property line, measured from the main wall of the building;

(12) The grade level retail use is a width of a least 60 percent of the street frontage of the building along Bay Street and 38 percent of the street frontage of the building along Yorkville Avenue;

2. In cases where there is a conflict between this By-law and the provisions of By-law 438-86, as amended, this By-law shall apply.

3. For the purposes of this By-law each word or expression which is italicized herein shall have the same meaning as each ward or expression as defined in the aforesaid By-law No. 438-86, as amended.

Weinberg v. Saunders

Between
Gerald Weinberg and Lore Weinberg, Applicants, and
Rodney Saunders, Township of Euphrasia and Rod Leuty,
Respondents

Ontario Judgments: [1989] O.J. No. 2228
Action No. 1238/89

Ontario District Court - Grey County
Owen Sound, Ontario
Zelinski D.C.J.
December 12, 1989

M. Granat and I. Rogers, for G. Weinberg and L. Weinberg.
D. Greenfield, for R. Saunders.
N. Kopperud, for the Township of Euphrasia.

ZELINSKI D.C.J.:--

THE ISSUE

Mr. & Mrs. Gerald Weinberg (the "Weinbergs") have made an application to me for the revocation of a building permit (the "Building Permit") issued by the Respondents, the Township of Euphrasia, (the "Township") and its Chief Building Official, Rod Leuty (the "CBO"), to the Respondent Saunders ("Saunders"), who is, co-incidentally, the reeve of the Township. The Weinbergs also seek an Order, to extend the time for making their application.

By way of preliminary objection, Saunders argues that I have no jurisdiction in this matter, firstly, on the grounds that the Weinbergs have no status to make their application and secondly, because they are late in doing so in circumstances where I should not exercise my discretion to extend the time for so doing. He also alleges, on the merits, that the Weinbergs' position is now moot.

The Township and CBO support Saunders in his position.

I declined to hear argument on the merits of this application pending my determination of my jurisdiction. I accepted Saunders' argument that the application is not timely and that I ought not exercise my discretion to extend time. I also reserved my decision on the status of the Weinbergs to make their application. I have promised to deliver written reasons upon these matters and am taking this opportunity to carry out my undertaking.

RELEVANT PROVISIONS TO THE BUILDING CODE ACT (the "Act")

6. (1) The chief official shall issue a permit except where,

(a) the proposed building or the proposed construction or demolition will not comply with this Act or the building code or will contravene any other applicable law; ....

(c) the application therefore is incomplete or any fees due are unpaid.

(4) Subject to S. 15, the chief official may revoke a permit,

(a) where it was issued on mistaken or false informaion;

15. (1) Any person who considers himself aggrieved by an order given or decision made by an inspector or chief official under this Act or the regulations may, within twenty days after the order or decision is made, apply to the judge of the county or district court for a hearing and appeal.

(5) A judge to whom application is made for a hearing under subsection (1) may extend the time for making the application either before or after expiration of the time fixed therein, where he is satisfied that there are prima facie grounds for granting relief to the applicant pursuant to a hearing and that there are reasonable grounds for applying for the extension and may give such directions as he considers proper consequent upon the extension.

THE FACTS

The Weinbergs are landowners and rate-payers residing in the Township. They consider themselves aggrieved within the meaning
of S. 15(1) of the Act because planning in the Township "is being done in a haphazard manner and not in accordance with sound planning principles, ... the Planning Act, and the zoning and building by-laws", as well as the fact that the Building Permit was issued despite their appeal of the zoning amendment by-law which was a condition precedent to the Building Permit being issued. They contend that their appeal had the effect of staying by-law No. 10-1989 (the "Zoning Amendment By-law,") with the consequential effect that the authority of the CBO to issue the permit thereunder was stayed. Finally they argue that the lands in question in this application (the "Subject Lands") were not separately registered, that the application for the Building Permit was incomplete when made, and that it was based on mistaken or false information.

A brief history of prior events is required.

On January 5, 1989, the Grey County Planning Committee granted three severances including that of the Subject Lands to Saunders. The reason for its decision relative to the Subject Lands was that "the Committee is satisfied that this will create a suitable estate residential lot on land that is of minimal agricultural value".

The Committee's decision was conditional upon the Township passing an amendment to its By-law No. 15-1971 (the "Comprehensive Zoning By-law") so as to ensure appropriate zoning. The necessary amendment was effected on April 6, 1989 by the Zoning Amendment By-law which purported to rezone the Subject Lands from Rural A2, to Rural Residential RUR designation. Shortly thereafter (on either April 30, 1989 or May 8, 1989), the Weinbergs appealed the Zoning Amendment By-
law.

On June 12, 1989, Saunders applied for the Building Permit in relation the whole of the lands which he owned, including the Subject Lands. He was aware of the Weinbergs' appeal when he did so. The Weinbergs note the following deficiencies relative to the application:

a) it did not specify:

(i) the part of the whole of the lands which was affected;

(ii) the front, rear and side yard setbacks;

b) it specified an effective RUR zoning (when in fact that zoning was under appeal and therefore not in effect).

The Comprehensive Zoning By-law requires a more substantial frontage (450' v 370'), and a greater minimum area (25 acres v 2.80 acres) than are contained in the Subject Lands.

The Weinbergs also note that By-law No. 18-1988, by which the CBO was hired, indicates he only is to issue building permits when certain requirements are met including proof of lot registration, proper zoning and the ability to meet front and side yard requirements.

Upon learning of the issuance of the Building Permit on or about June 20, 1989, Gerald Weinberg spoke to the CBO, who was apparently not aware of the Weinbergs' appeal. This is not unreasonable. The Township Clerk (the "Clerk"), had failed to file notice of the appeal with the OMB until August 4, 1989 despite the requirement of S. 34(21) of the Planning Act requiring her to do so "upon receipt". When the Clerk was being cross-examined on her affidavit herein, the Township solicitor refused to permit her to explain the reason for the delay of almost three months.

The CBO is stated to have indicated to Mr. Weinberg that he would not have issued the Building Permit if he had been aware of the fact of the appeal but he has done nothing since learning of the appeal to revoke the Building Permit or to issue a stop work order.

The CBO has responded in his affidavit herein that the material filed with the application for the Building Permit and the state of its completion was sufficient to satisfy him that it was in order to issue the permit. He states he had personal knowledge of Saunders' ownership of and title to the lands to which the permit applied. Moreover, he indicates that he was subsequently advised by Mr. Weinberg that one of the reasons given for the appeal was that the Comprehensive Zoning By-law was without any force and effect and could not be amended, a position which the Clerk reported "..... may well be correct". It seems that the Comprehensive Zoning By-law had never received approval from the Ministry of Municipal Affairs or the Ontario Municipal Board. The CBO says that he concluded that because the Comprehensive Zoning By-law was unenforceable, Saunders ".... had the right to apply for a Building Permit on his property without any amendment to the [Comprehensive Zoning
By-law]", which dictates zoning conditions, lot areas, and setbacks.

The Weinbergs brought their concern about the issue of the Building Permit to the attention of the Township, by telephoning and finally writing to the Clerk on June 30, 1989, setting out their complaints. In that letter, Mr. Weinberg noted the intention of the Clerk and the CBO ".... to leave it up to [the Township's solicitor] to make the necessary recommendations when Council meets". He requested that his complaints be dealt with on June 6, 1989, at a meeting earlier than the originally scheduled date of July 13, 1989.

In mid-June, Mr. Weinberg noticed construction of a home on the Subject Lands which led to the disclosure of the existence of the Building Permit resulting in the complaint to the CBO. The CBO's inspection notes indicate that on June 12, 1989, he was called to inspect the footing forms, suggesting that the excavation was complete on that date. On July 4, 1989, the house was at the framing stage, and construction was continuing. It is now complete and is occupied by Mr. & Mrs. James Whitton and their three children. in his affidavit herein Saunders states that he entered into an agreement in December 1988, to build a new home and to sell it and the Subject Lands to the Whittons. In argument on this application, however, it was indicated that Mr. Whitton himself purchased the materials needed to build the home which were then paid for by Saunders. Mr. Whitton is also said to have contributed much of his own "sweat labour", suggesting that it was Mr. Whitton who was the principal builder of that home (the "Whitton Home"), and not Saunders.

It is stated by Saunders that the Whittons were under considerable pressure to acquire their new home as they had been given notice to vacate the premises which they were renting.

The Clerk indicates that Notice of a Public Meeting to consider approval of the severances requested by Saunders had been circulated to property owners within 120 meters of the Subject Lands, and served upon all relevant agencies. The Weinbergs did not meet these criteria. No objection was received at that Public Meeting. Saunders, sitting as reeve, declared a conflict of interest and left the Council table before the Zoning Amendment By-law was passed. Notice of passage was circulated to the same persons as were originally notified. These notices apparently satisfy the requirements of the Planning Act. As previously stated, the Weinbergs appealed the Zoning Amendment By-law no later than May 8, 1989.

The Clerk states that the Township's solicitor reported, on June 14, 1989, that the Comprehensive Zoning By-law was "invalid and unenforceable", with the result that in his view, there was no zoning by-law in force in the Township. On July 31, 1989, the Township passed By-law No. 30-1989, (the "Interim Control By-law"), freezing essentially all of the lands in the Township which are not controlled by the Niagara Escarpment Commission.

The Clerk states in her affidavit herein that the Township Council concluded that, because the Comprehensive Zoning By-law was not in force, the Building Permit already issued to Saunders was non-offending. As a consequence, Council concluded it would not revoke it. This decision was communicated to the Weinbergs on or about July 22, 1989. On July 31, 1989, this application was launched.

On September 7, 1989, By-laws Nos. 44-1989 and 45-1989 of the Township were passed. The first of these By-laws exempted the Saunders' properties for which severances had been granted, including the Subject Lands, from the effects of the Interim Control By-law. The second of these By-laws enabled single family residences to be constructed on each of the lots so severed. The Whitton Home was by then completed to a stage suitable for occupancy.

The Weinbergs have now appealed both of the most recent By-laws.

Counsel for the Weinbergs acknowledges that the Weinbergs' concerns about haphazard planning and undue severance activity, the subject matter which prompted their original appeal against the Zoning Amendment By-law, will be addressed in their newest appeals, however, the status of the original appeal is uncertain. Counsel for the reeve is of the opinion that since the Comprehensive Zoning By-law now ceases to exist, matters arising thereunder are now also moot and the OMB will not proceed with the original appeal. Counsel for the Weinbergs has contacted a representative of the OMB who has advised him that it is likely, but not certain, that the original appeal will not proceed. With candour, Mr. Rogers, representing the Weinbergs, has acknowledged that the Weinbergs' present position in the appeal process might be re-inforced by the fact of the two additional appeals. But he points to the fact that the Whitton Home continues to stand and will likely become a lawful non-conforming use in the event that I do not grant the relief now being sought and the Weinbergs' appeal of the Zoning Amendment By-law is not proceeded with or is resolved in some manner not favourable to his clients. Implicit in this is the wish of the Weinbergs that they will control, or be able to require the Township to control, the continued existence of the Whitton Home, (at least within the boundaries of the Subject Lands).

Saunders is of the opinion, stated in his affidavit, that Mr. Weinberg ".... is interested only in embarrassing me as Reeve of the Township of Euphrasia and there is no valid reason for this application other than his feelings of bitterness towards me." He cites a number of reasons and much correspondence in support of his belief of bias.

S. 15 OF THE ACT

Under S. 15(1) of the Act, in order to be successful in this application the Weinbergs must satisfy me that they are properly persons who can consider themselves aggrieved in law. Having failed to make their application within twenty days of the issue of the Building Permit they are precluded from advancing their appeal unless I exercise my discretion to extend the time within which they can proceed. I can only do this, if I am satisfied that there are prima facie grounds to grant the relief they are seeking and that there are reasonable grounds for applying for the extension.

PRIMA FACIE GROUNDS

The existence of prima facie grounds was not vigorously argued by any of the Respondents and I find that they exist. The Building Permit was issued on incomplete and mistaken or false information. Registration of the Subject Lands had not taken place at the time of its issue. The Comprehensive Zoning By-law ostensibly governed the CBO's deliberations, whether or not it was approved by the OMB or the Ministry, until it was revoked or declared unenforceable. Appropriate zoning, intended to be effected by the Zoning Amendment By-law, was stayed by the Weinbergs' appeal. Proper zoning was still unresolved when the Building Permit was issued.

TIMELINESS

This application was filed on July 31, 1989 under S. 15(1) of the Act. It must ordinarily be launched within twenty days of the decision of the CBO (June 12, 1989), to issue the Building Permit. As stated, under S. 15(5), leave to extend can only be granted when there are reasonable grounds for the extension. I consider that such grounds must address the reasons for, and length of, the delay and its consequences upon all parties affected.

Mr. Weinberg, although now engaged in some form of farming, is a retired lawyer. It was conceded that he is a sophisticated

person, and that he was aware of the provisions of S. 15 of the Act. He had engaged eminent counsel to represent him in these various matters. In his letter of June 30, 1989, to the Clerk, Mr. Weinberg referred to his expectation that the Clerk and the Township solicitor would communicate with his lawyer relative to his request that the Township rescind the Building Permit. He was aware, or should have been aware that, since the Act was passed, it became the function of the CBO and not that of the Township Council to control building permits: (McDonald's Restaurant of Can. Ltd. vs. Humm et al. [1984] 24 M.P.L.R. 103 at 124).

While I believe that Mr. Weinberg's decision to do business with the Clerk, the Township solicitor, and Council was reasonable and even appropriate to his assessment of what it might take to cause the CBO to act in the manner Mr. Weinberg was insisting upon, he cannot ignore the fact that time was running against him, calculated from the time of the CBO's decision, and not that of the decision of Council, or of its solicitor.

To the extent that the Weinbergs argue that they are aggrieved by reason of the fact that they have lost their appeal of the Zoning Amendment By-law by reason of the rescission of the Comprehensive Zoning By-law, this application is premature because of the possibility that their appeal may still be heard.

It is the Weinbergs who stated, as their first grounds in that appeal:

> 1. By-law No. 15-1971 enacted by the Council of the Township as a general zoning by-law applying to the entire Township, has never been approved by the Ontario Municipal Board as was required by the Planning Act, RSO 1970, C. 349, S. 35(9) and is therefore without any force and effect and cannot be amended.

It was accepted by all of the parties hereto, and their counsel, that this is an accurate conclusion. Saunders, by reason of his office, is an important person in the Township. A reasonable person might perceive that the manner and haste with which the Township responded to Saunders' problems suggests that his influence, intended or otherwise, did not end when he declared his conflict and left the Council table prior to the enactment of the Zoning Amendment By-law. Notwithstanding this, the logical extension of the reasoning flowing from the invalidity and unenforcibility of the Comprehensive Zoning By-law is that Saunders was entitled to demand the issue of the Building Permit upon completion of the necessary documentation incidental thereto, with or without rezoning.

In City of Ottawa v. Boyd Builders Ltd., [1965] S.C.R. 408 at 410, Spence, J. stated:

> An owner has a prima facie right to utilize his own property in whatever manner he deems fit subject only to the rights of surrounding owners, e.g. nuisance, etc. This prima facie right may be defeated or superseded by rezoning if three prerequisites are established by the Municipality;
>
> (a) a clear intent to restrict or zone existing before the application by the owner for a building permit,
>
> (b) that council has proceeded in good faith, and
>
> (c) that council has proceeded with dispatch.

Many of the principles enunciated in the Boyd decision have no application since the enactment of S. 15 of the Act, however, I am of the opinion that it was not intended that an owner's enjoyment of his own property should be governed by persons who have no higher interest than planning and severance activity within the Township. Certainly I do not perceive that it is reasonable that I should extend the time within which to appeal to persons upon whom the issue of the Building Permit has little or no direct or personal affect.

The evidence is that the Weinbergs:

a) live approximately five miles from the Subject Lands;

b) have no interest in any closer lands;

c) have no structural objection to the Whitton Home;

d) have never been on the Subject Lands, inside the Whitton Home and are not required to pass it in the ordinary conduct of their lives;

e) have no evidence that the Whitton Home is unsafe;

f) do not find it unattractive, being similar to many new residences in the Township;

g) base their application on personal concerns about the planning in the Township, the possible loss of their appeal of the Zoning Amendment By-law, and the continued existence of the Whitton Home in that event.

As previously stated, I am of the opinion that it is necessary for me to consider the effect that an extension of time will have on all parties affected. I am concerned that the Whittons are not before the Court despite the fact that they are the parties most likely to be affected adversely, at least initially, by any order to extend time. There is nothing before me which suggests that the Whittons did not, at all times, conduct themselves in good faith, relying on the Zoning Amendment By-law, the Building Permit, and their confidence in Saunders prior to commencing construction.

It is interesting that Saunders applied for the Building Permit at the home of the CBO. He may have received preferential treatment from the CBO and the Township. It is a fact that he completed his application for the Building Permit when he was aware of the Weinbergs' appeal of the Zoning Amendment By-law, and therefore he mis-stated the zoning in force when he applied for the Building Permit. Nevertheless, Saunders was ultimately acting on the assumption he was entitled to the permit. This was reasonable, and there is no suggestion that there was any bad faith on his part when he acted on that belief.

In Giglio Enterprises Ltd. vs. Edward Link et al. (unreported; released September 8, 1989), Zalev, D.C.J. stated as follows:

It would be intolerable to interpret S. 6(4)(a) of the Act to allow building permits to be revoked where buildings are in good faith constructed pursuant to such permits.

The fact of the completion of the construction of the Whitton Home makes it unreasonable, although not necessarily intolerable, that I should extend the time within which to proceed with this application. The test I must address is reasonableness.

Construction was ongoing from at least June 20, 1989, to the knowledge of the Weinbergs. Construction in the first twenty days following the issue of the Building Permit on June 12, 1989, was carried out with the risk of an appeal, however, thereafter and until July 31, 1989, the consequences of delay were at the risk of the Weinbergs.

Having regard to the fact of this ongoing construction, I am of the opinion that the Weinbergs did not act expeditiously, effectively, or appropriately when they withheld the initiation of their appeal under S. 15(1) of the Act in order to deal with the Township, its Clerk, and its solicitors.

PERSONS WHO CONSIDER THEMSELVES AGGRIEVED

If I had not denied the extension of time I would nevertheless have found against the Weinbergs on the requirement that, in order to proceed with their appeal, they must qualify as persons entitled to consider themselves aggrieved, in law. While this broad language suggests relief will be extended to persons based upon a subjective assessment of the existence of a grievance, this threshold entrance requirement has been more strictly construed. I adopt the test relative thereto as stated by Zalev, D.C.J. in Giglio vs. Link (supra) as follows:

There are many statutes which give a right of appeal to "a person aggrieved". There are many judgments interpreting those words within the context of those statutes. The judgments are remarkable for their inconsistency. Many of them are collected and considered in the judgment of the

Nova Scotia Supreme Court, Appeal Division, in Re Halifax Investments Ltd. and City of Halifax, 90 D.L.R. (3d) 633. The Court held the appellant must have suffered a legal grievance in the sense of having been wrongfully deprived of something or having title to something wrongfully affected.

* * * *

It must be noted that Section 15(1) uses the words "any person who considers himself aggrieved". This must include a class of persons wider than "and person aggrieved", ... it cannot include every person who, for whatever reason, has a personal axe to grind, whether real or fanciful, against the municipal authorities, Building Department, landowner, and those involved in the actual construction. At the very least there must be reasonable grounds for believing oneself aggrieved.

Counsel for the Weinbergs argues both that the Weinbergs have reasonable grounds for believing themselves aggrieved and that they have suffered a legal grievance by the loss of something. He cites the perceived inadequacies in planning, the possibility of the creation of a lawful non-conforming use and the loss of appeal. However, as previously noted, the fact that there will be no hearing of the appeal of the Zoning Amendment By-law is not established, and the planning grievances of the Weinbergs are preserved in, and possibly reinforced by their most recent appeals against By-laws 44-1989 and 45-1989.

In Riverview Heights Ratepayers Menu Foods Ltd. [1980] 14 M.P.L.R. 61 at 67, Shapiro, D.C.J. stated as follows:

There is a further matter for consideration and that is, do the applicants in this case fall within the category of a "person who considers himself aggrieved". Even assuming an individual identity to the ratepayers' association or reading "person" to include "persons" I do not consider that those with some peripheral interest such as the present applicants were in the Legislature's contemplation of aggrieved persons. Within the context of this Act, I think it would refer to people such as builders, architects, engineers, and such who would be directly affected by the issuing or non-issuing of the permit. It would conceivably also include adjoining landowners whose property was threatened with physical damage by say the threatened collapse of an unsafe wall.

As previously stated, it is trite that any statute which fetters or impairs a person's right to enjoy his own property must be strictly construed. This is the case even when the enabling legislation adopts language which is as broad as that contained in S. 15(1) of the Act. The Weinbergs are not directly affected by the Building Permit. As noted, relative to the issue of timeliness, the consequences of the existence of the Whitton Home upon the Weinbergs is remote. As such, the Weinbergs are not persons entitled to consider themselves aggrieved, in law.

COSTS

I have previously dealt with the question of costs in my endorsement in this matter in which I have stated as follows:

Although not prepared to abandon any claim for costs, the Respondent Township and its servant Leuty are not aggressively pursuing costs. I am satisfied that the matters now before me would not be here if the Building Permit Application had disclosed that the zoning amendment was under appeal, and hence the By-law creating the amendment stayed. The onus, in my view was upon the Respondent Saunders to assure the accuracy of that application. In the circumstances, no order as to costs.

Municipal law -- By-laws -- Validity -- Zoning -- Non-conforming use -- Apartment qualifying as legal non-conforming use -- New zoning by-law containing provision purporting to deem legal non-conforming uses to be conforming uses -- Subordinate legislation conflicting with statute -- Deeming provision in by-law ultra vires as interference with statutory protection of legal non-conforming uses -- Planning Act, R.S.O. 1990, c. P.13, s. 34(9).

Planning -- Zoning -- By-law -- Validity -- Non-conforming use -- Apartment qualifying as legal non-conforming use -- New zoning by-law containing provision purporting to deem legal non-conforming uses to be conforming uses -- Subordinate legislation conflicting with statute -- Deeming provision in by-law ultra vires as interference with statutory protection of legal non-conforming uses -- Planning Act, R.S.O. 1990, c. P.13, s. 34(9).

Planning -- Zoning -- Non-conforming use -- Scope -- 16-unit apartment building qualifying as legal non-conforming use -- Owner applying for building permit to convert empty space into additional unit -- Addition of unit within scope of legal non-conforming use -- Planning Act, R.S.O. 1990, c. P.13, s. 34(9).

The applicant owned a 16-unit apartment building in the City of London that was constructed in 1952 in conformity with the then applicable zoning by-law. In 1982, the lands upon which the apartment was located were rezoned, and the apartment became a legal non-conforming use. In 1993, pursuant to By-law Z.-1, the lands were rezoned again, and the new zoning did not list the applicant's apartment use within its permitted uses for the applicant's lands. However, By-law Z.-1 contained a provision that deemed certain legal non-conforming uses to be permitted by and in conformity with the by-law and to be lawful uses; the applicant's apartment was in deemed compliance with the by-law under this provision. In April 1995, the applicant applied for a building permit to convert an empty storage area in the apartment into a one-bedroom unit. This conversion did not require any changes to the exterior of the building, but the Chief Building Official for the City of London refused to issue the permit on the ground that the apartment use was deemed to be a lawful use and to extend this use a minor variance to the zoning by-law was required. The applicant appealed the decision of the Chief Building Official and relied upon s. 34(9) of the Planning Act, which provides that a zoning by-law passed under s. 34 does not prevent the use of land if such land was lawfully used for such purpose on the day of the passing of the by-law, so long as it continues to be used for that purpose.

Held, the appeal should be allowed.

The legal non-conforming use principle, which is given statutory form by s. 34(9) of the Planning Act, provides a limited form of protection to vested property rights. Section 34(9) exempts lands lawfully used from the operation of a new zoning by-law. The deeming provision in By-law Z.-1 was ultra vires the authority of the City because it derogated from the applicant's statutory rights under s. 34(9) of the Act and because there was a substantial operational disunity and inconsistency between the by-law, which is a subordinate instrument, and the Planning Act, which was its parent statute. The deeming provision of the municipal by-law was repugnant and inconsistent with the statutory provision with which it could not stand side by side.

The deeming provision in By-law Z.-1 not being operative, the applicant's rights to convert the empty storage area into an additional unit depended upon the scope of its non-conforming use, which the City characterized as a "16-unit apartment

building". This, however, was not a correct characterization. It is not necessary that the entire building be used for the legal non-conforming uses. The statutory exemption from the new by-law is not to the existing use as such but to the building itself. In this case, the addition of one more unit to the applicant's apartment building was within the range of the established non-conformity, and the building permit should be issued.

APPLICATION under s. 25(1) of the Building Code Act, 1992, S.O. 1992, c. 23, seeking an order directing the issuance of a building permit.

Barry R. Card, for applicant.
James P. Barber, for respondent, City of London.

KILLEEN J.: -- This is yet another in the seemingly endless and inexhaustible series of cases dealing with the zoning principle of legal non-conforming use. Here, the applicant 382671 Ontario Limited ("382671") brings an application under s. 25(1) of the Building Code Act, 1992, S.O. 1992, c. 23, seeking orders, (1) rescinding the decision of Rocco Cerminara, the London Director of Building Controls, to reject the applicant's application for a building permit, and (2) directing that Mr. Cerminara issue a building permit for the conversion of certain unused space in an apartment building into an apartment dwelling unit as requested in building permit application No. 9501104.

The Background Facts

There is not a shred of dispute about the facts of this case.

382671 is the owner of a 16-unit apartment building located at 100 Barton Street in London. The apartment building has three floors with the lower floor being partially below ground level.

The building was constructed in 1952 and, at that time, complied with the applicable zoning by-law.

In 1949, By-law C.P. 65-233 provided for multi-family residence zones permitting a "multiple dwelling" which, under the by-law, was defined as "a building containing three or more dwelling units" and an "apartment house". The building at 100 Barton Street has contained 16 apartment units from the date of its construction to the date of the application for the building permit on April 10, 1995.

The definition of multiple dwelling was changed in 1958 and the use described as an "apartment house" was deleted and the term "apartment building" was substituted in its place.

There were several consolidations of By-law C.P. 65-233 throughout the 1960s and 1970s, but it would seem that each maintained a multi-family residence zone in which apartment buildings were permitted and regulated based upon the number of dwelling units in the given building.

By-law C.P. 1000.-21 was passed on December 7, 1981, and received Ontario Municipal Board approval on November 29, 1982,
such approval to be effective from January 1, 1982.

This by-law rezoned the lands at 100 Barton Street as an R4/ R7 composite zone. Neither the R4 nor the R7 zones permitted an apartment building. The by-law defined apartment buildings based on the number of dwelling units in the building, as had its predecessor by-laws in the 1960-1980 period.

The number of dwelling units in 100 Barton Street exceeded the permitted number under the permitted uses in the R4 or R7 zones of By-law C.P. 1000.-21 so that it may be said that, when this by-law was passed, 100 Barton Street acquired the status of a legal non-conforming use.

By-law Z.-1 was enacted by the city on May 21, 1991, and came into force with respect to the subject property on July 1, 1993, under an order of the Ontario Municipal Board. This comprehensive general zoning by-law rezoned the area where 100 Barton Street was located as an R3-1/0C2 zone. Neither the R3-1 nor the 0C2 zone permits apartment buildings.

The permitted uses in the Barton Street area are set out at s. 7 of the by-law. They are all essentially residential uses:

7.2 PERMITTED USES

No person shall erect or use any building or structure, or use any land or cause or permit any building or structure to be erected or used, or cause or permit any land to be used in any Residential R3 Zone for any use other than the following uses:

a) Single detached dwellings;

b) Semi-detached dwellings;

c) Duplex dwellings;

d) Triplex dwellings;

e) Converted dwellings;

f) Fourplex dwellings.

Each of these permitted uses is carefully defined in s. 2, the definitions section of the by-law. In s. 2(122) we find the drafter undertaking the Herculean task of providing multiple subdefinitions of the many kinds of "dwellings" which are referred to throughout the by-law. For example, in s. 2(122)(a) we find this definition for apartment building:

a) "APARTMENT BUILDING" means a residential building containing four or more dwelling units to each of which access is obtained through a common entrance or entrances from the outside and through a corridor or hallway from the inside.

A somewhat unique feature of By-law Z.-1 is that it contains a special proviso which attempts to "deem" certain legal non-conforming uses to be lawful on and after July 1, 1993, the effective date of the by-law. Section 1.3 says this:

1.3 DEEMED CONFORMITY OF USES AND COMPLIANCE WITH REGULATIONS

(1) Where any land, building or structure was lawfully used on the 30th day of June, 1993 for a purpose that, were it not for this provision, is prohibited by this By-law, that use is hereby deemed to be permitted by and in conformity with this By-law, despite anything in this By-law to the contrary, so long as the land, building or structure is used and continues to be used for that purpose.

(2)(a) Where any land, building or structure has been

> continuously used from the 1st day of July, 1973 until the 30th day of June, 1993 for a purpose that is prohibited by this By-law, that use is hereby deemed to be a lawful use on the 30th day of June, 1993.

As I have already noted, 382671 filed its application for a building permit on April 10, 1995. It was seeking to convert an unused and empty storage room area on the lower floor of the building into a one-bedroom apartment. The application and its attachments clearly show that the conversion would be done without any changes to the exterior of the building. Not even the windows in the proposed area were to be changed; all that was going to happen was that an unused or under-utilized area was going to be converted into one more apartment unit for the building.

The response to the building permit application was negative and came some months later in the form of Mr. Cerminara's letter of January 2, 1996, reading as follows:

> Dear Sir:
>
> Re: 100 Barton Street, London ON Application No. 9501104
>
> Further to your discussions with Brace Henry this letter will confirm that the Chief Building Official can not issue the permit for an additional dwelling unit because the issuance would be contrary to applicable law namely the Zoning By-law.
>
> The existing apartment building with 17 apartments has been in existence for a number of years. Our understanding is that the use of the building for 17 apartments has been continuous between July 1, 1973 and July 1, 1993 and by virtue of Section 1.3.(2)(a) of the Zoning By-law (see copy attached), the use of the building is deemed to be a lawful use. It is our opinion that if the owner is to extend this use by adding an additional dwelling unit, then a minor variance to the Zoning By-law is required.

As can be seen, Mr. Cerminara relies on the new deeming provision of the by-law -- s. 1.3.(2)(a) -- to defeat the applicant's attempt to rely on its legal non-conforming use rights.

The Issues and their Resolution

The nerve centre of the argument presented by Mr. Card for the applicant may be found in s. 34(9) of the Planning Act, R.S.O. 1990, c. P.13:

> 34(9) No by-law passed under this section applies,
>
> (a) to prevent the use of any land, building or structure for any purpose prohibited by the by-law if such land, building or structure was lawfully used for such purpose on the day of the passing of the by-law, so long as it continues to be used for that purpose . . .

The history of s. 34(9) and its statutory predecessors have been well and thoroughly reviewed in Rogers' Canadian Law of Planning and Zoning, (1973) at pp. 210.20-.56 and needs no repetition here in detail. Suffice it to say that the legal non-conforming use principle was given statutory form in Ontario and elsewhere to provide a limited form of protection to vested property rights in the teeth of the necessary zoning powers of local governments to control the orderly development of municipal lands in the light of ongoing and constantly changing circumstances.

Without this protective principle, the local landowner would be at the mercy of the passing whims and fancies, as well as the reasoned planning and zoning judgments, of local officials and could face indirect expropriation or forfeiture without compensation. Thus, the non-conforming use principle has been statutorily embedded in the zoning process to prevent retroactive injustice from being wreaked upon the landowner.

In Ontario, then, lands and buildings are excepted from the operation of a zoning by-law if they were lawfully used for a purpose prohibited by the by-law on the date of its passing. Section 34(9)(a) says simply that no by-law is to apply to prevent the use of any such land or building.

Reduced to its basic points, Mr. Card's argument on behalf of

the applicant may be summarized as follows. First, he submits that his client's original use of its land for an apartment building from 1952 onward to 1980 or so was a lawful use. Second, that use became a legal non-conforming use within the predecessor proviso to s. 34(9) and fell within the protective features of that statutory principle. Finally, he argues that the deeming proviso of s. 1.3 of By-law Z.-1, under which the city has attempted to convert certain legal non-conforming uses into lawful uses, is ultra vires the city because it derogates from the statutory rights of the applicant and other similarly situated landowners under s. 34(9) of the Planning Act. Clearly, he argues here, a municipality cannot, by by-law, amend and eviscerate the important non-conforming use principle which is, after all, embedded in the parent legislation under which the municipality's zoning power is created.

Mr. Barber, for the city, developed two basic arguments in response to the applicant's position.

First, he argued that new s. 1.3 of By-law Z.-1 was essentially a benevolent extension or adjustment of the legal non-conforming use principle and was not inconsistent with it. Thus, it could be held to be intra vires the municipality as a legitimate attempt to smooth out the local zoning field and provide a more level and consistent playing field for city planners and landowners alike. Second, he argued that, in any event, the relevant decisional law under s. 34(9) of the Act does not, on close analysis, permit the applicant to add an apartment unit to the apartment building without recourse to the "minor variance" process provided for in s. 45(2) of the Act.

A. The vires of s. 1.3 of By-law Z.-1

In my view, s. 1.3 of By-law Z.-1 is nothing more nor less than a clever attempt by the municipality to trench upon and even disembowel s. 34(9) of the Act.

It must be remembered that s. 34 of the Act provides the basic life support system for the enactment of all zoning by-laws across Ontario. Section 34(1) starts out by saying that "[z]oning by-laws may be passed by the councils of local municipalities . . .". Following upon that opening language, s. 34(1) then includes six broad paragraphs which outline the general parameters of the zoning powers granted to municipalities. As I have already noted, s. 34(9) is a central element in the zoning-power structure and has been included to protect property owners against inevitable retroactive zoning changes down through the years which could otherwise put a given property or building at risk of disastrous economic dislocation.

To me, there is a substantial measure of operational disunity and inconsistency between the by-law proviso of the subordinate instrument and the protective proviso of the parent statute such that the by-law proviso must fall. If the municipality wishes to obtain the power set out in the by-law, it must seek out an amendment to s. 34(9) itself and not take it upon itself to amend the statute through the subtle but illegal sleight-of-hand device set out in s. 1.3.

The leading Ontario case on the question of repugnancy or inconsistency between a statutory proviso and a municipal by-law is Ontario (Attorney General) v. Mississauga (City) (1981), 33 O.R. (2d) 395, 124 D.L.R. (3d) 385 (C.A.). There, the court had to deal with an alleged repugnancy between a municipal by-law prohibiting the storage or burning of chlorinated carbons and certain provisions of the Environmental Protection Act, R.S.O. 1980, c. 141. The judgment of the court was written by Morden J.A. He said this about the issue at hand at pp. 409-10:

> Is there a conflict between By-law 731-79 and the Environmental Protection Act, 1971 of the kind which would render the By-law 431-79 inoperative? I do not intend to review the extensive jurisprudence in which various tests have been formulated and applied in resolving the issues of conflict, or of inconsistency, repugnancy or incompatibility. In my view, if the competing pieces of legislation are intended to advance the same policy and the provision in the statute covers the same ground as the by-law in a way to give rise to the interpretation that the statutory provision is intended ". . . completely, exhaustively, or exclusively [to express] what [shall be] the law governing the particular

conduct . . . to which its attention is directed . . .", then there is a case of conflict. I quote from Ex parte McLean (1930), 43 C.L.R. 472 at p. 483, which was adopted in O'Sullivan v. Noarlunga Meat Ltd., [1957] A.C. 1 at p. 24, and quoted in R. v. Morin (1965), 52 D.L.R. (2d) 644 at pp. 646-7, [1966] 1 C.C.C. 265, 53 W.W.R. 234. If, in covering the same ground the subordinate legislation works at cross purposes to the provincial statute, then the case for conflict is reinforced. This is not intended to be an exhaustive definition of a conflict which will result in the rendering inoperative of the subordinate legislation but merely as one instance thereof and one which, in my view, is applicable to the case.

Morden J.A. was, of course, dealing with a conflict problem between a separate statute -- the Environmental Protection Act -- and a by-law enacted under the Municipal Act. In the case at bar, on the other hand, I am faced with an alleged clash between a provision in the parent statute -- the Planning Act -- and a zoning by-law enacted under the very section -- s. 34 -- which enables the municipality to pass zoning regulations. Nevertheless, the principle which he propounds of "operative conflict" (see passage at p. 407) strikes me as being peculiarly applicable to the case at bar.

As I read the two provisos, they cannot live side by side because, incontestably, the by-law proviso strikes at the heart of the statutory right. This, the municipality cannot do with subordinate legislation.

B. The scope of the non-conforming use

Mr. Barber has argued that, even if By-law Z.-1 is inoperative, the applicant cannot convert the unused space into a 17th apartment under the non-conforming use principle, as the principle has been explicated in the case-law. Essentially, he was saying here that the non-conforming use which was created under the 1981 by-law was a "16-unit apartment building" and that the applicant cannot, as of right, construct or add a 17th unit in virtue of s. 34(9).

The well-spring of the case-law explicating the doctrine of legal non-conforming use is found in the well-known case of Central Jewish Institute v. Toronto (City), [1948] S.C.R. 101, [1948] 2 D.L.R. 1.

In this case, the institute entered an agreement on June 27, 1946, to buy a large residence on Avenue Rd. in the City of Toronto for use as a progressive school for young children. The closing and possession date for the transaction was originally fixed for September 1. The vendor had been using the property as a rooming-house with several lodgers.

The city council, in response to lobbying efforts from local residents who were opposed to a school, quickly passed a zoning by-law restricting the use of area lands to single-family residences and related uses.

However, before the actual passing of the by-law, the vendor and institute had, on July 12, amended their agreement to allow the institute into possession on July 15, but reserving the right to the vendor and his lodgers to stay in occupation on a phase-out basis over the summer.

On July 15 three teachers and a number of young students went on the property and, for the balance of the summer, a modest part of the premises was operated as a summer nursery school of sorts. There is no doubt that the institute occupied the premises on this partial basis in an attempt to establish a legal non-conforming use.

In 1946, the non-conforming use proviso was set out in s. 406(2) of the Municipal Act, R.S.O. 1937, c. 266, as amended, and read as follows:

406(2) No by-law passed under this section shall apply to any land or building which, on the day of the passing of the by-law, is used or erected for any purpose prohibited by the by-law, so long as it continues to be used for that purpose . . .

While this language is a little different from the language of current s. 34(9) of the Planning Act, there is no difference in substance or effect. This fact is conceded by Mr. Barber.

The judgment of the court was written by Kerwin J. Rand and Kellock JJ. wrote concurrences but, if anything, their concurrences are stronger, in effect, than the judgment of Kerwin J.

The Supreme Court reversed the concurrent holdings of the trial court and Ontario Court of Appeal and concluded that the institute had established a legal non-conforming use through its partial and limited use of the residence in the short period between July 12, the changed date of possession, and the passing of the zoning by-law on July 24, a matter of 12 days later.

As Kerwin J. said at pp. 105-06 of the judgment:

> It is not necessary that the entire premises, that is every room in the building, be used. While a bona fide intention to use is not sufficient, as has been decided by the Judicial Committee in Toronto Corporation v. Roman Catholic Separate Schools Trustees [[1926] A.C. 81], it is an important element in considering the evidence as to actual user. There is no doubt, in the present case, as to the purpose of the appellant in purchasing the premises nor, I think, is there any real doubt on the evidence as to what it did. This is not a case of disturbing concurrent findings but of accepting the facts as found and of drawing the proper legal conclusions therefrom. The appellant took steps during the summer vacation, in an endeavour to bring itself within subsection 2 of section 406 of the Act and, in my opinion, has succeeded in so doing. It actually used the premises as a school and the mere fact that it was a nursery summer school does not prevent the appellant increasing the number of pupils or enlarging the scope of its activities so as to conduct classes not in operation at the relevant time. We are not concerned, in the present appeal, with any question of erecting new buildings.

(Emphasis added)

Mr. Justice Rand, in his concurrence, goes into more detail than Kerwin J. in describing the effect of old s. 406(2). At p. 109 he describes the effect of the subsection as creating an "exemption" from the new by-law:

> It will be seen that the exemption is not to the existing use but to the building; and there is no implication that it is the whole of the building that must be so used or that the use must be the sole use. The language would be satisfied by a partial use as if, for instance, an owner was carrying on a grocery store on the ground floor and using the second storey for his home: could it seriously be questioned that the use of the lower floor in such a case would be protected by the exemption? If that same business were extended to the upper storey, could it be said that the exemption did not continue or was lost? The building would still be used on the ground floor for the prohibited purpose; the building as a whole would be exempt; and I think it would necessarily follow that no such extension could bring about a forfeiture of the exemption. In any case the question is whether a real use, in good faith, is being made of the building, a use not merely incidental to some other use, but possessing an individuality of its own.

Mr. Justice Kellock reinforces what was said by his colleagues in the following passage at p. 113:

> I agree with the view of the statute taken by my brother Rand that the use being made of the building here in question on the day of the passing of the by-law was sufficient to bring it within the very words of section 406(2) and as the building and the lands appurtenant were being used by the appellant for a purpose not permitted by the by-law, the by-law does not apply to them.

As I read the three strong judgments in Central Jewish Institute, nothing could be clearer than what they have said about the effect of a new zoning by-law on the use or uses of a legal non-conforming building: It is not necessary that the entire premises be used. This is because the statutory exemption from the new by-law was not to the existing use per se, but to the building itself. In effect, the whole of the existing building was thereby exempt from the zoning by-law.

There are at least four judgments in Ontario (and many elsewhere across Canada) which usefully address the full ramifications of the holding in Central Jewish Institute. They are O'Sullivan Funeral Home Ltd. v. Sault Ste. Marie (City), [1961] O.R. 413, 28 D.L.R. (2d) 1 (H.C.J.); Thorman v. Cambridge (City) (1977), 18 O.R. (2d) 142, 4 M.P.L.R. 220 (H.C.J.); Haldimand-Norfolk (Regional Municipality) v. Copland (1992), 12 M.P.L.R. (2d) 85, 96 D.L.R. (4th) 443 (Ont. Gen. Div.) and Magdalena's Rest Home Ltd. v. Etobicoke (City) (1992), 12 M.P.L.R. (2d) 316 (Ont. Gen. Div.).

It is unnecessary to review the factual circumstances of all of these cases. They all dealt with situations where, essentially, an owner attempted to enlarge or expand a legal non-conforming use. After careful analysis of Central Jewish Institute, each court held that the owner could expand the non-conforming use within the confines of the entire building without the necessity of conforming with the dictates of the new zoning by-law.

Magdalena's Rest Home gives the flavour of all these cases. There, the owner operated a rest home in a residential zone. Before the passage of the first zoning by-law for the area, the lands were used as a 15-bed rest home. The municipality later passed a zoning by-law which allowed specified residential uses only, and a rest home was not within the list of permitted uses. The applicant sought to expand the number of beds to the maximum permitted under certain health and licensing regulations. The proposed expansion could be accomplished internally without any extension of the building.

The municipality argued that the legal non-conforming use protected only the exact status quo ante of 15 beds and submitted that any expansion called for relief from the zoning by-law either through an application to the Committee of Adjustment for a minor variance or to council for an amendment to the zoning by-law itself.

The argument presented by the municipality in this case is paradigmatic of the arguments of many municipalities across Ontario since Central Jewish Institute was decided in 1948. The argument was made that a narrow view should be taken of the term "use", ignoring the fact that the phrase employed in s. 34(9) and its predecessors is "use . . . for any purpose prohibited by the by-law . . .".

In this case, the municipality attempted to seize upon the phrase "15-bed rest home" as a mantra and thereby freeze the building in a strait-jacket.

On the other hand, the owner argued -- and successfully -- that the number of beds was merely a reflection of the intensity of the use and did not represent a different use.

Mr. Barber, during his argument for the city, relied heavily on a decision of the Ontario Court of Appeal in R. v. Grant (1983), 23 M.P.L.R. 89.

Grant was a case where the building had been used for two self-contained dwelling units before a zoning by-law was passed which only permitted a private detached dwelling-house or a converted dwelling-house. Later, the owner quietly increased the number of dwelling units from two to four without making any changes to the exterior aspect of the building. As a result, the city prosecuted the owner for breach of the zoning by-law. The trial judge acquitted, purporting to follow Thorman v. Cambridge, supra, but, in the Court of Appeal, this decision was overturned and a conviction entered.

Mr. Justice Cory, for the Court of Appeal, said this about the scope of the legal non-conforming issue at hand at p. 92:

> What was the nature of the non-conforming use in January, 1960? It was the existence of the two self-contained dwelling units in 12 Playter Blvd. It was no more than that. The existence of the non-conformity did not give rise to a right to increase significantly the extent of that non-conformity. The R. 1 zoning delineated by the by-law was designed to control the density of population in the area. To permit the doubling of the number of self-contained units within the dwelling house flies in the face of the intent and purpose of the by-law. If this increase were permitted, there would be no basis for restricting or controlling by means of the by-law an increase to 10 or 12 units within the exterior

walls of the dwelling. The unauthorized use permitted by the Planning Act was to maintain two self-contained dwelling units within the premises. It should not be extended beyond that limit. To do so would make a mockery of zoning by-laws and unduly extend non-conforming uses.

It is interesting to note that Cory J.A. did not, in so ruling, purport to reject the Thorman decision but only distinguished it on its facts. In referring to a passage in the Thorman decision he said this at pp. 92-93:

> That statement cannot be taken as a blanket authority for multiplying the number of self-contained dwelling units without restraint so long as the external walls are not altered. Rather, the decision was based upon planning concepts for it was pointed out that a separate apartment was a higher and more desirable use than a butcher shop in an area zoned for detached single family residential use. The decision permitted a reasonable use of space in a portion of a building that had become vacant as a result of the abandonment of the butcher shop.

There are two difficulties with Mr. Barber's heavy reliance on the judgment of Cory J.A. in Grant.

First, it may be fairly said, I think, that Cory J.A. is not saying that a building use can never be expanded or enhanced beyond its precise non-conforming status at the date of the passing of the zoning by-law which creates the non-conformity. Rather, he appears to be saying that any such enhancement must be done reasonably, with restraint, and consistently with fair generic range of the established non-conformity.

I must conclude, on the facts before me, that that is precisely what the applicant was attempting to do in utilizing unused space for an additional apartment unit.

Second, it must also be said that nowhere in his reasons does Cory J.A. mention the all-important judgment of the Supreme Court in Central Jewish Institute. I am bound to say there is language in Grant which seems to be at odds with the Central Jewish Institute decision. While the conflict may be more a matter of appearance than reality, I must, of course, follow Central Jewish Institute and conclude that the applicant's building is exempt from the constraints of the city's zoning by-laws and may proceed with the construction of an additional apartment as requested.

Accordingly, orders will go declaring that, (a) the decision of the chief building official should be rescinded, and (b) a building permit should forthwith issue.

It would seem to me that the applicant should have its party-and-party costs but, if counsel wish to argue this question, I may be spoken to.

Before concluding this judgment, I would be remiss if I did not express my gratitude to counsel for their most helpful and candid arguments. Also, I would like to pay homage to a brilliant, scholarly article on the broad subject of legal non-conforming uses written by Ira Kagan under the title of "But I Do Not Want To Be Legal", published at (1993), 13 M.P.L.R. (2d) 252. This article should quickly become an essential research source for any practitioner, judge or legal scholar interested in the subject at hand.

Appeal allowed.

R. v. 593288 Ontario Ltd.

Between
Her Majesty the Queen, respondent, and
593288 Ontario Limited and Riccardo Di Giuseppe, appellants

[1998] O.J. No. 5670
DRS 99-07931

Ontario Court of Justice (Provincial Division)
Newmarket, Ontario
Lampkin Prov. J.
Oral judgment: December 18, 1998.

Counsel:
R. Duncan, for the Crown.
B. Olmstead, for 5943288 Ontario Limited.
N. Gerry, for Riccardo Di Giuseppe.

[para1] LAMPKIN PROV. J. (orally):-- The appellants 593288
Ontario Limited and Riccardo Di Giuseppe appeal against findings of guilt in respect of the following charges:

1. that on the 12th day of September, 1995, at 10097 to 10101 Yonge Street, being lots 22 to 23 of Plan 7032, in the Town of Richmond Hill, they committed the offence of constructing or causing to be constructed a building in a municipality without first obtaining a permit issued therefor by the chief building official for the Town of Richmond Hill, contrary to the Ontario Building Code Act, s. 8(1); and

2. that on the said date at the said place, they committed the offence of failing to comply with an order to comply issued on the 22nd day of June, 1995, by Morris Luchetta, a building inspector for the Town of Richmond Hill, contrary to the Ontario Building Code Act, s. 12(2).

FACTUAL BACKGROUND

[para2] Riccardo Di Giuseppe is the president of 593288 Ontario Limited which has its registered office at 10097 Yonge Street, Richmond Hill. The corporation is the owner of lots 22 and 23 of Plan 7032, Town of Richmond Hill, municipally known as 10097 to 10101 Yonge Street, Richmond Hill.

[para3] On June 21, 1995, there was a fire in the basement of the Major Mack Hotel which forms part of the premises comprising 10097 to 10101 Yonge Street. In the aftermath of the fire Paul Schuster, the fire prevention captain of the Richmond Hill Fire Department, inspected the premises in his official capacity.

[para4] Mr. Schuster is also a building code inspector under the Building Code Act for the Town of Richmond Hill. In the course of his inspection he entered into that part of the premises municipally known as 10099 Yonge Street. The Major Mack Hotel is immediately south of 10099 Yonge Street.

[para5] Immediately inside the entrance of 10099 Yonge Street, Mr. Schuster observed much drywall work partially completed. He said the work was obviously in progress. He observed further that much electrical wiring had been strung out from boxes behind a bar which he believed had been newly constructed and appeared to be blocking one of the exits. Progressing further into the building, Mr. Schuster observed stairs leading up to a mezzanine area and the whole area appeared to be partially completed. He saw no one working in the premises.

[para6] The last time Mr. Schuster had been in those premises, 10099 Yonge Street was a retail outlet called Tent City. That was some six or seven years prior to June, 1995. He knew not when Tent City had moved out of the premises. He had no records or drawings to show what Tent City looked like when it was there but he saw changes from what he had seen six or seven years before. He therefore reported his observations to Mike Leonard, a supervisor of the inspection branch of the Town of Richmond Hill.

[para7] Morris Luchetta, a senior building inspector for the Town of Richmond Hill, had visited 10099 Yonge Street on June 13, 1995. He found no one present and was unable to gain access to the premises. The front of the premises had been glazed over and he was unable to ascertain whether construction had taken place, which was the purpose of his visit. He left his business card in the door.

[para8] He returned to the premises on June 22, 1995, but found them locked and was unable to gain access. He had received instructions from his manager that construction was taking place and he therefore posted an "Order To Comply" by taping it to the front door. Copies of the said order were also forwarded by registered mail to the registered office of 593288 Ontario Limited and to Riccardo Di Giuseppe at their respective addresses shown on the corporate documents of the said corporation. The relevant part of the Order To Comply is as follows:

> To:
> Contravenor: Riccardo Digiuseppe (sic)
>
> and to:
> Owner: 593288 Ontario Limited
>
> Project Location:
> Address 10097-10101 Yonge Street,
> Lot 22/23 Plan 7032
>
> An inspection of the property/building at the above location has disclosed the following contravention(s) of the Building Code Act.
>
> You are hereby ordered to correct the contravention(s) set out below immediately/or by: forthwith
>
> Failure to comply with this Order within the prescribed time may result in further action being taken under the Building Code Act and the Provincial Offences Act.
>
> Building Code Reference: Building Code Act Sect. 8(1)
>
> Nature and Location of Contravention: Construction has proceeded at the above premises prior to obtaining a Building Permit.

[para9] On July 4, 1995, Mr. Luchetta, accompanied by Mr. Dave Potter, the chief building official, and Mr. Noel Gerry, who appeared as counsel for the corporation at trial but as counsel for Mr. Di Giuseppe on the appeal, attended the premises and was able to gain access thereto. (I note in passing that Mr. Olmstead appeared as counsel for Mr. Di Giuseppe at trial but as counsel for the corporation on the appeal). Mr. Luchetta saw two or three workmen doing work with drywall compound which may have been patching a wall and which does not require a building permit.

[para10] Mr. Luchetta had last been in those premises in 1988 or 1989 when it was Tent City. He went as a customer to make a purchase. He observed vast changes from when he had been there. Most of the interior partitions had been removed. Stairways, which were not there before, had been installed leading to a mezzanine or a second floor. The Building Code requires a permit to install new stairways as well as to demolish walls in premises. Electrical work appeared to be in progress. Cables were hanging out of boxes. None of the plugs and switches were installed.

[para11] Mr. Luchetta returned to the premises on the 19th and 20th days July, the 15th day of August and on the 11th day of September. There was no one present on any of those occasions and he was unable to gain access. No one had been in touch with him in an attempt to obtain a Building Permit in respect of the premises. There was no compliance with the Order. Proceedings were launched on September 21, 1995.

[para12] Following the dismissal of a non-suit motion at the completion of the Crown's case, the defence called Mr. Franco Vatalaro, the public relations officer of the defendant corporation. He also oversees the general cleaning of the premises. He has been in that part of the premises formerly known as Tent City several times. He testified that since he started working for the corporation in September, 1994, there has not been any construction done to the premises. No

stairways have been built, bars added or rooms or walls demolished. The premises are in the same condition as when he started to work there and look like a giant empty warehouse. The only work done in the premises was some cleaning and painting.

SUBMISSIONS AND LEGAL ISSUES

[para13] The appellants appeal against the findings of guilt on the following grounds:

1. The Justice of the Peace erred in determining that the construction which was the subject of the Order to Comply did require a building permit pursuant to the Building Code Act;

2. The Justice of the Peace erred in not applying Section 36(8) of the Building Code Act;

3. The Justice of the Peace erred in finding that construction as defined under the Building Code Act had occurred within 1 year of the laying of the charge;

4. The Justice of the Peace erred in misapplying Section 36(1(a,b)) of the Building Code Act in finding that the Landlord caused the construction which contravened the Act;

5. The Justice of the Peace erred in finding that the appellants were obligated to comply with an Order to Comply when the appellants were not responsible for the construction alleged.

[para14] On behalf of the corporation, Mr. Olmstead submitted that the only time frame that is of relevance in these proceedings is between June 22, 1995, the date of the posting of the order to Comply, and September 12, 1995, when it is alleged that the defendants effected the construction without a building permit. He concedes that there was construction but submits that there is no evidence to prove that there was construction during the relevant time frame referred to above. Mr. Olmstead submitted further that there is no evidence when the construction commenced and the most the prosecution can say is that there was some construction between 1988 or 1989, when the premises were occupied by Tent City and Messrs. Schuster and Luchetta were both last in the premises, and 1995 when they returned. There is at least a veiled suggestion that the premises were left in that condition when Tent City vacated them and the owner has done nothing to them since that time except perhaps to clean same and patch walls. He submits that there is a one year window within which proceedings must be bought and on the evidence the proceedings are statute barred. Mr. Olmstead further submits that the Justice of the Peace failed to address the evidence of Mr. Vatalaro and that she put the onus on the defence to bring forward a title search to prove that Tent City was the owner, presumably when the construction was done and left by them.

[para15] On behalf of Mr. Di Giuseppe, Mr. Gerry submits that the Building Code fixes liability on a director only where it is proved that the director knowingly fails to comply with an order or otherwise contravenes the Act. He submits that mens rea is required and there is no evidence that Mr. Di Giuseppe had a guilty mind.

[para16] On behalf of the Crown, Mr. Duncan submits that the proceedings were brought within the one year limitation period. He submits that the subject matter of the proceedings arose when the Municipality first learned of the construction without a building permit, that is, on or about June 21, 1995, and not some time before when the walls were demolished and the stairs built. He submits that while a Municipality would be aware of the construction of a new building, it would not necessarily be aware of any interior construction in an existing building as is the case at bar and it is only when that knowledge comes to the notice of the Municipality that the subject matter of the proceeding arises. He relies on Peixeiro v. Haberman, [1997] 3 S.C.R. 549, and Agounie v. Galion Solid Waste Material Inc. et al., (1998), 38 O.R. (3d) 161. He submits that there is nothing in s. 8 of the Act which suggests that the proceedings must be brought within a year of the actual construction taking place. He submits

further that since the appellants have now conceded that there was construction of the premises, the owner is required to obtain a permit to carry out such construction. He submits that the director of a corporate owner, having been served with an Order to Comply and having taken no steps to do so, must be deemed to know that construction is under way in the building of which he is a director and is therefore liable.

[para17] In reply Mr. Olmstead submits that the information charging his client refers to an allegation that his client constructed or caused to be constructed a building on September 12, 1995, and there is no evidence to that effect.

RELEVANT LEGISLATION

[para18] The sections of the Building Code Act which have a bearing on this case are as follows:

> 8. (1) No person shall construct or demolish a building or cause a building to be constructed or demolished unless a permit has been issued therefor by the chief building official.
>
> 12. (2) An inspector who finds a contravention of the Act or the building code may make an order directing compliance with this Act or the building code and may require the order to be carried out immediately or within such time as is specified in the order.
>
> (3) The order shall be served on the person whom the inspector believes is contravening this Act or the building code.
>
> (4) The order shall contain sufficient information to specify the nature of the contravention and its location.
>
> (5) The inspector may post a copy of the order on the site of the construction or demolition.
>
> 27. (1) A notice or order required by this Act to be served may be served personally or by registered mail to the last known address of the person to whom notice is to be given or to that person's agent for service.
>
> (2) If a notice or order is served by registered mail, the service shall be deemed to have been made on the fifth day after the day of mailing unless the person to whom the notice or order is given or that person's agent for service establishes that, acting in good faith, through absence, accident, illness or other unintentional cause, the notice was not received until a later date.
>
> 36. (1) A person is guilty of an offence if the person,
>
> (b) fails to comply with an order, direction or other requirement under this Act; or
>
> (c) contravenes this Act, the regulations, a by-law passed under section 7 or a condition imposed under section 9.
>
> (2) Every director or officer of a corporation who knowingly concurs in the furnishing of false information, the failure to comply or the contravention under subsection (1) is guilty of an offence.
>
> (8) No proceeding under this section shall be commenced more than one year after the time when the subject-matter of the proceeding arose.

[para19] Whether these proceedings are statute barred or not depends on what has come to be known as the "discoverability rule". The rule seems to have been first articulated by Lord Reid in Cartledge v. E. Jopling & Sons Ltd. [1963] A.C. 758 when he said at p. 772:

> It appears to me to be unreasonable and unjustifiable in principle that a cause of action should be held to accrue before it is possible to discover any injury, and

therefore before it is possible to raise any action.

The rule is now firmly part of Canadian law: see Peixeiro, and Agounie, supra. In the latter case the Ontario Court of Appeal held that the rule is a rule of general application and applies to all cases in which a limitation period applies. It was held that there is no principled reason why the rule does not apply to s. 61(4) of The Family Law Act which enacts as follows:

> No action shall be brought under subsection (1) after the expiration of two years from the time the cause of action arose.

The language of the subsection is remarkably similar to that of s. 36(8) of the Building Code Act. I can see no reason why the rule should not apply to regulatory offences. I am bolstered in my opinion by the judgment in Sparham-Souter v. Town and Country Developments (Essex) Ltd. [1976] 1 Q.B. 858,
in which the rule was relied on. The facts are as follows:

> In 1964 a council, in the exercise of their duty to control building in their area under the Public Health Act 1936, passed plans prepared by builders developing a new housing estate. Work started in December 1964, and was completed in September 1965. Before and during the work the council carried out inspections as required by the by-laws made under the Act, and on December 15, 1965, the council issued certificates stating that the plots had been inspected and they had found no reason to question the legality of the work.
>
> On October 25 and November 29, 1965, the plaintiffs contracted with the builders to buy two adjoining houses which were conveyed to them on November 12, 1965, and January 26, 1966, respectively. Some time after they had moved in, faults developed in the houses and cracks appeared in the brickwork. On October 22, 1971, the plaintiffs issued a writ alleging negligence by the builders and also by the council, as a result of which they claimed that they had sustained damage by the diminution in the value of their houses and/or the cost of repairing the defects. Against the council they alleged negligence and breaches of duty in failing to ensure that the plans and the foundations complied with the relevant by-laws; in failing to inspect properly during the work; and in issuing the certificates of December 15, 1965. By their defence the council claimed inter alia, that the action was barred under section 2(1) of the Limitation Act 1939.
>
> On a reference for trial of the preliminary issue whether the action had been brought within six years from the date on which the cause of action had accrued, the judge held that the action was not statute-barred, first, because the last pleaded act of negligence, namely the certificate of December 15, 1965, was within the six year limitation period; and secondly, that in any event no cause of action accrued until the date when there was for the first time a potential plaintiff, and that in the instant case that date was the date of the respective conveyances, November 12, 1965, and January 26, 1966, both of which were within the limitation period.
>
> On appeal by the council, it was held, dismissing the appeal, that, on the assumption which had to be made on the trial of a preliminary issue that the facts were as pleaded, the judge had rightly held that the plaintiffs' action was not time barred, for the latest act of negligence pleaded was the certification on December 15, 1965, so that the action begun on October 22, 1971, was begun within the six year limitation period; and on the judge's second conclusion both the conveyances to the plaintiffs were also within that period.
>
> The court held that the cause of action for negligence accrues, not at the date of the negligent act or omission, but at the date when the damage is first sustained by the plaintiff. Where therefore a council negligently and in breach of their by-laws passes plans or approves insufficient foundations and other work in progress, and the work is then covered up, the cause of

> action for negligence against the local authority accrues only when the damage manifests itself and the person who then has an interest in the house first discovers it or should with reasonable diligence have discovered it and is in a position to sue the council.

[para20] The rule however only gives a foot in the door and ordains that time shall commence to run when the damage manifests itself. The claim still has to be proved. By the same analogy the Municipality under the Building Code Act has a year after it has had a reasonable opportunity to discover a contravention of the Act to institute proceedings. The delict however must still be proved.

[para21] In this case the Municipality first discovered the construction on June 21, 1995, which is the date when the subject matter of the proceedings arose. The one year limitation to commence proceedings began on that date. The offence of constructing without a permit is of a continuing nature. I do not therefore accept Mr. Olmstead's submission that the charges against the defendants must be dismissed because there was no construction proved to have occurred on September 12, 1995, or between June 22, 1995, and September 12, 1995.

[para22] I do not accept Mr. Duncan's submission that the director of the corporate owner is in effect deemed to have knowledge of the contravention. If that were so, there would have been no necessity for the legislation to provide that liability can only attach to a director if he knowingly contravenes the order. The word knowingly is inserted in the section for a reason and knowledge on the part of the director must be proved. While there may be a strong inference of such knowledge if the corporation is the alter ego of the director, that is not the case here. Mr. Di Giuseppe is not the sole director of 593288 Ontario Limited. There is a second director who is also the treasurer of the corporation. In my opinion merely doing nothing after having received the Order to Comply did not fix Mr. Di Giuseppe with the necessary guilty mind. The appeals against findings of guilt with respect to him will be allowed and acquittals entered.

[para23] With regard to the appeals by 593288 Ontario Limited there is a complete absence of the assessment of the evidence of Mr. Vatalaro, the only defence witness. Mr. Vatalaro's evidence is to the effect that he was employed by 593288 Ontario Limited in September, 1994, and there was no construction in the premises from that time. But there was evidence from Messrs. Schuster and Luchetta that the construction was recent. While there is no definition of the term "recent" in this context, the learned Justice of the Peace was entitled to find that the construction occurred sometime between September 1994, and June, 1995, during which time the owner would have been responsible for obtaining a permit. Throughout that time, on Mr. Vatalaro's evidence, 593288 Ontario Limited was the owner of the subject premises.

[para24] The Justice of the Peace did not expressly reject Mr. Vatalaro's evidence. However her failure to do so did not cause her to fall into reversible error because her findings of guilt can be supported by the evidence. R. v. Burns, (1994), 89 C.C.C. (3d) 193.

[para25] In the circumstances, the appeals by 593288 Ontario Limited are dismissed.

Ontario Court of Justice (General Division)
Windsor, Ontario
McMahon J.
August 29, 1996.

Counsel:
Leon Paroian, for the applicants.
Arthur M. Barat, for the respondents.

[para1] McMAHON J.:-- This is an application to this court appealing a decision of the Chief Building Official of the Municipal Corporation of the Town of Tecumseh, dated March 14,
1996 wherein Mr. Lessard the said Chief Building Official revoked Building Permit #6472, dated November 8, 1995.

[para2] The said Building Permit provided for the construction of a sunroom which would attach the house and the garage located on the property of the applicants.

[para3] In order to clearly understand the issues before the court, it is necessary to provide a short history of what has occurred relating to these premises.

History:

[para4] The applicants reside at 12330 Riverside Drive, East in the Town of Tecumseh.

[para5] In the year 1989, the applicants applied to the Municipality for a permit to construct a four car garage on the premises. This garage was to include a second storey which the applicants advised the authorities was to be used for storage. This application was initially opposed by the Town Council. The property was at that time zoned as R1 and it was the view of the council that a garage of this size would impede the view of the Detroit River.

[para6] The application subject to amendments was however approved by the Committee of Adjustment and the garage was completed. It is to be noted, that on this original application in 1989, it was endorsed by Mr. Tino the Building Inspector, that the garage was for residential purposes only as an accessory building, and was not to be used for commercial or rental purposes.

[para7] It is admitted, that after the construction of the garage, the applicants did without obtaining further permits and without the approval of the Municipality conduct certain construction on the second storey of the proposed garage. This construction included the creation of rooms, drywalling, insulation, installation of a vapour barrier, certain plumbing, electrical wiring, installation of a heating system and installation of a sanitary sewer. This as it is admitted was all done without acquiring the proper permits. However, at no time was the second storey ever used for commercial or rental purposes, but was used for storage.

[para8] In June of 1995, the applicant states, that their taxes increased by 50 percent under the new Market Assessment procedure. In order to help offset this increase, the applicants decided to take advantage of Bill 120, which allowed for the creation of apartments in residential buildings, and applied to the Municipality for a permit with that purpose in mind. In essence, the creation of a rental unit.

[para9] The applicants were then advised by the Building Inspector that it could not be granted because of the previously mentioned agreement in the initial construction about non-rental use at the time the garage was constructed.

It was the view of the applicants that Bill 120 had voided any such agreement and gave them the right to create an apartment in the house.

[para10] It was then explained to the applicants, that in order to properly apply for such use it would be necessary to physically connect the garage to the residence. This would then be in compliance with the provisions of Bill 120.

[para11] On October 3, 1995, the applicants submitted an application for a Building Permit which is now under dispute. This Building Permit is numbered 6472, and the application was for the construction of a sunroom to connect the house and the garage, and clearly on the face of that application, was noted so that it applies to Bill C-120. Therefore at the time of this application, the Town was fully cognizant of the intention to convert the garage at a later date to an upper storey rental unit. This was clearly the purpose of constructing the sunroom in question.

[para12] Prior to obtaining approval for the Permit 6472, the garage was fully inspected. At that time, it was discovered by the Municipal Inspectors, both from the Fire and the Building Departments, the work that had already been done on the second storey. In a letter dated November 15, 1995, were a list of items that would have to be completed for the proposed apartment over the attached garage under Bill 120.

[para13] Based on that letter from Mr. Penney of the Building Department, it is noted that the council reviewed the application on the 14th day of November, 1995, and concurred in the application on the 27th day of November 1995.

[para14] It was clearly the intention of the applicants Mr. and Mrs. Bondy and fully understood by the respondents at the time of the issue of the Permit in question for the construction of the sunroom, that upon the completion of that sunroom, a further application would be made for the completion of an apartment above the garage.

[para15] The actual inspection of the existing buildings which was required to take place prior to the issuance of any Building Permit occurred on October 18, 1995. The inspection was done by Randy Cecile, the Town's Fire Chief and Don Penney, a Building Inspector for the Town. Subsequent to that inspection, Mr. Lessard and Mr Tino advised the applicants that they had broken the law by drywalling the second floor of the garage and installing a bathroom without proper permits. The applicants admit, that they neglected to get the permit for the bathroom, but did not know that they were required to have a permit for the drywalling. In the supporting affidavit material, Mrs. Bondy states, that they advised Mr. Lessard and Mr. Tino, that if the bathroom was illegal by the Town Rules, they would remove it from the garage prior to the construction of the sunroom. Mr. Lessard at that point informed them that he would have to take the matter before the Town Council and they would decide whether a permit should be issued, or whether they would be prosecuted for having the illegal bathroom. It was subsequent to that, that the Town Council approved the application and the Permit was issued.

[para16] Because of the weather conditions, constructions was not commenced immediately. In February of 1995, the applicants learned of the pending Bill 20 which would amend Bill 120 and return to the Municipality the sole power of regulating rental units in residences.

[para17] On February 1, 1996, Mrs. Bondy contacted Mr. Tino concerning the pending repeal of Bill 120 by means of Bill 20. She was informed by Mr. Tino that the Municipality was not sure how they were going to handle the matter when 120 was repealed. It was suggested that she await an answer from the Town solicitor before starting construction.

[para18] They again had contact with Municipal authorities concerning this matter. They attended before the Town Council on March 5, 1996 to request that their particular application be grandfathered under Bill 120. In the alternative, requested a 5 week extension of time prior to construction. He advised the council at that time that the Ministry of Housing had issued a Memorandum to Chief Building officials that Bill 120 was law until Bill 20 was proclaimed in force.

[para19] On March 18, 1996, Mr. Lessard forwarded a letter

to the applicants revoking a Building Permit which had been issued for the sunroom. In that letter Mr. Lessard stated as follows:

> "The Permit is revoked by reason of having been issued on false information in respect of the proposed use of the space above the garage as storage space."

[para20] Presumably, this letter of revocation was issued pursuant to s. 8(10) of the Building Code Act which states as follows:

> s. 8(10) - Subject to s. 25, the Chief Building official may revoke a Permit issued under this Act,
>
> (a) if it was issued on mistaken, false, or incorrect information.

[para21] There is no question in the mind of the court that the original Building Permit #4404 for the construction of the garage in 1989 was breached by the actions of the applicants by the work done on the second storey of the garage, particularly the plumbing work and the provision of the bathroom without the proper permit. The applicants could have been prosecuted for that breach and certainly if the work had come to the attention of the authorities, that Building Permit could have been cancelled. That however, is not the issue that is before this court.

[para22] The issue before the court is the revocation of Permit #6472 for the construction of the sunroom to attach the garage to the main building. It is quite clear, that on the very face of that application, the intention to create a rental unit within the meaning of Bill 120 is clearly set out.

[para23] It is quite clear that before the issuance of this permit, the Fire Chief and Building Inspector had attended and were fully aware of the work that had already been done with reference to the second storey. This work was outlined in the letter of the Building Inspector. All of this knowledge was within the control of the Municipality prior to the issuance of the Building Permit in issue.

[para24] It is therefore clear in the view of the court that Building Permit 6472 was not issued based on false information provided by the applicants.

[para25] Accordingly, an order shall issue directing the respondents to reinstate the applicant's Building Permit 6472 for the construction of the sunroom in question.

[para26] The question of the issuance of a future Permit for the completion of the renovation to the second storey is not before this court and this court has no comment to make upon the issuance of such a permit.

[para27] The costs of this application are awarded to the applicants on a party and party basis.

McMAHON J.

Hastings Corp. Ltd. v. Borooah

2004-06-22

Docket:*145/04;03-CV-255048CM1;03-CV-257685CM1*

Date: 2004/06/22
(Divisional Court)
HASTINGS CORPORATION LTD.
Applicant
(Appellant in Appeal)
- and -
ANN BOROOAH, in her capacity as Chief Building Official of the City of Toronto; THE CITY OF TORONTO; and MUC SHELTER CORPORATION
Respondents
(Respondents in Appeal)

MacFARLAND, HOWDEN & LINHARES de SOUSA JJ.
Christopher J. Williams and *J. Mascarin*, for the applicant/appellant
Diana W. Dimmer and *Thomas Wall*, for the Chief Building Official & The City of Toronto
William C. McDowell and *W. Grant Worden*, for MUC Shelter Corporation
HEARD: June 2, 2004

E N D O R S E M E N T

HOWDEN J.

[1] Hastings Corporation Ltd. owns a property on Richmond Street East containing a three-storey commercial building. Across the street and a short distance along Ontario Street, the site of a proposed building is owned by the respondent, MUC Shelter Corporation. In August and October, 2003, the respondent Chief Building Official of the City of Toronto issued two building permits to allow construction on the MUC property of a nine-storey building providing temporary accommodation, transitional housing and support services for refugees and those with refugee-experience. MUC's current lease is nearing its end and it wants to replace its current fifty emergency shelter beds and provide, in addition, fifty-two transitional housing units.

[2] The project is to be funded under the federal Supporting Communities Partnership Initiative ("SCPI") program which is administered by the respondent city, and by a mortgage taken out by Sojourn House, the name of the operating group which relies on funds raised from the community. The transitional housing component is housing for refugees, their families, and refugee-claimants who are homeless and require support to maintain their housing for short or longer periods of time.

[3] This appeal is from a decision by Cameron J. released February 11, 2004. Cameron J. dismissed the appellant's application under the *Building Code Act* to declare invalid and set aside the two building permits issued by the CBO. Those permits resulted from applications filed by the respondent, MUC, on June 6, 2003, following a preliminary project review initiated in April, 2002.

[4] The appellant submits that the application judge erred in the following ways:

· in holding that the proposed use was permitted by the City's zoning by-law and that the CBO had properly classified the proposed use as a "hostel" and "dwelling rooms/units", uses permitted as of right in the RA zone governing the property;
· in holding that the residential amenity space requirement of the by-law was met despite its not being exclusive to the dwelling unit occupants;
· in holding that the Municipal Shelter By-law, passed in February 2003 and not yet fully through the Ontario Municipal Board appeal process, did not prevent issuance of the building permits; and
· in determining that the permits should not be revoked pending the OMB decision.

[5] In addition, the appellant requests leave to appeal from the application judge's determination that the respondents' costs be recovered from the appellant, and for review of the quantum of the costs order.

Zoning Compliance

[6] The zoning classification issue brings into play the standard of review used by Cameron J. in addressing the duty and the decision of the CBO. The CBO had decided that the proposed use in zoning terms came

within those permitted in the AR zone as a "hostel" with "dwelling units", rather than a "crisis care facility". In the zoning by-law, those terms are mutually exclusive. .If the proposed use was properly a crisis care facility, it could not be a hostel and it could not meet the minimum distance separation required from another similar facility. As well, because a crisis care facility by definition provides shelter for persons requiring immediate shelter and assistance for a short period, the proposal would probably not satisfy the additional requirement for a crisis care facility that it occupy the whole of the residential portion of the building. Here, Sojourn House would include several floors of dwelling units for lengthier stays as well as administrative and service offices for support staff, in addition to the shelter beds.

[7] Cameron J. characterized the zoning compliance issue as one of mixed fact and law and found the appropriate standard of review of the Chief Building Official's decision to be reasonableness. In his words:

The issue is more than just a matter of law; it is a mixed issue of fact and law. The court should be reluctant to re-examine such decisions*: Southam* (referring to *Canada* v. *Southam Inc.*, [1997] 1 S.C.R. 748) at para. 35.

The CBO is the designated decision maker under the Code. The CBO regularly classifies proposed uses under the zoning by-law in issuing building permits and so has an expertise in the area.

Accordingly, the decision of the CBO should be accorded some respect. In such circumstances the standard of review is the reasonableness, rather than the correctness, of the CBO's decision: *Runnymede Development Corporation Limited* v. *1201262 Ontario Inc.* (2000), 47 O.R. (3d) 374 at 387 (S.C.J.); *Thomas Furniture Ltd.* v. *Toronto (City) Chief Building Official* (2002), 33 M.P.L.R. (3d) 208 (Div. Ct.), at para. 16. The test is whether the decision is clearly wrong: *Southam*, p. 778, para. 60.

[8] The appellant submitted that Cameron J. erred in using a "reasonableness" standard. The appellant submitted that the CBO's decision should be held to a "correctness" standard in this case because (i) the CBO's principal official responsible for reviewing the proposed project lacked specialized knowledge regarding certain crisis care facilities in the city, (ii) the CBO failed in her duty to make an independent and impartial judgment in issuing the permits before the Ontario Municipal Board's appeal process dealing with the municipal shelter by-law was completed; and (iii) the live issues regarding zoning compliance in this case centred more on issues of law, including the meaning of the zoning definitions, the application to this case of a Divisional Court decision regarding issuance of a building permit for a residence for homeless persons known as Dixon House, and the added twist that the competing use definitions were mutually exclusionary.

[9] Counsel for the respondents stressed the major issues of zoning compliance as heavily fact-driven. They submitted that Cameron J. did not err in adopting a somewhat deferential standard in this case.

[10] There is no doubt that, because of the large range and types of issues which can confront a CBO, the place on the continuum between patently unreasonable and correct varies with the nature of the issue before the court. The closer a CBO's decision is to a determination of law, the closer the standard will be to correctness. *Runnymede Development Corporation, supra*, at p. 215; *Ottawa (City)* v. *Ottawa (City) Chief Building Official* (2003), 2003 Carswell Ont. 5280 (Div. Ct.); *Lock* v. *Middlesex Centre (Township) Chief Building Official* (2001), 22 M.P.L.R. (3d) 66 (Ont. S.C.J.); *Welwood* v. *Huron-Kinloss (Township) Chief Building Official* (2002), 29 M.P.L.R. (3d) 1 (S.C.J.); *Rotstein* v. *Oro-Medonte(Township)* (2002), 34 M.P.L.R. (3d) 266 (S.C.J.).

[11] In our view, the CBO, in determining zoning compliance in this case, faced issues of mixed fact and law, as in most cases of zoning classification. Her officials had to review many documents, consider a variety of professional submissions, examine the site and the area in order to reach factual conclusions about the use and its proposed location. However, when the reviews were completed, the factual component became pretty clear. The CBO was faced at the time of the decision to issue the permits or not with zoning issues relating more to the meaning of the zoning terms and consistency of interpretation of the by-law. As well, the CBO had to deal with "applicable law" in the *Building Code Act* in regard to the effect, if any, of the Municipal Shelter By-law, the appeals from which were not as yet dealt with under the *Planning Act* process.

[12] It is easy to conclude that the middle standard of reasonableness is a suitable compromise for all issues of mixed fact and law, whereas the categorization in this mixed area itself opens up a continuum of review standards dependent on the particular weight of law vs. fact. Iacobucci and Major, JJ. (for the majority) in *Housen* v. *Nikolaisen* (2002), 211 D.L.R. (4th) 577 at paras. 27 and 28:

Once it has been determined that a matter being reviewed involves the application of a legal standard to a set of facts, and is thus a question of mixed fact and law, then the appropriate standard of review must be determined and applied. Given the different standards of review applicable to questions of law and questions of fact, it is often difficult to determine what the applicable standard of review is. In *Southam, supra*, at para. 39, this Court illustrated how an error on a question of mixed fact and law can amount to a pure error of law subject to the correctness standard:

...if a decision-maker says that the correct test requires him or her to consider A, B, C, and D, but in fact the decision-maker considers only A, B, and C, then the outcome is as if he or she had applied a law that required consideration of only A, B, and C. If the correct test requires him or her to consider D as well, then the decision-maker has in effect applied the wrong law, and so has made an error law.

Therefore, what appears to be a question of mixed fact and law, upon further reflection, can actually be an error of pure law.

However, where the error does not amount to an error of law, a higher standard is mandated. Where the trier of fact has considered all the evidence that the law requires him or her to consider and still comes to the wrong conclusion, then this amounts to an error of mixed law and fact and is subject to a more stringent standard of review: *Southam, supra*, at paras. 41 and 45. While easy to state, this distinction can be difficult in practice because matters of mixed law and fact fall along a spectrum of particularity.

[13] With respect, we find that Cameron J. erred in applying the more deferential standard of reasonableness simpliciter to the zoning compliance component. While the CBO was entitled to limited deference in this case, we find that the standard of review required is closer to that of correctness.

[14] In so finding, we place no weight on the appellant counsel's submissions regarding the alleged lack of knowledge of the official in the CBO's office who was cross-examined. The only basis for that submission cited by counsel was that he was not familiar with the details of certain sites zoned as crisis care facilities which appellant's counsel chose to put to the witness during cross-examination; it had nothing to do with his level of knowledge of building and planning issues or his expertise and building code judgment. Likewise, we see no basis for the statement in the appellant's factum, not stressed in oral argument, that the CBO and her officials failed to meet the statutory duty to act independently and impartially. This was clearly not a case like *Peter Kiewet Sons* v. *Tillsonburg (Town)* (2003), 28 M.P.L.R. (3d) 277 (S.C.J.) where the CBO failed completely to consider highly relevant information and was held to have pre-determined that the permit would issue without considering required planning input.

[15] In this case, the CBO took a position initially to await completion of the Municipal Shelter By-law appeals though that by-law was clearly not in effect, nor would it be in effect in the near future as of the date of the permit application. The CBO took into account what was before her, including legal submissions made on the appellant's behalf as to the appellant's position of compliance with all relevant law and with the Municipal Shelter By-law as passed by council. There is no evidence to suggest that the CBO fettered her discretion or failed to exercise her statutory duty to make an independent and impartial determination.

[16] Even using a standard close to correctness, we find that Cameron J.'s acceptance of the CBO's determination of zoning compliance was consistent with the principles and findings in *Thomas Furniture, supra,* a decision of the Divisional Court regarding a similar shelter accommodation for homeless persons called Dixon House. In that case, the Divisional Court faced a submission like that of the appellant in this case, that the proponent's plans properly constituted a crisis care facility and, as that definition excluded "hostel" uses, the proponent failed to comply with the zoning by-law and the building permit should not issue. The Divisional Court as then constituted held, in *Thomas Furniture*:

4. The By-law definition of "crisis care facility" and "hostel" are, in our view, unfortunately drafted in that each definition is qualified by the other. "Hostel" does not include a "crisis care facility"; "hostel" is a defined use in the By-law; "crisis care facility" does not include a use otherwise classified or defined in the By-law. Thus there is an element of circularity in the definitions. It appears that this unfortunate drafting led Jennings J. into error as he appears to have asked himself the wrong question and indeed the problem appears to have arisen by the wrong approach to determining the question. Rather than dealing with both definitions in tandem, with an eye on the companion definition in trying to see which of the two definitions more accurately described the proposed use by DH of the Property, Jennings J. approached the definition of "crisis care facility" in isolation. Then, having concluded that the proposed use fitted the definition of a "crisis care facility", he did not analyze whether the proposed use could be as a "hostel". Jennings J. simply concluded:

11. As the facility is a "crisis care facility" as defined, it cannot be a hostel...

5. Thus he gave no consideration to the exclusionary words in the definition of "crisis care facility" that that use "does not include a use otherwise classified or defined in this by-law."

6. DH in its application for the Building Permit described the proposed use as that of a "hostel". The CBO in granting the Building Permit accepted that proposed use as being appropriate in the circumstances.

14. As indicated in the affidavits advanced by the City as noted above, shelters for abused woman and young children and for run away youth or young prostitutes or detox (alcohol or drug) centres would fit within this definition [of crisis care facility]. However, as we move along the spectrum away from the residence and the assistance requirements of those in acute crisis to the residence needs of the chronic homeless where the shelter aspects may not be linked with any assistance; or the assistance provided may not necessarily be linked to the shelter aspect; and where the dwelling accommodation is not of any limited duration but may in fact be of a long term (months or years) duration as envisaged here in DH's application; then it appears to us that these needs would fall within the "hostel" definition.

17. We would therefore allow the appeal and restore the decision of the CBO which allowed the issuance of the Building Permit to DH to renovate the Property for use as a hostel.

[17] We do not see the fact that the MUC proposal provides housing and support services for a more defined group of homeless people than Dixon Hall, i.e., refugees and refugee-claimants and their families, as a reason to distinguish this case from *Thomas Furniture* in principle. It appears to us that, in asserting (as the plaintiff does in its factum at para. 53) that if the proposed use could be classified as a crisis care facility, then it could not be a hostel, that line of analysis is the very error found by the Divisional Court in *Thomas Furniture*.

[18] In conclusion, we do not see any error in Cameron J.'s acceptance of the CBO's finding on zoning compliance, even when it is reviewed on a standard close to correctness.

Residential Amenity Space

[19] The appellant objected that Cameron J. misinterpreted the by-law's requirement for residential amenity space in the project. This term refers to space in the proposed building on the main, part-second, eighth and ninth floors for such common areas as dining room, kitchen facilities, storage, lounge/TV room, and laundry. It was submitted that the zoning by-law required such amenity areas to be for the exclusive use of residents of the dwelling units, not of the temporary shelter area. As so interpreted, the appellant submits that the proponent's plans do not comply with the applicable law.

[20] Cameron J. held that this argument was without merit because the by-law simply does not limit the residential amenity space only to the non-hostel portion. When this was put to appellant's counsel, he responded that the appellant was interpreting this term in a purposive manner by reading into the by-law a limitation that was not there. We find no basis for the appellant's submission and we find no error in Cameron J.'s disposition on this issue.

The Municipal Shelter By-Law

[21] This by-law was passed by City Council on February 11, 2003. As of June 6, 2003, when the building permit for the MUC project was applied for, it was not in force because of appeals taken to the Ontario Municipal Board, including one by this appellant. But for the appeals, it would have been in full effect as of the permit application-filing date. As passed, the Municipal Shelter By-law permits the proposed refugee hostel/housing project by a site specific exemption from separation distances between similar facilities across the city. The definition of "municipal shelter" in the new by-law includes this project.

[22] The appellant argues that Cameron J. erred in holding that, if parts of the by-law are repealed or amended by the Board such as by removal of the site specific permission granted this project, those amendments or parts repealed are not given retroactive effect to the date of passing of the by-law by the *Planning Act*. Counsel for the appellant submitted that s. 34(30) either clearly has the opposite effect when read in context, or it is ambiguous on its face and the more reasonable interpretation is that the parts repealed or amended by the Board are to have retroactive effect with the rest of the by-law. Otherwise, counsel argues, it would lead to absurd results. Finally, counsel submitted that, if amendments or part-repeals by the Board do not come into effect retroactively, s. 34(30) of the *Planning Act* provides no trigger to put them into legal effect.

[23] Section 34 of the *Planning Act* provides the authority and process for enactment and appeal of municipal zoning by-laws, as well as their effect in law. When a zoning by-law is passed by council, interested parties are given a period within which to appeal to the Ontario Municipal Board (s. 34(19)). If no appeal is filed, the by-law is deemed to come into effect on the day it was passed (unless it accompanied an amendment to the Official Plan, which the by-law in question did not). The Board is given authority to dismiss appeals, or to allow appeals and repeal or amend the by-law, or direct council to repeal or amend the by-law as the Board may order (s. 34(26)).

[24] Section 34(30) reads:

If one or more appeals have been filed under subsection (19), the by-law does not come into force until all of such appeals have been withdrawn or finally disposed of, whereupon the by-law, except those parts of it repealed or amended under subsection (26), shall be deemed to have come into force on the day it was passed.

[25] In this case, the chronology involving the shelter by-law and the building code process is necessary to understand.

· The shelter by-law was passed on February 3, 2003, and was appealed within the proper time to the Board;

· The MUC proposal had passed through the building department preliminary review by June 2002;

· The building permit application was filed on June 6, 2003;

· The permits for foundation and above-grade building issued, with concurrent notice to the appellant, on August 19 and October 6, 2003;

· Cameron J. heard the application on January 21 and 22, 2004 and his decision issued on February 4, 2004.

· The hearing before the Board was bifurcated into two parts: the first part was to deal with the general provisions of the shelter by-law - it continued from the end of September, 2003 for two-and-a-half months and the Board's decision issued March 15, 2004;

· The Board issued an order dated April 29, 2004 purporting to "approve" the by-law as amended by the Board, allow an appeal in part, and, because appeals from the by-law have not all yet been dealt with, ordered that the by-law as amended by the Board does not yet apply to 101 Ontario Street;

[26] We are informed that the second phase of the Board's hearing was adjourned on consent in March of this year until this appeal is finally determined.

[27] Cameron J. noted that the shelter by-law was not in force at the time that the CBO was required to make her decision on the MUC building permits. He held that whatever the Board may decide, there would be no impact in law on the status of the building permits because:

i. either the shelter by-law permission for the MUC project would come into effect unamended and that would have retroactive effect back to its date of passage without adverse effect in law on the hostel/transitional housing proposal for 101 Ontario St.; or

ii. were the Board to amend the by-law by repealing the site specific exemption, such an amendment or repeal would not have retrospective effect and also would not impact in law on the proposed use.

He stated:

I conclude this discussion by declaring that the shelter by-law did not prevent the CBO from issuing the permits.

[28] In our view, Cameron J. did not err in this regard. Read in context and applying to the words used their ordinary meaning, s. 34(30) clearly gives express retroactive effect to the by-law as passed by council to the date of passage by that council. It was that by-law or, if amended later, the unamended unrepealed parts, which went through the public process required under s. 34 of the *Planning Act*, became the expression of council's will on the date of passage, and later became law. Amendments by the Board emanate from the Board's public process and may or may not express the will of council when the by-law was originally passed. We see no reason or useful result in adopting the reading suggested by the appellant by which, on any zoning appeal including appeals from general and area zoning by-laws, all property owners' plans for re-investment or development would be hostage for the length of the appeal process to the uncertainties of amendments which could have retroactive effect back to the start of the process, in this case now some seventeen months from the filing of appeals.

[29] Furthermore, there was no need to include, in subsection 34(30), provision for the coming into effect of amendments by the Board. The power to give effect to all matters exclusively within the Board's jurisdiction under any general or special Act is provided to the Board by its constitutive statute, the *Ontario Municipal Board Act*, in sections 30-37 and clause 109 of its rules, the authority for which is in the same statute.

[30] Under the *Building Code Act*, the CBO is required to issue a building permit unless the proposed building would contravene this *Act*, the building code, or any other applicable law (s. 8(2)(a)). There is no issue arising from the other pre-conditions in s. 8(2). Where an appeal is taken from the decision of the CBO, the judge is required to hold a hearing and is empowered to substitute his or her opinion for that of the CBO in reaching a decision to affirm, rescind or otherwise deal with the decision of the CBO and the permits, including their revocation. To qualify as "applicable law" under s. 8(2), the law must be one which prohibits the proposed construction unless that law is complied with. (O. Reg. 403/97, section 1.1.2.3)

[31] In holding that the shelter by-law was not applicable law for purposes of the *Building Code Act*, we see no error in the judgment of Cameron J. The by-law expressly permits the project, and any amendment which could possibly change the relevant part of the by-law would not affect the CBO's decision in August and October, 2003 when, by s. 8, she was required to make a decision. It is only where the applicable law prevents issuance that the CBO can refuse to issue the permit applied for.

[32] The Municipal Shelter By-law purports to change the existing rules and provide a more uniform approach to shelters/hostels across this recently-amalgamated city. It provides general locational criteria in relation to similar facilities with which the proposed hostel/housing project would not comply. However, the city examined it specifically and concluded that a specific permission for it should be provided. Nothing in the shelter by-law changes the status of the construction applied for as of the time of the permit application.

[33] In conclusion, Cameron J. considered the issue of "applicable law" correctly. We find no error in his conclusion that some future possible change to the Municipal Shelter By-law did not alter the correctness of the CBO's decision to issue the permits pursuant to her duty to do so under s. 8(2) of the *Building Code Act.*

Revocation of Permits Pending OMB's Final Disposition

[34] Cameron J. refused the appellant's request to revoke the building permits and order the CBO not to issue further permits for the MUC hostel/housing project until final disposition by the Ontario Municipal Board of the shelter by-law.

[35] We find that Cameron J. took into account the necessary interests of the parties, his jurisdiction, and all relevant factors. He did not err in law in refusing the appellant's request.

[36] For the reasons given, the appeal is dismissed.

[37] As for the request for leave to appeal from the costs order and the request for review of the quantum of that order, no ground for interfering with Cameron J.'s exercise of his discretion in fixing costs was advanced. Leave to appeal the cost order is refused.

[38] Counsel may make brief written submission in relation to the costs of this appeal, by the respondents by July 9, 2004 and by the appellants in reply, by July 16, 2004.

Kally's Restaurant Inc. v. Scarborough (City)

IN THE MATTER OF the construction of the Islamic Centre of Scarborough by the Islamic Foundation of Toronto and The Canadian Islamic Trust Foundation at Markham Road and Nugget
Avenue in the City of Scarborough
AND IN THE MATTER OF an application for a hearing and appeal
under Section 15 of the Building Code Act, R.S.O. 1980, c. 51

Between
Kally's Restaurant Inc., Applicant, and
The Corporation of the City of Scarborough, George Flemming, The Commissioner of Buildings for the City of Scarborough, Islamic Foundation of Toronto, The Canadian Islamic Trust Foundation, Respondents

Ontario Judgments: [1989] O.J. No. 1994
Action No. M186156/89

Ontario District Court - York Judicial District
Toronto, Ontario

Haley D.C.J.
November 22, 1989

Irving Marks, for the Applicant.
Lou Mangoff, for the City of Scarborough, Respondent.
Leo F. Longo, for Islamic Foundation of Toronto, Respondent.

HALEY D.C.J.:-- This application is brought by Kally's Restaurant Inc. under section 15 of the Building Code Act, R.S.O. 1980, c. 51. The application calls into question the issuing of a building permit to Islamic Foundation of Toronto for the erection of a building comprising a mosque, a day-care centre and a private elementary school. The building is to be erected on a 2.35 acre parcel of land at the southwest corner of Markham Road and Nugget Avenue in the City of Scarborough.

The Applicant is the owner of a 4.11 acre parcel of land at the northwest corner of that intersection. There it carries on a licensed restaurant with banquet facilities.

Because the City of Scarborough's Official Plan and Zoning By-law did not permit construction of the building for the uses proposed by the Islamic Foundation, the City Council adopted amendments to the Official Plan and Zoning By-law in December 1984 to encompass the Foundation's proposed uses. Specifically, the Official Plan was amended to add "Community Facilities" in addition to other uses for the area and a site-specific by-law was passed to provide new permitted uses in the following terms:

13. Community Facilities (CF)

Permitted Uses

- Churches and other uses related thereto

- Day Care Facilities

- Private Schools

The by-law also added a parking standard in the following terms:

113. Minimum of 7.7 parking spaces per 100 square metres or part thereof of gross floor area for churches and other uses related thereto.

This by-law, No. 20954, was passed by the City Council December 11, 1984 and then underwent a series of court applications and hearings before the Ontario Municipal Board. On August 6, 1987 a decision of the Ontario Municipality Board was rendered approving the amendment to the Official Plan and implementing the by-law.

On July 27, 1989 a building permit was issued by the City for the construction of Phase I of the Foundation's project. This phase comprised the building of a two-storey mosque with a prayer hall and rooms and facilities designed for use in

conjunction with it for religious activities and a corridor providing access to and from these facilities and the prayer hall. In the basement under the prayer hall was a cafetorium, a kitchen, washrooms, rooms specifically for religious purposes and a one-bedroom apartment for the caretaker. This building permit was issued on the basis that 148 parking spaces would be required under the by-law for Phase I. There is no evidence before me as to how the wording of the by-law had been applied by the Chief Zoning Plan Examiner for the City, J. Alan Brown, to arrive at 148 parking spaces but presumably there was no difficulty in the application of the by-law because all uses under Phase I were church and church related uses.

On July 28, 1989 a building permit was issued for Phase II of the project for the construction of day-care facilities and a private school and including the Phase I building. No parking standard applies to day-care and school uses under by-law 20954. Mr. Brown examined the plans for Phase II and having made Certain decisions by way of allocating use of the space as between church and church related use functions and day-care and private school functions, made a calculation under the parking standard as follows:

Parking required for Church Uses:

$$\frac{7.7 \times 1508.71}{100} = 116.17\ (117)\ \text{spaces}$$

Plus one space for basement apartment

Total Requirement: 118 spaces.

The drawings submitted by the Foundation in applying for the permit provided for 124 parking spaces. Accordingly Mr. Brown was satisfied that the by-law 20954 parking standard had been complied with and that all other matters also having been complied with, the building permit would issue.

It is the issuing of this building permit which the Applicant seeks to have me set aside under section 15 of the Building Code Act on the basis that Mr. Brown in making his allocation and his calculations wrongly interpreted by-law 20954.

Under section 15(3) I am given the power to rescind or affirm the order or decision of the inspector or chief official or take such action as I consider the inspector or chief official ought to take in accordance with the Act and the regulations, and for such purposes I may substitute my opinion for that of the inspector or chief official.

While Counsel for the Respondent agrees that I have such powers under the Act, he argues that in the circumstances of this case, having regard to the Decision of the Ontario Municipal Board dated August 6, 1987 it would be wrong and perverse for me to make a finding other than that of the Ontario Municipal Board which he says decided that the 124 spaces proposed by the Foundation were sufficient for the combined Phase I and Phase II project of the Foundation. On the other hand, Counsel for the Applicant argues that the approval of the by-law by the Ontario Municipal Board is in the nature of a legislative act and that being so, by analogy to principles for construction of a statute, no reference should be had to any intention or background of the Ontario Municipal Board preceding the making of the legislative act.

While the applicant's argument is a novel and interesting one, in my view of the circumstances of this application, it is not necessary for me to make that determination. I cannot agree with the position of Counsel for the Respondent that a Decision of the Ontario Municipal Board is binding on me acting under section 15 of the Building Code Act nor, in particular, that its hearings are relevant to the issue before me, i.e., did the Chief zoning Plan Examiner correctly interpret the by-law when he determined the number of parking spaces necessary to support the issuing of the building permit.

In making my determination I have considered carefully the Decisions of the Board given July 26, 1985, December 12, 1986 and August 6, 1987. As well there is the Judgment of the Divisional Court following an Appeal from the Board's July 26,

1985 Decision. From the reasons for its decisions it is clear

that the Ontario Municipal Board was not considering the correctness of the Chief Zoning Plan Examiner's interpretation of the parking standard in the by-law as a matter specifically before it. Indeed, the basic issue which the Divisional Court found necessary to direct the Ontario Municipal Board to consider was "the compatibility between the proposed use of the Foundation lands and the extended use of the lands by Kally's for a restaurant licensed to sell liquor".

In making its determination as directed the Ontario Municipal Board, as appears from the various Reasons for Decision, considered several matters including the project's effect on Kally's chances of obtaining further liquor licence permissions and the adequacy of parking facilities with regard to not only parking demands but also to on-site traffic circulation for school buses and parents' cars when picking up and delivering children to the school. In its July 1985 Decision, the Board considered the parking facilities but, in my opinion, made no finding as to the adequacy of 118 spaces. In fact, their discussion of the parking facilities is based on hypothetical statements rather than facts. Examples are:

> "possibly up to 26 spaces may be taken up by teachers and school administration staff"; "the preliminary site plan, filed as exhibit 14, apparently generates a requirement for a total of 118 parking spaces"; "If experience at other similar facilities is any indication of parking demand, perhaps 50 to 70 automobiles additional to school-related automobiles may reasonably be expected, if the current indication of usage is any indication of future usage".

The Board, however, did make a conclusion with regard to the applicability of the parking standards. It said at page 8 of the July 1985 decision:

> "The Board sees no reason why the mosque should be subjected to greater or different parking standards than those generally applicable to churches in the municipality and in this connection calculated on the area of the prayer space and associated areas such as shoe-rooms, washrooms, social areas related to the mosque and caretaker's quarters. Also, having regard for the mixed use nature of the development and the differing hours of operation of each component thereof, these parking standards should be appropriate for the total development."

In its Reasons of December 12, 1986 the Board is clearly concerned with traffic circulation and any suggestion that parking spaces would not be available at all times in order to assist in vehicular circulation. Again the Board supported the parking standard so that it would be consistent with that for other churches in the area but made no determination as to the interpretation of the parking spaces under the by-law.

In its Decision of August 6, 1987 upon which the Respondent particularly relies, the Board heard evidence from Mr. Brown as to his calculation of parking spaces and from a Mr. Middlebro' described as a qualified consultant in transportation planning and engineering. The Board concluded at page 12 as follows:

> "The Board accepts Mr. Middlebro's analysis of the parking requirements for the Foundation's development, including the utilization of temporary spaces. The Board finds that the number of parking spaces calculated by Mr. Brown and substantiated through the evidence of Messrs. Middlebro' and McPhaill, should be adequate to meet the needs of the facility and at the same time, not be so insufficient as to present the possibility of impacting Kally's parking
>
> facilities nor the integrity of Nugget Avenue as a public thoroughfare."

From its discussion of Mr. Middlebro's evidence it is clear that he included in his assessment of adequacy the use of certain spaces mentioned on page 10 of the Decision, namely,

> "another 25 spaces are available in a paved play area separating the grassed school yard from the permanent parking area and 8 tandem parking spaces in the school bus storage lane adjacent to the westerly wall of the proposed building, raising the number of possible spaces to 158".

From page 12 of the Decision it is clear that Mr. Middlebro's

opinion reflected the use of temporary spaces:

> "when Mr. Middlebro' estimated that demand might exceed capacity, he concluded that the 124 permanent parking spaces plus the temporary use of the other portions of the site referred to by Mr. McPhaill, would satisfy his upper-end peak week-day design period (Friday mid-day prayer), demand of about 140 vehicles."

It is clear to me, therefore, that the statement of the Board that the parking facilities were adequate, which I quoted above and which followed the analysis of the parking spaces, was based not on any application of the parking standard under the by-law, i.e., 7.7 parking spaces per 100 square metres of gross floor area but on all available spaces whether available temporarily or at all times. I am satisfied therefore that the parking issue was only one of the matters considered by the Board in making its determination of the issue as directed by the Divisional Court, i.e., as to the compatibility of the proposed use of the Foundation lands with the Kally's lands.

My responsibility under section 15 of the Code is not to assess the adequacy of any parking arrangements but rather to consider whether the Chief Zoning Plan Examiner properly applied the criteria of the by-law in the application of the parking standard set out in the by-law. Accordingly, I do not consider myself bound by the Ontario Municipal Board findings. Nor, if I were to find the plan examiner incorrect in his application of the parking standard do I consider I would be making a perverse finding.

I now turn to an examination of the meaning of the by-law to determine whether the chief official made the correct decision pursuant to the by-law in issuing the building permit and, in particular, whether he applied the performance parking standard correctly on a proper interpretation of the by-law.

For ease in reference, I quote again the permitted uses allowed by by-law 20954 namely:

Permitted Uses

- Churches and other uses related thereto

- Day Care Facilities

- Private Schools

It may be noted at this juncture that only churches have an extended meaning by "other uses related thereto." Day-care facilities and private schools are not so extended in the by-law. Clearly the City acknowledges that church buildings are often used for other than the holding of religious services. There are no problems with the meanings of the uses as they stand alone but only where there is an attempt to combine those uses as we have in this instance.

Attached to the church use only is a performance standard requiring a minimum number of parking spaces. The standard provides:

> Minimum of 7.7 parking spaces per 100 sq. metres or part thereof of gross floor area for churches and other uses related thereto.

The Islamic Centre proposed by the Foundation is a single building covering Phase I and Phase II which contains common areas which might be used for the purposes of one or other or all of the permitted uses under the by-law. For example, on all three floors there is a corridor which gives access not only to the prayer hall and its related activity rooms but also to classrooms and other school related rooms and in the case of the basement to rooms for day-care and kindergarten. As well it is the intention of the Foundation to have the cafetorium on the basement level used by both the members of the religious community and by the school children.

Mr. Brown was candid in his testimony that when he was faced with the problem of determining the gross floor area for the church and other uses related thereto he felt obliged to allocate areas of mixed uses based on a primary use approach. However, in doing this he decided he should treat the cafetorium entirely as a church related use and the corridors, by way of a trade-off, entirely as school use. When pressed in

his cross-examination he also indicated that he considered as well in determining primary use the number of days particular groups used the facility, the number of people using them and the number of times within that day that each group of users would use the facility. In addition he also considered the function of a facility to determine primary use in relation to the permitted uses. For example, the room marked "bookstore" which it would be possible to have used exclusively for religious purposes or exclusively for school purposes he determined would be used primarily by the school with the possibility of some religious books being available for sale.

It is instructive that Mr. Brown in making his allocation had regard to the plans which designated names for various rooms such as home economics classroom, administration office, health room, etc. and to these labels he applied his experience and common sense in assessing the use of the labelled facilities.

On only one or two small matters did he obtain any information from the Applicant themselves. He also says that he looked through a book which his wife had on the Islamic religion.

I find this evidence instructive when it is taken with the evidence of Mr. Posliff who was called by the Applicant as an architect with considerable experience in dealing with projects with religious uses. Using basically the same material on which Mr. Brown relied, Mr. Posliff's assessment of what was meant by church and other related uses was considerably different from Mr. Brown's. For example, Mr. Brown considered that the gymnasium, which included a stage, was a common facility in the public school system in Scarborough for elementary schools. Then judging from its proximity to the school area in the Foundation's building and its separation by the school and the corridor from the mosque section he decided that the gym formed part of the school premises and had nothing to do with the church use. Mr. Posliff on the other hand, from his experience in building churches, thought that churches included gymnasiums to attract youth through sporting activities with the hope that they would become associated with the church. He also thought the provision of meeting space through a gymnasium was part of the church's outreach to the community.

Mr. Nasir, the President of the Islamic Foundation testified that it was not the policy of the Islamic religion to use gym facilities to attract members as other religious organizations might do. I accept Mr. Nasir's evidence on this point. Mr. Posliff's conclusions point up the fallacy of trying to assess the principles and approaches of one religious group by analogy to another. Generally for this reason I put very little weight on Mr. Posliff's testimony as to customary church uses and in particular to the uses of the Pentecostal Church in Agincourt to decide what uses the Islamic Foundation intends for its Centre.

In any case, I am satisfied that there was no basis on a proper interpretation of the by-law for Mr. Brown to apply any use allocation whatever. I note the remark of the Ontario Municipal Board on page 11 of the Decision of August 6, 1987 "it was apparent from Mr. Brown's evidence that he was called upon to exercise considerable discretion under the terms of by-law 20954." I am satisfied that to adopt a method of allocation without any direction in the by-law is to assume a discretion which goes beyond the administrative framework which it is incumbent upon the city to provide in its by-laws for its officials.

I am of the opinion that there is another method for determining gross floor area which can be read from the face of the by-law. The parking standard makes no reference whatever to mixed uses or any reference to any other permitted uses under the by-law. It states clearly that there shall be a minimum of 7.7 for 100 sq. metres or part thereof of gross floor area for churches and other uses related thereto. A plain interpretation of that would allow Mr. Brown to calculate the gross floor area used for the church and all other uses related thereto without reference to the fact that any of these areas are also used under some other permitted use. Particularly is this so where other permitted uses have no parking standards attached to them. The approach therefore is to take gross floor area of the entire building and deduct from it that portion of the building which relates only to the day-care facility and the private school. This avoids the obvious absurdity which has occurred by applying Mr. Brown's allocation method where for Phase I when

there were only church and related uses the number of parking spaces was 148 while for Phase II where there was an addition of uses which did not attract a parking standard, the number of parking spaces was reduced to 118.

In my opinion, my reading of the by-law permits am easy application of the parking standard and the only discretion which must be exercised by the zoning examiner is in determining the gross floor areas of those uses which are not in any way related to "church or other uses". This discretion is well within the limits of any administrative act for the purposes of applying the by-law.

The only issue to be determined on the evidence before me is whether the gym is solely for school use or is combined with church use. I am satisfied on all the evidence that the gym is intended by the Foundation to be used only for school purposes and in support of that I agree with Mr. Brown's observation that it is separate from the religious side of the building and is in close association with the rest of the school rooms.

On my interpretation of the by-law the following areas should be excluded in the calculation of gross floor area for the parking standard.

Basement

Gymnasium
Home Economics Classroom
Day Care with storage area and washroom
Kindergarten with coats and shoes room
Girls' Change Room
Boys' Change Room
Stage

First Floor

Two classrooms
Health room
Teachers' Lounge and Meeting room
Library
Book Store
Guidance room
Administration office

Second Floor

Six Classrooms
Two Workrooms
Science and Art room

I also find that Mr. Brown erred in making the actual parking space calculation. First, the decided that if the calculation of the gross floor area resulted in any portion of area less than 100 square metres that such part required only one additional parking space. I am satisfied that the proper interpretation of this is that every square metre require .077 of a parking space and that for amounts of under 100 square metres the proportionate number of spaces should be determined. For example, if there were 50 square metres, this would attract 3.85 parking spaces and rounding it up to the nearest figure would mean 4 parking spaces.

Because I am not in a position to calculate the gross floor area to apply my interpretation of the by-law, I instruct the Chief Zoning Plan Examiner to rescind the outstanding building permit and make the necessary calculations in accordance with the principles of interpretation I have set out above. If the number of parking spaces required by the new calculation exceeds 124 the new building permit shall not issue on the basis of the proposed parking provisions. Should however the calculation produce parking requirements of 124 spaces or less, a new building permit shall be issued.

Unless the parties wish to speak to me within thirty days of the date of my decision, costs shall follow the event and shall be borne fully by the City of Scarborough and the Islamic Foundation.

HALEY D.C.J.

Lock v. Middlesex Centre (Township) Chief Building Official

Between
Michael Lock and Ian Goudy, applicants, and
Jim McConnell, in his capacity as Chief Building Official for
The Corporation of The Township of Middlesex Centre, The
Corporation of the Township of Middlesex Centre, Rick Howald
and Helga Howald, respondents

[2001] O.J. No. 3588 , Court File No. 30955, **Ontario Superior Court of Justice , Leitch** June 29, 2001.

Counsel:

Paul Vogel and Dawn Kershaw, for the applicants.
David Thompson, for the respondents, Jim McConnell and the Corporation of the Township of Middlesex Centre.
P. Morrissey, for Rick and Helga Howald.

¶ 1 **LEITCH J.**:— The Applicants seek an order rescinding Building Permit No. 0-195 of the Township of Middlesex Centre (the "Township") dated August 21, 2000 relating to the construction of a 1,500 feeder hog barn facility by the respondents, Rick and Helga Howald. Additionally, the applicants seek a declaration that the proposed construction fails to comply with the minimum distance separation formula set by the Ministry of Agriculture, Food and Rural Affairs ("OMAFRA") and contravenes the provisions of the Nutrient Management By-Law 98-051 and Comprehensive Zoning By-law 6550/96 of the Township.

RELEVANT PROVISIONS OF THE BUILDING CODE ACT

¶ 2 This is an appeal pursuant to s. 25(1) of the Building Code Act, S.O. 1992, c. 23, as amended. That section provides a right of appeal of a decision of a chief building official under the Act to any person who considers themselves aggrieved by such decision.

¶ 3 Mr. Jim McConnell, the Chief Building Official for the Township, issued the permit that is the subject of the appeal. Section 8(2) of the Act provides that a chief building official shall issue a permit for construction of a building unless, amongst other things, "the proposed building, construction or demolition will contravene this act or the building code or any other applicable law". In the regulations to the Act, the term "applicable law" is defined as "any general or special Act, and all regulations and by-law enacted thereunder, which prohibit the proposed construction or demolition of the building unless the Act, regulation or by-law is complied with".

BACKGROUND FACTS

¶ 4 The Howald's property is located with an Agricultural (A1) zone. The property owned by Mr. Lock is zoned Agricultural - Residential (AR). According to Mr. Lock's calculations, his property is 650 metres from the site of the proposed barn. According to the Township's calculations his property is 700 metres from the site of the proposed barn.

¶ 5 Section 3 of the Planning Act R.S.O. c. P.13 provides that in exercising any authority that affects planning matters, planning authorities "shall have regard to policy statements issued under the Act". Such a policy statement came into effect on May 22, 1996 and was amended effective February 1, 1997. As noted in its preamble, this statement provides policy direction on matters of provincial interest related to land use planning and development. In terms of agricultural policies, the statement generally provides that prime agricultural areas will be protected and in such areas agricultural uses and normal farm practices will be promoted and protected. As a further matter of policy the statement provides that new land uses and new or expanding livestock facilities will comply with minimum distance formulae.

¶ 6 Mr. Harry Huffman, an Agricultural Engineer with OMAFRA for 29 years, testified that separation is the best solution for incompatible uses and that agricultural engineers believed that an objective mathematical means should be applied uniformly across the province to determine the distance between incompatible uses. Ultimately, OMAFRA created the MDS formulae and according to the OMAFRA's implementation guidelines, these formulae and criteria are to be referenced in municipalities' official plans and included in by-laws and are to be applied in designations and zones where livestock facilities are permitted. As required by the Policy Statement and OMAFRA's implementation guidelines, the Township's Nutrient Management By-law and Comprehensive Zoning By-law incorporate the requirements of the minimum distance formulae.

¶ 7 The preamble to the Township's Nutrient Management By-law indicates that the by-law was enacted "for the purpose of reducing conflicts between normal farm practices in connection with livestock operations and non-agricultural uses on adjacent lands and for the purpose of protecting neighbouring lands from the effects of poor manure management practices". In addition to requiring that applicants for a building permit comply with the requirements of the Building Code Act and all other applicable law, the Nutrient Management By-law provides that a building permit for a livestock barn will not be issued unless the applicant submits a Nutrient Management Plan for the livestock barn and establishes to the satisfaction of the chief building official that the barn will be located in accordance with OMAFRA's Minimum Distance Separation Formulae II ("MDS II"). The Township's Comprehensive Zoning By-law similarly incorporates the MDS II requirements.

¶ 8 According to the background published by OMAFRA, the objective of minimum distance separation is "to prevent land use conflicts and minimize nuisance complaints from odour". This background also contains the following general policy statements:

> A principle of land use planning is the grouping together of compatible land uses and the separating of incompatible land uses.
>
> The agricultural community generally acknowledges that even with the best management, noise and dust cannot be eliminated from certain agricultural operations and that odours are associated with livestock production. Not all rural residents, including some farmers, can accept these conditions, particularly when the nuisance is perceived to exceed acceptable levels.
>
> In rural areas, this principle of separating different and incompatible land uses has not always been applied. Where there has been sufficient separation distance between differing rural uses, however, there have been few complaints. The distance separation will vary with the source of the potential complaint and the sensitivity of the neighbouring land use.
>
> The primary purpose and use of prime agricultural area should be for agriculture. Non-farm residents who seek the advantages of country life must be aware of the noise, odour and dust associated with normal farm practices.

¶ 9 MDS I provides minimum distance separation for new development from existing livestock facilities. MDS II provides minimum distance separation for new or expanding livestock facilities from existing or approved development. MDS II sets out distance factors between the proposed site and various categories of abutting land. A small factor is required for the distance to the nearest road allowance (side or front lot line), nearest side or rear lot line. A factor of one is required for the nearest neighbour's dwelling. The most onerous requirement relates to areas zoned or designated residential, institutional, active recreational or commercial urban areas and a factor of two is required for those areas. The implementation guidelines provide that a completed MDS II data sheet is to be submitted to the OMAFRA agricultural engineer or, in some municipalities, directly to the municipal office for determination of separation distances.

¶ 10 The Howalds have been interested in expanding their hog operation since at least the summer of 1999. At that time, they investigated the building of an addition to their existing barn. They applied for a minor variance to be relieved from complying with the required set back from the

lot line and the MDS II separation distance. In July 1999 the Township's planning department was of the opinion that Mr. Lock's property being a parcel with an Agricultural Residential zone ought to be considered as an area zoned residential within the meaning of MDS II. Subsequently the planning department obtained the opinion of Mr. Johnson, an agricultural engineer with OMAFRA, that the MDS II set back from areas zoned residential was intended only to apply to a cluster of four or more non-farm residential parcels and not intended to apply to a single non-farm residential parcel in an agricultural area. The first minor variance application was deferred at the Howald's request. The proposed addition was reconfigured to alleviate the issue of compliance with the MDS II requirements save and except for the Howald's own property. A second minor variance application was completed in August 1999. The Township's planning department reviewed that application. Mr. Huffman checked the MDS II calculation and provided his comments for and against the application. He proposed two solutions so that the MDS II requirements could be complied with. The Township's planning department did not support the amended application and advised the Howalds they had two viable options (as suggested by Mr. Huffman) - the barn could be located to the north or the northwest or the capacity of the proposed barn could be reduced.

¶ 11 Further to those recommendations, the Howalds made the application that is in issue on this appeal. As required by the Nutrient Management By-Law, they submitted a Nutrient Management Plan that was reviewed by Mr. Harry Huffman on behalf of OMAFRA. He provided the requirement opinion that the plan met OMAFRA's review criteria. Mr. Jim McConnell, as the Chief Building Official for the Township deposed in his affidavit that he considered whether the proposed construction met the requirements of the Building Code Act, The Building Code and any other applicable law as required by clause 8(2)(a) of the Act. He further deposed that, in particular he considered whether the proposed construction contravened the Environmental Protection Act, the Township's Comprehensive Zoning By-law and its Nutrient Management By-law.

¶ 12 With respect to his consideration of the compliance with MDS II, Mr. McConnell set out in his affidavit his calculations of the separation distances required for the proposed new barn compared to actual distances as follows:

Neighbouring land use or boundary	Required Distance	Actual Distance
Nearest Neighbour's Dwelling	475 m	545 m
Areas zoned or designated Residential, Institutional, Active Recreation or Commercial, Urban Areas	950 m	
Nearest Side or Rear Lot Line	95 m	152 m
Nearest Road Allowance (Side or Front Lot Line)	119 m	+/- 380 m

¶ 13 As Mr. McConnell further deposes, the nearest neighbour's dwelling is the McNaughton farmhouse, 545 meters from the proposed barn. The residence of Mr. Lock is to the east of the McNaughton residence and is between 650 and 700 meters from the proposed barn. Mr. McConnell considered whether the Lock residence should, for the purposes of the MDS II calculations, be regarded as being within an area zoned or designated residential. If so, then the required separation distance would be 950 meters, considerably more than the separation distance of between 650 and 700 meters. In para. 29 of his affidavit, Mr. McConnell concluded "That a few scattered non-farm residences within agricultural residential (AR) zoning did not convert this agriculturally designated and zoned area into a residentially zoned area for the purposes of the MDS II calculations" a conclusion which he indicated was consistent with OMAFRA's stated background to the MDS II guidelines and also in accordance with OMAFRA's interpretation of MDS II.

¶ 14 Mr. McConnell concluded that there was compliance with all applicable law and he was therefore obliged by clause 8(2)(a) of the Building Code Act to issue the building permit.

DISPOSITION

¶ 15 As noted previously, an "aggrieved" person may appeal a Chief Building Official's decision to issue a building permit. There was no issue taken with Mr. Lock's or Mr. Goudy's status to appeal Mr. McConnell's decision to issue the building permit. There was no issue that with respect to Mr. Goudy's property, the building permit application complied with the Comprehensive Zoning By-law and the Nutrient Management By-law in every respect. There was also no issue that the MDS II formula had no applicability to Mr. Goudy's property. In Mr. Goudy's affidavit sworn in support of the appeal, he expressed concern with the intensification of livestock operations across the province and questioned the adequacy of the MDS II formula and the Nutrient Management By-law. However, it was acknowledged by Mr. Hugh Handy, an expert in land use planning, nutrient management by-laws and the application of MDS II formula that such issues were not ones that Mr. McConnell could address in his review of building permit applications. Therefore the issue at this hearing was limited to whether the requirements of MDS II were complied with with respect to the Lock property. Specifically, the issue at the hearing was whether Mr. Lock's property located within an agricultural residential (AR) zone is an area zoned or designated residential within the meaning of the MDS II. Accordingly, these reasons deal with the issue relating to Mr. Lock's property.

¶ 16 With respect to the standard of review of the decision of a chief building official, I think it is necessary to refer only to the decision of Malloy J. in Runnymede Development Corp. v. 1201262 Ontario Inc. (2000), 47 O.R. (3d) 374 (S.C.J.) and her conclusion that a standard of correctness will generally be applied to decisions based on law or jurisdiction and a standard of reasonableness will be applied to questions of fact. With respect to questions of mixed fact and law, the more the decision of the chief building official is a determination of law, the closer the standard will be to correctness whereas if the decision is dependent upon factual determinations within the special expertise of the chief building official the more deferential will be the standard. In my view the issue on this appeal relates to Mr. McConnell's conclusion on a question of law and therefore the appropriate standard of review is one of correctness.

¶ 17 The Township's official plan indicates that one of its specific purposes is to emphasize the importance of agriculture in the Township and establish a policy framework which is aimed at protecting and preserving the agricultural resource base for future generations. The plan states that it has been formulated and coordinated to complement, support, and reinforce the continued existence of agricultural activities in the Township. The Official Plan specifically provides authority to the Council to consult with OMAFRA when addressing the flexibility and viability of farm parcels. Mr. Handy acknowledged on cross-examination that agriculture is by far the dominant land use in the Township and that in the Official Plan Council has stated a strong municipal commitment to agriculture. However, in his affidavit Mr. McConnell did not indicate that he made reference to the Official Plan in considering whether the building permit ought to be issued. Indeed, it has been held that official plans do not constitute "other applicable law" within the meaning of s. 8 of the Building Code Act and it is only zoning by-laws which implement official plans which constitute such law (see re: Woodglen and Co. Ltd. v. City of North York et al. 1984, 47 O.R. (2d) 614 (Div. Ct.) and 2847906 Canada Inc. (C.O.B.) Doug Millard Farms v. South-West Oxford (Township), [1998] O.J. No. 2710 (Gen. Div.)) Accordingly, Mr. McConnell was correct in not considering the Official Plan in his review of the building permit application.

¶ 18 As noted the issue on this appeal is whether Mr. McConnell was correct in his interpretation of the term "area zoned or designated residential" within MDS II. MDS II does not contain a definition of that term. Similarly, there is no definition of that term in the Nutrient Management By-law or in the Zoning By-law. MDS I contains a definition of "rural residential cluster" and defines this term as being four or more abutting lots. Mr. Johnson of OMAFRA applied this definition when asked for his opinion with respect to MDS II compliance on the first minor variance application. Mr. Handy considered such an approach erroneous. It

was Mr. Handy's opinion that Mr. Lock's property is an area zoned residential within the meaning of MDS II. He noted that there was nothing in MDS II that suggested that property would not be considered a residential area unless there was more than one lot zoned as residential. As a result, it was Mr. Handy's opinion that the location of the proposed livestock barn did not comply with the MDS II formula and therefore did not comply with the Nutrient Management By-law and the Zoning By-law. The applicants rely on Mr. Handy's opinion and further assert that on a plain reading of the term "residential area" Mr. Lock's property fits within that category of property which should be twice the minimum distance from the proposed barn and Mr. McConnell has made an error in law.

¶ 19 Mr. Huffman's opinion contrasted with Mr. Handy's. Mr. Huffman testified that according to the implementation guidelines to the MDS II OMAFRA reviews calculations to ensure proposed construction meets MDS II requirements but does not determine compliance with municipal by-laws. OMAFRA also reviews applications for minor variance and offers positive and negative comments on such applications particularly in relation to whether the MDS II requirements are met. In fact the Township's Planning Department, while reviewing the minor variance applications made in 1999 changed its interpretation of the requirements of MDS II in relation to Mr. Lock's property after consulting with OMAFRA. Mr. Huffman's opinion is that a distance factor of two is not required for a single family dwelling in an agricultural residential zone. It was his opinion that such a residence ought to be treated in the same manner as the nearest neighbour. He indicated that twice the normal separation distance is only required for areas where the primary use is other than agriculture and that type of priority use rather than agriculture will expand and should be protected.

The province by its policy statement has required municipalities to incorporate a province wide standard into its by-laws. Clearly Mr. McConnell adopted OMAFRA's interpretation of MDS II requirements in determining whether the Howald's application complied with applicable law. While Mr. Handy disagreed with that interpretation he acknowledged there was nothing wrong with Mr. McConnell consulting OMAFRA. Is OMAFRA's interpretation that a single lot zoned for residential use is not an area zoned or designated residential correct? I disagree with the applicant's assertion that such an interpretation is inconsistent with the plain reading of MDS II. Further I find that such an interpretation is consistent with the provincial policy statement and the published background to MDS II by promoting and protecting agricultural use and such an interpretation allows MDS I and II to be read in harmony which Mr. Handy acknowledged was appropriate. Therefore I conclude that Mr. McConnell was not incorrect in his conclusion that on the building permit application complied with MDS II and did not contravene the provisions of the Township's Nutrient Management By-law and Comprehensive Zoning By-law.

¶ 20 For the foregoing reasons this application is dismissed. If necessary counsel may make brief written submissions on costs within 30 days.

LEITCH J.

MARIANI v. TOWNSHIP OF PUSLINCH

DATE: 20040512
DOCKET: C39746

COURT OF APPEAL FOR ONTARIO

CATZMAN, GOUDGE and SHARPE JJ.A.

BETWEEN:

SHARON ANN MARIANI ***Plaintiff (Respondent)***

- and -

JOHN ADRIAN LEMSTRA, ANNE LEMSTRA, ALPINE HOMES LTD., MARINUS VAN ENGEN, THE CORPORATION OF THE TOWNSHIP OF PUSLINCH ***Defendants (Appellants)***

Timothy P. Bates and M. Christine Fotopoulos for the appellants, John Adrian Lemstra and Anne Lemstra
Anna Towlson for the respondent, Sharon Ann Mariani
Peter Haney for the respondents, Alpine Homes Ltd. and Marinus Van Engen

HEARD: April 8, 2004

On appeal from the judgment of Justice Thomas M. Dunn of the Superior Court of Justice dated February 14, 2003.

SHARPE J.A.:

[1] Sharon Ann Mariani purchased a home from the appellants, John and Anne Lemstra, pursuant to a standard agreement of purchase and sale. Some time after the transaction closed, Mariani discovered structural defects in the construction of the home. The issue on this appeal is whether the Lemstras are liable to Mariani for any of the cost of repairing or demolishing and rebuilding the home.

[2] The Lemstras built the home on a piece of vacant land approximately four years before they sold it to Mariani. John Lemstra acted as his own general contractor and did some of the work himself. Anne Lemstra assisted in the design of the home. It was to be the Lemstras' "dream home". However, due to a change in John Lemstra's employment, they had to move. They vacated the property and put it up for sale. The listing agreement described the home as "well-built". Ten months later, Mariani inspected the home with her own real estate agent and again with her father-in-law who had experience in construction. He advised her that the home was well-built and she entered the agreement of purchase and sale. The standard form agreement of purchase and sale contained an "entire agreement clause" at clause 22, which provided:

> There is no representation, warranty, collateral agreement or condition, whether direct or collateral or expressed or implied, which induced any party herein to enter into this Agreement or on which reliance is placed by any such party, or which affects this Agreement or the property or supported hereby, other than as expressed herein.

[3] The transaction closed approximately one month later on May 30, 1991. Some time after the closing, Mariani discovered a number of problems with the house. The most serious were cracking along a high centre bearing wall and excessive dampness in the basement. Mariani commenced this action in 1993. In addition to the Lemstras, Mariani sued the Corporation of the Township of Puslinch ("Township") alleging negligent inspection. She also sued Alpine Homes Ltd. and Marinus Van Engen, who had constructed the centre load-bearing wall. Over the next several years Mariani retained various experts to advise her how to remedy the structural defects of the centre wall and the building envelope. She did not carry out any significant repairs and, after the home became infected with toxic mould, she concluded that it was necessary to demolish the house and rebuild. By the date of trial, she had commenced the construction of a new home on the same property, but she had not demolished the house that is the subject of this litigation.

[4] Prior to the trial, Mariani entered into a "Mary Carter"-type settlement agreement with the Township. The Township paid Mariani $150,000. Mariani agreed that if all crossclaims against the Township were not dismissed on consent, Mariani would not enforce any judgment against the other defendants for more than their apportioned share of liability, which would avoid any claim for contribution against the Township. The Township also reached a settlement with Van Engen and Alpine Homes, whereby the latter agreed to dismissal of their crossclaim against the Township. The Lemstras and the

Township reached a partial settlement. The Township abandoned its crossclaim against the Lemstras, but the Lemstras were at liberty to advance their crossclaim against the Township. The Township agreed not to defend the crossclaim and the Lemstras undertook not to pursue any award of costs that might be made in their favour against the Township.

[5] In the action, Mariani alleged a long list of defects in the home. The two most significant were that the centre load-bearing wall was structurally unsound and that the building envelope was defective, resulting in water penetration. The trial judge found that these two defects were proved, but rejected all of Mariani's other complaints and claims, including her claims for damage to personal property, mental distress and the loss of rental of a basement apartment.

[6] The trial judge found liability on the part of both the Lemstras and the Township apportioned at seventy-five per cent and twenty-five per cent, respectively. The trial judge dismissed the claim against Alpine Homes and Van Engen.

[7] The trial judge found that the Lemstras were liable to Mariani for the cost of demolition and reconstruction. He assessed damages in the amount of $299,610. The primary basis for liability was the trial judge's finding that the Lemstras had "fraudulently (or negligently) misrepresented" the house as being "well-built". The trial judge also found that the Lemstras were liable on the ground that they knew or should have known of defects in the house and failed to disclose them, and that they were liable for the negligent construction of the home and the economic loss suffered by Mariani. The trial judge rejected the Lemstras' submission that Mariani had failed to mitigate her damages by acting more quickly to remedy the defects in the house. The trial judge found that the Township was liable for its negligence in failing to supervise or inspect the building and apportioned its liability at twenty-five per cent. Finally, the trial judge ordered prejudgment interest on the damages awarded from November 19, 1993, the date the statement of claim was issued.

[8] The Lemstras appeal the trial judge's findings of liability and, in the alternative, his assessment of the damages and his awards of prejudgment interest and costs. Although the Notice of Appeal is silent on the point, in their factum, the Lemstras ask this court to find liability on the part of Van Engen and increase the apportionment of liability as against the Township.

ANALYSIS

[9] The transaction between Mariani and the Lemstras was governed by a standard form agreement of purchase and sale. The agreement provided no warranties or guarantees as to the fitness of the property or construction of the house. Mariani had the opportunity to inspect the house and satisfy herself as to its fitness. She is bound by the venerable but enduring principle of caveat emptor - buyer beware. As a result, she does not seek remedy in contract. Mariani can only succeed if she can demonstrate fraud or the breach of some non-contractual duty owed to her by the Lemstras.

1. Fraudulent Misrepresentation

[10] In the listing agreement between the Lemstras and their real estate agent, the house is described as "well-built". The trial judge found that although the statement that the house was well-built was not part of the agreement of purchase and sale, "the plaintiff was aware of it and relied upon it to her detriment". The trial judge further found that as John Lemstra acted as his own contractor and did much of the work himself, "he either knew or must be taken to have known of the defects." The trial judge also found that, "[t]he statement made in the listing agreement that the house was 'well-built' and which the plaintiff says came to her attention prior to making the offer, I find to be a fraudulent (or negligent) misrepresentation".

[11] The Lemstras submit that the trial judge erred both in fact and in law with respect to this finding. I agree with that submission.

[12] It is common ground before this court that the elements of fraudulent misrepresentation are: (1) that the defendant made a false representation of fact; (2) that the defendant knew the statement was false or was reckless as to its truth; (3) that the defendant made the representation with the intention that it would be acted upon by the plaintiff; (4) that the plaintiff relied upon the statement; and (5) that the plaintiff suffered damage as a result.

[13] While it certainly could be inferred that the Lemstras represented to their own real estate agent that their home was well-built, in my view, there is no evidence in the record capable of supporting a finding of fraudulent misrepresentation in Marani's favour on elements (2), (4) or (5).

[14] With respect to element (2) and the knowledge or recklessness of the Lemstras, I cannot agree that because of his involvement in building the home, John Lemstra must be taken to know of the serious defects in construction. We were pointed to no evidence that would indicate that Lemstra had any knowledge that the house was defective. There is no legal

principle to support the finding that as the builder he is in law deemed or presumed to know of defects in the structure. In addition, this finding appears to be contradicted by the trial judge's other finding that the Lemstras "observed no significant problems with the construction or with the finished home" and that the structural problems only became known after the closing of the transaction. Finally, with respect to Anne Lemstra, there is no finding of knowledge or recklessness on her part to support liability against her in fraud.

[15] I have also concluded that there is no evidence in the record capable of supporting the trial judge's finding that Mariani relied to her detriment on any representation from the Lemstras that the home was "well-built". Mariani was asked to identify the documents she saw prior to entering the agreement of purchase and sale. Mariani specifically testified that she did not see the listing agreement and another document derived from the listing agreement that included the crucial words "well-built" home. None of the documents she saw before signing the agreement included the representation that the home was "well-built". While at one point Mariani testified that, prior to entering the contract, she believed the home to be a "custom home, energy efficient, well-built", there is nothing in the trial record that links that impression to anything said or done by the Lemstras. I would add here that the words "custom home, energy efficient, well-built" do not appear in the listing agreement. Finally, before deciding to make an offer, Mariani inspected the home twice, once with her own agent and once with her father-in-law who was involved in the construction industry and advised her that it "appeared to be a well-built home."

[16] Another significant problem with the trial judge's finding is that Mariani did not plead fraudulent misrepresentation. His finding that such a pleading is contained in paragraphs 16-21 of the statement of claim is plainly wrong in law. In these paragraphs, Mariani pleads that the Lemstras knew or ought to have known of the deficiencies and latent defects in the house, and that they had a duty to inform the plaintiff of such problems. This pleading is simply not capable of supporting an allegation of fraudulent misrepresentation, as the essential elements of the tort are not alleged.

[17] Accordingly, I would set aside the finding of liability for fraudulent misrepresentation.

2. Negligent Misstatement

[18] The trial judge appears to have also found liability for negligent misstatement although he did not consider the case in terms of the requisite elements of that tort.

[19] The elements of negligent misstatement set out in Hedley Byrne & Co. v. Heller & Partners Ltd., [1964] A.C. 465 are: (1) a duty of care based upon a special relationship between the plaintiff and the defendant; (2) a false statement by the defendant; (3) negligence on the part of the defendant as to the truth of the statement; (4) reasonable reliance by the plaintiff in the truth of the statement; and (5) the plaintiff suffering damages as a result.

[20] There is no finding with respect to the issue of duty of care. The relationship between the Lemstras and Mariani was governed by a standard agreement of purchase and sale for real estate that explicitly excluded reliance upon any representations. Consequently, it is difficult to see why a separate Hedley Byrne duty of care in tort would not be excluded as well. In any event, as I have already found, there is no evidence capable of supporting a finding of reliance by Mariani on any statement by the Lemstras that the house was "well-built" and that is sufficient to dispose of the tort of negligent misstatement.

[21] Accordingly, I would set aside the finding of liability for negligent misstatement.

3. Failure to disclose defects

[22] The trial judge also found that the Lemstras were liable for failure to disclose the defects in the construction of the house. The trial made the following finding:

> [S]ince John Lemstra himself acted as his own contractor and did much of the work on the construction of the premises, he either knew or must be taken to have known of the defects. The Lemstras' failure to advise the purchaser Mrs. Mariani of these defects, in my opinion, is actionable and sufficient to allow Mrs. Mariani recovery.

[23] A vendor may be required to disclose known latent defects: see P.M. Perell & B.H. Engell, Remedies and the sale of land, 2d ed. (Toronto: Butterworths, 1998) at 102. However, as I have already stated, the trial judge erred by imputing such knowledge to the Lemstras. I have already dealt with

negligent misstatement. Another possible head of liability would be innocent misrepresentation inducing the contract. However, if made out, that claim would support rescission of the contract, not liability for damages in tort for the cost of demolition and construction: see S.M. Waddams, The Law of Damages, looseleaf (Toronto: Canada Law Book) at 5.640-5.650. No claim for rescission has been advanced. Accordingly, if the trial judge intended to impose liability for some form of misrepresentation other than negligent or fraudulent misstatement, it is my view that he erred in law.

4. Negligent Construction

[24] While his reasons are not as clear as they might be, the trial judge also appears to have found that the Lemstras were liable for the economic loss flowing from the negligent construction of the home. He mentioned the leading case Winnipeg Condominium Corporation No. 36 v. Bird Construction Co., [1995] 1 S.C.R. 85, and he found that there were two latent defects that rendered the house dangerous. The first defect was the centre structural wall and the second defect was the problem with the building envelope and resulting moisture and eventual mould that made the house uninhabitable.

[25] Winnipeg Condominium establishes that a builder owes a duty of care to subsequent purchasers. As La Forest J. stated at para. 35:

> [I]t is reasonably foreseeable to contractors that, if they design or construct a building negligently and if that building contains latent defects as a result of that negligence, subsequent purchasers of the building may suffer personal injury or damage to other property when those defects manifest themselves. A lack of contractual privity between the contractor and the inhabitants at the time the defect becomes manifest does not make the potential for injury any less foreseeable. Buildings are permanent structures that are commonly inhabited by many different persons over their useful life. By constructing the building negligently, contractors (or any other person responsible for the design and construction of a building) create a foreseeable danger that will threaten not only the original owner, but every inhabitant during the useful life of the building [emphasis added].

[26] However, a claim for defective construction is a claim for purely economic loss, and recovery under the Winnipeg Condominium is subject to an important caveat. The structure must be dangerous, not merely shoddy, and it is only the cost of repairing the structure and restoring it to a non-dangerous state that is recoverable: see Winnipeg Condominium at para. 12.

> [T]he degree of danger to persons and other property created by the negligent construction of a building is a cornerstone of the policy analysis that must take place in determining whether the cost of repair of the building is recoverable in tort. As I will attempt to show, a distinction can be drawn on a policy level between "dangerous" defects in buildings and merely "shoddy" construction in buildings and that, at least with respect to dangerous defects, compelling policy reasons exist for the imposition upon contractors of tortious liability for the cost of repair of these defects.

[27] The Lemstras submit that the trial judge erred in three ways. First, they submit that the Lemstras owed no duty of care to Mariani sufficient to sustain liability for negligent construction. The Lemstras were not commercial builders. Unlike the commercial builder in Winnipeg Condominium, they were not building the house with the intention to sell it. The Lemstras built the home as their "dream home" with the intention to live it in indefinitely. It was only when their economic situation took a turn for the worst that they decided to sell.

[28] I do not agree with this submission. Anyone who builds a home for their own use must be taken to know that that their circumstances may change and that, someday, they may have to sell it. As the passage I have quoted above indicates, the duty is imposed not only upon building contractors, but also upon "any other person responsible for the design and construction of a building". See also Perell, supra at 143: "…[A] vendor who is also a builder assumes the same responsibilities as a third party builder."

[29] The Lemstras' second ground relates to the question of dangerousness. They submit that while the centre wall was unstable, the house was not dangerous in the sense that there was any risk to personal safety or of

imminent collapse. The trial judge found that the defective centre wall "rendered the premises dangerous" but then added:

> The various experts apparently did not conclude that it was unsafe in the sense that the house was likely to collapse but it is clear from that same evidence that the centre wall deficiencies made the house susceptible to movement or shifting in any significant wind, or as the case may be, snow load.

[30] The trial judge also found that "the proliferation of mould … presents a danger to the occupants of the house." The Lemstras argue that the toxic mould only developed after Mariani failed to take meaningful remedial steps to prevent the penetration of water into the house despite the advice of her own experts. The Lemstras say that even if the building envelope was defective, the defects could have been remedied at a much lower cost if the problems had been tackled in a timely fashion. The trial judge rejected the contention "that the proliferation of mould was simply a lack of maintenance by the plaintiff or indeed one that even now can be remedied". When it came to considering whether Mariani had acted reasonably to mitigate her damages, he found that, "[c]ertainly in the best of all worlds, in 1993 she could have spent substantial money to correct the problem but I cannot say that by acting as she did that she failed to mitigate the damages as a reasonable person might".

[31] I would not interfere with the trial judge's findings with respect to dangerousness. There was expert evidence that the centre wall was unstable and dangerous within the meaning of the Ontario Building Code, R.R.O. 1990. While those same experts agreed that there was no danger of imminent collapse, there was evidence that the defect made the building unstable and that, if not repaired, it might collapse under a heavy snow load and that if not repaired, "a catastrophic condition may prevail". Similarly, with regard to the problem with the building envelope, it is evident from what has actually happened that if not remedied, the entry of water into the structure can lead to a condition hazardous to health and to property in the home.

[32] In my view, the evidence on both defects is capable of bringing the case within the Winnipeg Condominium principle. That case does not require the level of immediate danger suggested by the argument advanced by the Lemstras. The operative principle is explicitly preventative. Recovery for the economic loss of repair is allowed to avoid the greater cost of recovery for personal injury should the danger materialize and this must mean that the plaintiff is entitled to claim for the cost of repairs required to avoid the danger and to prevent it from occurring. La Forest J. stated at paras. 36-37:

> If a contractor can be held liable in tort where he or she constructs a building negligently and, as a result of that negligence, the building causes damage to persons or property, it follows that the contractor should also be held liable in cases where the dangerous defect is discovered and the owner of the building wishes to mitigate the danger by fixing the defect and putting the building back into a non-dangerous state. …
>
> Apart from the logical force of holding contractors liable for the cost of repair of dangerous defects, there is also a strong underlying policy justification for imposing liability in these cases. …[T]he plaintiff who moves quickly and responsibly to fix a defect before it causes injury to persons or damage to property must do so at his or her own expense. By contrast, the plaintiff who, either intentionally or through neglect, allows a defect to develop into an accident may benefit at law from the costly and potentially tragic consequences. In my view, this legal doctrine is difficult to justify because it serves to encourage, rather than discourage, reckless and hazardous behaviour. Maintaining a bar against recoverability for the cost of repair of dangerous defects provides no incentive for plaintiffs to mitigate potential losses and tends to encourage economically inefficient behaviour.

[33] However, I do agree with the Lemstras' third ground, namely, that the quantum of damages awarded by the trial judge cannot be sustained as damages for negligent construction. The trial judge found that by the time of trial, the building had no value and that Mariani was entitled to the lesser of the cost of replacement ($300,000) and the difference between the price she paid for the property ($375,000) and the value of the land at the time ($100,000), namely $275,000, plus the cost of demolition ($23,000) for a total of $298,000. Under Winnipeg Condominium, at para. 42, Mariani is entitled only "to the reasonable cost of putting the building into a non-dangerous

state". As I have rejected the other grounds for liability, it follows that the damages must be assessed based on liability for negligent construction, and reduced accordingly.

[34] It is admittedly difficult to measure those damages on the basis of the findings of the trial judge, but in view of the extremely protracted course this litigation has followed, it is in the interest of all parties for this court to do the best it can in order to bring this matter to completion.

[35] The Lemstras say that at best, Mariani should be limited to the cost of the recommended repairs to deal with the two defects. In 1993-4, Mariani received estimates for $13,624 to deal with the problems with the building envelope and $6,000 to deal with the centre wall problem. However, Mariani considered this to be a "band-aid" solution, and the trial judge found that she acted reasonably in getting further estimates. The trial judge's factual findings are entitled to deference in this court, and I would not interfere. In 1998, there were two repair estimates, one for $100,657 and the other for $131,125. In my view, it is appropriate to award Mariani damages in the amount of $100,657 for negligent construction on the basis that the structure could have been restored to a non-dangerous condition for that amount.

[36] Mariani is entitled to prejudgment interest on that award at the rate prescribed by the Courts of Justice Act, R.S.O. 1990, c. C.43, but having insisted on postponing the repairs, she should not be awarded prejudgment interest from the date of the statement of claim, but only from the date the cost would have been incurred. I would take that to be the date of the estimate upon which the award is based, namely October 29, 1998.

[37] In my view, there is sufficient evidence of Anne Lemstra's involvement in the design and construction of the house to render her liable for negligent construction and, accordingly, for these damages.

5. Liability of Alpine Homes and Van Engen

[38] I see no basis to interfere with the trial judge's finding that Alpine Homes and Van Engen are not liable for any portion of the damages awarded to Mariani and I would dismiss the appeal against them.

CONCLUSION

[39] Accordingly, I would allow the appeal in part and vary the judgment at trial by

1. Substituting in paragraph 1 damages assessed at $100,657.

2. Amending paragraph 2 to reflect the reduction in the damages payable by the Lemstras to $75,493 in view of the apportionment of liability with the Township.

3. Amending paragraph 3 to provide for prejudgment interest at the rate prescribed by the Courts of Justice Act from October 29, 1998.

[40] In their submissions, the parties did not address the effect or impact of the settlement reached between Mariani and the Township upon Mariani's entitlement to enforce the judgment against the Lemstras. Accordingly, these reasons do not touch upon that issue.

[41] I would not interfere with the trial judge's costs assessment of quantum of the trial costs. However, the appellant shall have ten days from the release of these reasons to make written submissions as to the effect, if any, of this judgment upon the trial costs, and the respondent shall make any reply within ten days thereafter.

[42] The appellants have achieved substantial success on appeal and I would fix their costs of this appeal at $30,000 inclusive of GST and disbursements. Alpine Homes and Van Engen are entitled to their costs of the appeal against the appellants fixed at $3,500 inclusive of GST and disbursements.

7. Notes and documents showing demolition has taken place	Already provided			No order: accepts City's position that it has nothing else to provide
8. City's policies, by-laws and regulations that the by-law officer was authorized to enforce	Not relevant: matter for argument			Ordered disclosure
9. Documents and evidence to establish use of the property	Not relevant: matter for argument			No order: not relevant
10. Building permits for each property	Municipal *Freedom of Information Act* requires respondents to provide consents from previous owners			No order: not relevant
11. Documents showing building unsafe at relevant time, which portions are unsafe and why	Already specified in unsafe order: remainder of request not relevant		Has no other material to	No order: accepts City's position

			disclose	
12. City's maintenance and occupancy by-law	Irrelevant because respondents not charged under this provision			Ordered disclosure
13. Building and demolition permits that would authorize an inspection under s. 12 of the *Building Code Act*	Matter for argument		Ryan did not apply for permits	No order: accepts City's position
14. Evidence of construction taking place	Disclosure given			No order: accepts City's position
15. Evidence that respondents failed to comply with unsafe orders between June 21, 2002, and July 15, 2002	City has given disclosure and particulars of the unsafe order in count 6			No order: accepts City's position
Evidence of when on July 5, 2002, the various orders were obstructed	Evidence of obstruction already provided			No order: accepts City's position
17. Evidence of relevant duties to be carried out by city inspectors and when they were prevented from carrying out their duties	Disclosure already given, and particulars given in Carroll's letter			No order: accepts City's position
18. Particulars of all site visits	Affidavit notes of relevant site visits already produced: affidavit gives additional disclosure of index and notes of site visits between June 18, 2001, and August 16, 2002			Order for additional disclosure for site visit on July 16, 2001

Peacock v. CBO of Norfolk County

COURT FILE NO.: 0002/02

DATE: 2003/07/03

ONTARIO

SUPERIOR COURT OF JUSTICE

B E T W E E N:

MARILYN PEACOCK and REGINALD PEACOCK

Appellants

and -

WAYNE CAMPBELL, CHIEF BUILDING OFFICIAL OF THE CORPORATION OF NORFOLK COUNTY

Respondent

Thomas A. Cline, Q.C., for the Appellants

Keith M. Jones, for the Respondent

THE HONOURABLE MR. JUSTICE D.J. TALIANO

[1] This is an appeal by Marilyn and Reginald Peacock ("the appellants") from the decision of Wayne Campbell, Chief Building Official for the Corporation of Norfolk County (the "County") denying a building permit for construction of an addition to the appellants' hog barn on their 50-acre parcel of land located on part of lot 5, concession 13. The decision to refuse the building permit was based on the passage of an interim control by-law (the "By-law") that froze intensive hog developments for a period of one year in the County, pending a study of their environmental impact. The development freeze and the environmental study, form the backdrop for this clash between individual rights and the public health concerns triggered by the lessons of Walkerton.

[2] The appellants take the position that:

(a) their rights to a building permit crystallized before passage of the By-law and alternatively, that the county manager interfered in the performance by the Chief Building Official of his legislative duties and this constitutes an extraordinary circumstance that requires the intervention of this court;

(b) the By-law only regulates the use of land and/or structures, but does not preclude the erection of a structure on the land;

(c) the 50-acre parcel had the status of a prior non-conforming use for the purpose of an intensive hog operation and was therefore exempt from the By-law;

[3] Counsel on behalf of the Building Official takes the position that:

(a) the building permit was properly refused because of the prohibiting By-law which had been passed by the time the Building Official considered the application;

(b) the application was dealt with expeditiously and within normal time parameters free from any bad faith or unreasonable delay;

(c) although the appellants may have satisfied the requirements of a prior non-conforming use, that does not entitle them to expand their use, particularly when the use and/or its expansion may endanger the community;

(d) the Corporation of the Town of Norfolk, although not a party to these proceedings, moves for a stay of proceedings or in the alternative for a stay of the issuance of a building permit, on the grounds that an extension or addition to the existing operation, may irreparably harm the source of water supply for the Town of Simcoe. Counsel for the Town relies on section 106 of the *Courts of Justice Act*, which empowers the court to grant a motion by any person, whether or not a party, to stay any proceedings on such terms as are considered just.

BACKGROUND

[4] The appellants and their three sons farm approximately 1200 acres in the County, including a 50-acre parcel which they selected for an intensive hog operation. Their business plan was to build a barn in two phases to house 2,000 hogs. The first phase would see the construction of a barn to house 1000 hogs and the second phase, which was to be an addition to the first building, would house the remaining 1000 hogs. The reason for phasing was that the appellants could then satisfy the minimum distance separation formula. Without phasing, they could not meet the formula. However, following the Walkerton tragedy, intensive farming operations became the epi-centre of fear and controversy and in October 2000, elected officials in the County, by a close vote, debated and then defeated a resolution calling for the passage of an interim control by-law freezing intensive hog operations in the region. Shortly thereafter, (November 7th to be exact) the appellants presented an application for a building permit for their first phase of production. A building permit was issued on November 29, 2000.

[5] Armed with the building permit, the appellants entered into contracts with commercial interests. They arranged financing predicated on a 2000 hog operation and started construction of a driveway. They installed hydro and gas lines. They started work on a well capable of delivering 20 gallons of water per minute, a volume which is necessary to the operation of a 2000 head hog farm.

[6] The appellants' activities generated public alarm because the development was located less than 1,000 metres up-stream from municipal water wells used to supply water to the Town of Simcoe. In addition, the waste that would be produced by the appellants' hogs was to be spread in the form of manure on other lands owned by the appellants. All of the target lands were located within the Davis Creek sub-water shed which connects to other municipal wells. Accordingly, the location of the proposed barn site, the manure spreading sites and their proximity to the municipal water supply raised justifiable fears in the community. The public furor prompted the General Manager for the Planning and Economic Development Services of the County to memo the Chief Building Official requesting him to "detain any building permit applications for hog operations until further notice".

[7] Section 38(1) of *The Planning Act of Ontario* permits a municipality to pass a By-law to be in effect for a period of one year, which may be extended for a further one year, to prohibit the use of land, buildings or structures, within the Municipality, for purposes as set out in the By-law. As a pre-requisite to passing this interim control by-law, the Municipality must, by by-law or resolution, have directed a review or study to be undertaken in respect of land use planning policies within the Municipality. No notice is required although the Town did give such notice in this case.

[8] On December 4, 2001, in response to the public outcry, the Council passed Resolution 15 authorizing staff to proceed with a Norfolk groundwater study in accordance with Provincial funding arrangements, as a precursor to the subsequent passage of the Interim Control By-law.

[9] Notwithstanding the controversy that surrounded their proposed development and notwithstanding the Walkerton tragedy and the identification of agricultural waste as the source of contamination of Walkerton's water, the appellants not only proceeded with the construction of the first phase, but also submitted their plans for the second phase add-on building, on December 17, 2001, apparently indifferent to the risks that their plans might pose to their neighbours.

[10] It is not disputed, that the appellants' application complied with all of the County's regulations on the date that the application was filed. Nor is it disputed that the County accepted the application and placed it in the normal rotation behind other applications previously received.

[11] However, pursuant to the earlier resolution authorizing the ground water study, on December 19, 2001, the County passed the By-law temporarily prohibiting the use of land, buildings or structures within the County for intensive hog operations. This prohibition was subsequently extended to December 18, 2003.

The purpose of the study was to obtain the information necessary to implement land use planning policies for the protection of the Town's water supply. The study specifically authorized an assessment of the impact on water tables of the Peacock application.

[12] After inviting proposals, on May 14, 2002, Waterloo Hydro Geologic Inc. was awarded the contract for this assessment. It was expected to have a draft report available in March 2003 and a final report by May 1, 2003.

[13] The passage of the motion directing a study of the issue and the Interim Control By-law which froze intensive hog operations for a period of one year, prompted the deputy Chief Building Official to deny the permit on December 28, 2001. The appellants were so informed on January 2, 2002.

[14] The appellants continued working on the first phase of their operation which became operational in March, 2002.

[15] It is not disputed that the turn-around period for dealing with applications such as the appellants' was 11 working days. The appellants' application was dealt with in 8 working days.

[16] The appellants subsequently submitted a fresh application on March 21, 2001, this time for a stand-alone barn with capacity to house 1,000 hogs for their 50-acre parcel. This application was also rejected by reason of the By-law. The merits of the application were not assessed for compliance with other applicable requirements.

[17] The appellants concede that they did not undertake any surface or groundwater study to determine if their operation would have an adverse affect on the environment. Equally troubling is the fact that the appellants chose the site for their hog operation based solely on economic considerations. Their proposed development raises serious concerns the specifics of which are detailed in affidavits filed on behalf of the County by Stan Miazga, General Manager for the Planning and Economic Developments Services of the County of Norfolk.

[18] Mr. Miazga states that the County is concerned with the potential leakage from the manure pits but that technology exists for the provision of early warning systems which can detect the leakage of manure from manure pits. The appellants however did not incorporate such a system in their plans. In addition, the use of a non-permeable membrane such as that used by some hog producers, is not proposed in the appellants' operation. Nor does the appellants' proposal include any protection for a catastrophic spill. Finally, the Nutrient Management Plan which was filed by the appellants and approved by the Provincial Agency in charge of such matters, may not have taken into account the proximity of the Town wells since there is traditionally little consultation between the Town and the agency regarding Nutrient Management Plans.

[19] Mr. Miazga goes on to state that the Ministry of the Environment requires Municipalities to undertake engineering reports for the protection of ground-water resources that serve municipal water supplies. Such a report was commissioned by the Town and was performed by MacViron Engineering and Environmental Science. It is dated June 20, 2002. The report identifies the wells serving the Town of Simcoe as the "North-West Well Field" and confirms that they are under the direct influence of surface water. Article 3.10.2 of that report deals with the potential risk to municipal wells of the Peacock operation and states:

...the farm is adjacent to a tributary of Patterson Creek, which flows through the well field. Contaminants generated at the hog farm, if migrating to the creek, could readily be transported to the well field and into the municipal supply.

[20] Figure 21 of the Report shows the two year capture zone affecting the North-West Well field, which includes the Peacock property, barn site and fields for the spreading of manure pursuant to the Nutrient Management Plan.

[21] In an affidavit dated April 24, 2003, Mr. Miazga, indicated that part 3 of the draft report of the Groundwater Study deals with an analysis of susceptibility of a water aquifer to contamination and defines "susceptibility" as the "tendency or likelihood for contaminants to reach a specific position in the groundwater system after introduction as some location above the uppermost aquifer". A susceptibility index defines the risk as being "low, medium, or high" based on the depth and type of soil above the water table. The report points out that once the groundwater is contaminated, it is impractical to consider groundwater remediation as a solution. The key, is prevention. The area where the municipal wells is located, is in the Norfolk Sand Plain, which is identified as an area of high susceptibility for impacts to groundwater. The Peacock barn site is located in an area of medium susceptibility.

[22] The Town has over 14,000 residents relying on groundwater with over 8,000 cubic metres of groundwater being used per day and the Peacock farm is identified as a potential contaminant source. The report confirms that intensive livestock operations can degrade groundwater sources if waste products are not adequately stored and properly applied. Areas that have shallow depth to the aquifer are more susceptible to potential livestock impacts.

[23] Given that the Peacock operation is in the Wellhead Protection Area and is also located in an area of high to medium susceptibility to the wells in question and given that the overburden aquifer has been assigned medium to high susceptibility, the consultant stated that it was essential to monitor activities within the wellhead protection areas to determine if there is a risk of contamination under current conditions. For this reason, if a permit is to issue, the County seeks a stay of the proceedings or a stay of the issuance of a building permit for a 90 day period to permit the County to examine the appellants' existing manure pit to determine if it is safe, to examine the building for compliance with safety requirements and to install measuring devices to monitor the effectiveness of the pit. The County also proposes to investigate the appellants' Nutrient Management Plan to determine whether the County's wells were taken into account in establishing the requirements of the Plan. All of these enquiries are proposed by counsel for the County to be conducted at the County's expense.

[24] Counsel for the appellants submitted that the leading case on the stay issue is ***Varnam v. Canada (Minister of National Health and Welfare)[1]***, which holds that to justify a stay the moving party must satisfy the court that (a) continuance of the action would work an injustice because it would be oppressive or vexatious to the moving party or would be an abuse of the process of the court in some other way; and (b) the stay must not cause an injustice to the responding party.

[25] With respect, this decision and the others cited by counsel for the appellants, refer to a stay that would have some final impact upon an action. However, the test for an interlocutory stay is quite different and was set out in ***RJR-MacDonald Inc. v. Canada (Attorney General)[2]***, where the court states that an interim stay may be granted when (a) there is a serious issue to be tried; (b) the moving party will suffer irreparable harm if the order is not granted; and (c) the balance of convenience favours granting the stay because the harm to the moving party outweighs the potential harm of the responding party.

[26] In ***Ottawa(City) v. Ottawa(City) Chief Building Official[3]***, the Divisional Court also dealt with a hog farm case, holding that the risk of environmental damage should be categorized as irreparable harm because of the "permanent loss of natural resources" and the public interest and public safety issues. On the balance of convenience, the court held that public health is of far greater importance than the harm to private economic interests. It should be noted that in ***Ottawa,*** as here, the applicant continued with construction in spite of the pending court action and with knowledge of the public health risks involved. Those factors led the court to grant the interim stay.

[27] ***Ottawa***is very similar to the case at bar, because the appellants have not only not considered the consequences of their actions on the Towns' drinking water, but even when the possible consequences were clearly defined, they continued to vigorously assert their rights without accommodating the public concerns that have been raised. In my view, even if the appellants are entitled to a building permit, this is a case for the exercise of the discretion in favour of granting a stay of the issuance of a building permit for a period of 90 days upon the terms proposed by the County.

CRYSTALLIZATION ISSUE

[28] The appellants argue that the Chief Building Official had no discretion to refuse to issue the permit because all of the statutory requirements had been fulfilled by the appellants at the time of the filing of their application on December 17th, two days prior to the passage of the By-law. Counsel for the appellants argues that the appellants' rights to a building permit crystallized on December 17th when they filed their application, at which time all of the requirements necessary for the issuance of the building permit had been satisfied.

[29] The respondent takes the position that by the time the Peacock application was considered in the normal course of business and within appropriate time parameters, the County had passed the By-law which amounted to "other applicable law", which prohibited him from issuing the Building Permit, in accordance with s. 8(2)(a) of *The Building Code Act*, 1992. That section provides:

s.8(1) No person shall construct or demolish a building in a municipality... unless a permit has been issued therefore by the chief building official

(2) The chief building official shall issue a permit under subsection (1) unless,

(a) the proposed building, construction or demolition will contravene this Act or the building code or any other applicable law;

[30] The court's jurisdiction in this matter comes from s. 15(3) of the *Building Code Act* which provides:

Where an application is made to a judge for a hearing under ss (1), the judge shall appoint a time for and hold the hearing and may rescind or affirm the order or decision of the inspector or chief official or take such action as the judge considers the inspector or chief official ought to take in accordance with this *Act* and the regulations, and for such purposes the judge may substitute his or her opinion for that of the inspector or chief official.

[31] Counsel for the appellants relies on the Ontario Court of Appeal's decision in ***Re Teperman and Sons Ltd. and City of Torontoet al[4]***. In this case, the applicant had applied to the Building Commissioner of Toronto for a demolition permit on May 7, 1974. At the time, the application complied in all respects with governing by-laws and was supported by the requisite material. However, the commissioner withheld the issuance of the permits on the grounds that some of the dwellings were still occupied. On June 28, 1974, legislation empowering a municipality to declare an area of demolition control was enacted and the City immediately declared the entire area of Toronto an area of demolition control. The commissioner denied the permit on the ground that the application was governed by the subsequent legislation. The Court of Appeal held that ***Teperman's*** right to a permit crystallized on May 7, and survived subsequent legislation in the absence of express or implicit language in the legislation for a retrospective effect. If **Teperman** was followed literally, the appellants may very well have been entitled to a building permit. However, there are aspects of **Teperman** that are distinguishable from the case at bar.

[32] In ***Teperman*** that there was significant administrative delay, or what subsequent cases have identified as bad faith dealings on the part of the municipality, which distinguishes the case from the case at bar. In addition, the disposition in ***Teperman*** involved an interpretation of legislative provisions quite unlike the legislative provisions governing the case at bar. For instance, s. 38(1) of the *Planning Act* gives a municipality extraordinary powers to plan appropriate planning strategies. It would not serve the spirit and purpose of the legislation if the courts were to either undermine the actions of municipal government in matters that are uniquely within their legislative competence or to place unnecessary obstacles in the way of their effective implementation.

[33] Finally, it should be observed that subsequent cases have not interpreted ***Teperman*** literally. Perhaps that is why it is difficult, if not impossible to reconcile the results in some of the crystallization cases referred to by counsel.

[34] For instance in ***Woodglen and Company Ltd and City of North York et al[5]***, an application for a building permit was refused even though the application complied with applicable zoning by-laws, on the ground that the proposed single family dwelling did not conform to a dated Official plan which had never been adopted by the municipality. On an appeal from the building official's decision, Haley CCJ. concluded that the official plan was not part of the "applicable law" and the chief building officer was therefore obliged to issue the permit. On appeal to the Divisional Court, 26 M.P.L.R. 40 at 45, Southey J. held that the trial judge was right to conclude that the permit should have been issued because "at the date of the application" the applicant complied with all relevant and applicable laws. The stated intention of the municipality to rezone to prohibit such construction at a future date was not a valid reason for refusing or postponing the issuance of a permit. The court went on to state that a judge sitting in review of the chief building official's decision is to do what the judge considers the inspector or chief official "ought to have done". In discussing the practice of permitting a municipality to adjourn a hearing in order to pass restricting legislation to affect the application in question, Southey J. added this further observation at p. 47:

Municipalities no longer have the need to delay an application for a permit in order that new zoning by-laws may be made effective, because they have the power under s. 37 of the *Planning Act*, S.O. 1983, c. l, to pass interim control by-laws, to be in effect for one year, when land use policies are being reviewed or studied in the municipality or in a defined area. Such by-laws may be passed without prior notice or hearing.

[35] I interpret that passage to mean that it was the view of the court, albeit in obiter, that passage of an interim control by-law subsequent to an application for a building permit could prevent the issuance of the permit.

[36] In ***H and D International Group v. Toronto[6]***, Corbett CCJ. held that an interim control by-law passed *after* the decision of the building commissioner to deny an application for a building permit was not "other applicable" within the meaning of s. 6(1) of the *Building Code Act*. However Madam Justice Corbett went on to hold that the rights of the applicant should be determined on the date of the decision of the Chief Building Inspector.

[37] Hogg CCJ. made a similar finding in ***Summit Glen Development Corp. v. Toronto (City)[7]***, concluding that the judge hearing the appeal was to place himself in the shoes of the official at the time the decision was made. In doing so he stated that he was following the law as stated by Southey J. in ***Woodglen*** and Corbett CCJ. in ***H and D***.

[38] In ***Quay West v. Toronto[8]*** the applicant developer sought an order for mandamus to compel the issuance of a building permit. The applicant had sought a building permit in August 1988, following which the respondent passed an interim control by-law which prohibited the proposed use. It was argued that the developer's right to a permit crystallized on the date of his application for a permit. If the permit should have been issued in August 1988, the subsequent passage of the Interim Control By-law, he argued, was not a valid ground for the subsequent refusal to issue the permit. However, the Divisional Court held that s. 34(9) of the *Planning Act* did not exempt the erection of buildings for which a permit ought to have been issued before the effective date of the zoning by-law but only buildings for which a permit has in fact been issued which was not the case here. Further the town had not been under a duty to issue the permit when the application was originally made because at that time there had been no site plan approval. Nor was there any lack of good faith or an improper purpose for enacting the interim control by law. In separate but concurring reasons, Saunders J. held that a mandamus order should not issue even where there might have been a prior duty to issue a permit, where an interim control by-law prohibited it. Leave to appeal this decision to the Ontario Court of Appeal was refused (1989), 47 M.P.L.R. 109n.

[39] Finally, in ***Sixteenth Warden Ltd. v. Markham (Town) Chief Building Official[9]***, the appellants sought to construct a warehouse membership club store and submitted a site plan to the town. Council convened a public information meeting on the site plan and subsequently did not approve the application. The chief building official subsequently refused to issue a building permit, citing the lack of a site plan agreement with the town. Council then passed an interim control by law prohibiting a retail warehouse in the Town. Day J. held that the town had failed to control development in a systematic and responsible way and acted improperly by trying to sabotage the applicant's application. In addition, the site plan agreement was not "any other applicable law" within the meaning of s. 6(1)(a) of the *Building Code Act*.

[40] In arriving at his decision, Day J. considered the decision of Blair, CCJ. in ***McDonald's Restaurants of Canada Ltd. v. Humm[10]***, which held that the legal right of a person to use his property as he sees fit and to have a building permit is to be judged as of the date of the hearing and is not in effect stabilized as of the date of

the application for the permit. Blair, CCJ. held that to hold otherwise, would preclude the council from legislating with respect to the subject.

[41] Day J. also considered the decision of Matthews CCJ in ***Greengables Holdings Inc. v. Scarborough[11]*** where he stated that the right of the applicant is to be judged as of the date of the hearing.

[42] In arriving at his conclusion, Day J. observed that the ***Woodglen*** decision was outside of the context of an interim control by-law passed subsequent to a permit application and refusal, and he went on to state:

Consequently, I do not consider myself bound by any decision which relies upon Woodglen as authority for the proposition that an interim control by-law passed subsequent to a permit application or refusal cannot serve to bar development.

[43] Day J. determined that the application before him did not revolve around when the applicant's rights crystallized but rather around the proper interpretation of s. 34(9) of the *Planning Act* which he found had been passed as a response to "the historic tensions between the competing interests of property owners and municipalities". In his analysis he relied on the Report of the Planning Act Review Committee (1977) which identified the object of the legislation as promoting the use of interim development control in a systematic and responsible manner that protects the rights of the affected parties. He then went on to consider the respondent municipality's actions and concluded that the municipality did not use the Interim Control By-law in a systematic and responsible way with a view to protecting the rights of affected parties and he ordered the permit to issue.

[44] In ***County Pork Ltd. v. Ashfield (Township)[12]***, the trial judge determined that the applicant's right to a building permit was to be determined as of the date of the filing of their application for a building permit and since an interim control by-law had been passed prior thereto, the appellants were not entitled to a building permit.

[45] The foregoing review illustrates that the ***Teperman*** principle has not been literally applied. Although some cases have followed it literally, those cases usually involved bad faith dealings on the part of municipal government. Where bad faith has not been a factor, the time frame for crystallization of rights has been expanded to the time when the building official makes his decision and in other cases the time frame has been extended even to the time of appellate review. The public health objectives that prompted the passage of the By-law mandates the adoption of the expanded time frame and I say that for several reasons. In ***Ottawa (City) v. Boyd Builders[13]***, the Supreme Court of Canada held that an applicant has a prima facie right to a permit, which may only be defeated if, prior to filing that application the municipality acted expeditiously and in good faith to express an intention to change the law. Although s. 8(2) of the Building Code Act has since been enacted to replace the **Boyd** principle, nevertheless the case is still useful in providing guidance as to the nature of the right that the filing of the application triggers. In my view, it is a technical right which in the circumstances of this case, must be subordinated to the greater public interest served by the Interim Control By-law. Walkerton was a wake-up-call, particularly to rural communities. The County, in good faith, and in a systematic and responsible way, has tried to respond to it by commissioning a study of the ground water issue and by freezing development until such time as the appropriate safeguards could be implemented to avoid the same tragedy occurring in the County. The courts must interpret such legislation in an expansive manner to give effect to its purpose and objectives. In the circumstances of this case, a technical application of the ***Teperman*** principle would not only undermine the county's legislative objectives but might endanger the lives and well-being of an entire community. Protection of the community is an overriding interest that trumps any lesser interests.

[46] Further, the appellants knew that when the County passed the resolution to authorize a ground water study, that the future of their intensive hog operation would be affected by the results of that study. Rather than waiting for the results of that study, they pressed ahead with their development hoping to secure the authorization to proceed before more stringent laws were enacted. However, reasonable people would agree that instant approval for complicated and controversial developments is neither expected by the public nor mandated by legislation. Common sense dictates that there will be a reasonable turn-around period for the proper evaluation of applications such as this, and only when that assessment has been made and the decision is made by the Building Official based on the law which pertains at that time, can it be said that the appellant's rights have crystallized.

[47] Finally, it seems reasonable to conclude that at the time the Building Official made his decision on this application, he was required to take into account all of the "applicable law" that pertained to the situation. That body of applicable law included not only the By-law properly enacted pursuant to s. 38(1) of the *Planning Act*, but as well, all other applicable statutory provisions and even common law principles. If he had not done so, he would have failed to discharge his duties under s. 8(2) of the *Building Code Act*.

[48] It is true that if a building official delays making a decision in order to thwart the rights of an applicant, different issues arise, but in the absence of bad

faith or unreasonable behaviour on the part of the building official, the law he is to apply to the application is the law that exists at the time of the making of his decision particularly where matters of public safety are raised. That being the case, the only way that the appellants' rights could be said to have crystallized would be at that point in time that the Building Official examined the application and concluded that it complied with all applicable regulations and requirements. At that point, the appellants would have been entitled to their building permit. However, the Building Official was not able to conclude that the Peacock application met all of the appropriate requirements and I cannot disagree or interfere with the Building Official's decision on the ground that the appellants' rights had crystallized before passage of the By-law.

I simply do not accept the submission that his decision, made 9 days after passage of the By-law gave retrospective effect to the By-law.

[49] However, the decision of the Building Official can be upheld on another ground. Section 30(1) of the *Ontario Water Resources Act*, R.S.O. 1990, c. O-40 ("OWRA") prohibits the discharge into water of contaminants that may impair the quality of water. The *Act* does not provide any exemption for agricultural operations, unlike the *Environmental Protection Act*, R.S.O. 1990, c. E-19 ("EPA") and the *Farming and Food Production Protection Act*, S.O. 1998, c. 1 ("FFPPA"). In ***R. v. Inco[14]***, the Ontario Court of Appeal held that the parties need not show actual impairment, but merely a capacity to impair. ***R. v. Sault Ste. Marie[15]***, defined the terms "discharge", "cause" and "permit". The discharging aspect relates to direct acts of pollution; the causing requirement is associated with activity by the defendant which is capable of control and which results in pollution; and permitting involves a passive lack of interference by the defendant, that is, failure to prevent an incident which it should have foreseen.

[50] Not surprisingly, the common law also supports the Building Official's decision. The appellants are using their farm in a manner that is potentially harmful to the entire Town of Simcoe. The law of nuisance holds that a landowner is permitted to use what belongs to him in a way that does not harm what belongs to someone else. In determining whether an activity constitutes a nuisance, the courts weigh the costs and benefits to society and emphasize the paramouncy of public over private interests. (see ***Miller v. Jackson[16]***). A public nuisance has been defined as any activity which unreasonably interferes with the public's interest in questions of health, safety, morality, comfort or convenience.[17] The celebrated English case of ***Rylands v. Fletcher[18]*** states that there is virtually absolute liability on owners who bring on their land anything likely to do mischief if it escapes and causes damage to a neighbour.

[51] The report commissioned by the Town shows how the appellants' operation could harm the Town's water supply if proper precautions are not taken. The Town has also demonstrated that known precautions available to the appellants have not been incorporated into either their present or future operation. That being the case, issuance of a building permit poses a legitimate expectation of actual harm to the community, in which case, the appellants' rights must succumb to the public interest. This is all the more true when there is no statutory obstacle to bringing a claim in nuisance against an agricultural operator for contamination of drinking water. Under the FFPPA, "normal farming practices" are protected. But contamination of the water supply of a community is not included in the statute's definition of a nuisance and certainly does not protect a farmer from nuisances actions arising from the contamination of the water supply of an entire community.

[52] Given the proximity of the appellants' intended hog operation to the Town's municipal water supply, and given the specific dangers identified by the Town's consultants and given the provisions of the common law and the OWRA, the Building Official was correct in rejecting the appellants' application.

THE BAD FAITH ISSUE:

[53] ***Quay West*** holds that a building permit may be issued in the absence of site plan approval if it is found that "the municipality was not acting in good faith or was refusing developmental approval for an obviously unlawful reason". The rule extracted from Sills J.'s decision in ***Forster v. Waterloo(City)[19]*** and***Quay*** is that although as a general rule, a building permit should not be issued until site plan approval has been obtained, the general rule may be displaced where extraordinary circumstances exist. Extraordinary circumstances have been held to include bad faith dealings by the municipality but according to ***Manchester v. North York (City) Chief Building Official[20]***, the category is not closed and it is argued that extraordinary circumstances here should apply to circumvent the application of the By law.

[54] In this case, the appellants argue that on October 23, 2001, the council considered and defeated a motion to impose an interim control by-law on intensive hog operations. However, because of continuing public pressure, and at the request of the County Manager, Paul Berry, the deputy Chief Building official, wrote a memo to other building department staff dated November 29, 2001 as follows:

We have been asked to detain any building permit applications for hog operations until further notice. If any new applications have been taken in recently, or do come in, in the next month or so, please contact myself or Wayne for instruction.

[55] On December 5, 2001 the General Manager of the County wrote to the mayor and members of council as follows:

Please be advised that County staff have been advised not to issue any building permits for intensive livestock operations until after Council deals with a report from this department in January, 2002. Appellants will be so advised.

Further, County staff are reviewing the building permits which have already been issued for intensive livestock operations. Specifically, staff will revoke those building permits where no construction has started and no nutrient management program is in place. This action is permitted by way of the Ontario Building Code Act. If you have any questions please call me.

[56] When the manager was questioned about these memos, he acknowledged that he was trying to slow things down on the issue of livestock operations until Council had an opportunity to deal with the issue. He further acknowledged that Council did nothing at their meetings in the month of December to counteract his actions.

[57] Counsel for the appellants also relies on a letter dated December 18, 2001 authored by him which was directed to the Chief Building official reminding him of his duties as the person designated to implement provincial legislation and urging him to consider the merits of the appellants' application as of December 17th, without regard to extraneous consideration. Counsel complains that a copy of the letter was not given to Council before the adoption that evening of the By-law.

[58] Counsel for the appellants suggests that the foregoing evidence constitutes proof that the appellant was not treated fairly by the building department of the county and that the aforesaid conduct is proof that the Building Official did not perform his duties as he is required to do, independent of any direction from the municipality.

[59] Clearly, County officials made building officials aware of their concerns over the risk of contamination of the Town's water and the potential for future curbs on development. I see nothing sinister in that. As a matter of fact, given the tragedy of Walkerton, vigilance in such matters is to be commended, not criticized. It would be indefensible to be critical of the type of communication that is necessary between various municipal departments to ensure competent management when the issues being discussed are public safety. I also agree that appearances are compromised to some extent when the Building Official, whose duty it is to act judicially and fairly in the discharge of his responsibility to implement provincial legislation is answerable to and supervised by a higher county official. However, it takes more than appearances to prove bad faith on the part of the municipality or that the Building Official was motivated by improper objectives. The Building Official in question was asked to what extent he was influenced by county officials regarding the Peacock application and the answer was not at all. The facts bear that out, because if the manager's intention was to delay the Peacock application, that did not happen. The decision was made in 8 working days in the busy month of December. The actual decision was made in compliance with the Interim Control By-law that had been passed just days earlier and it was so acknowledged. It may not have been the result that the appellants sought, but the decision was prompt and the reason explained. Accordingly, the bad faith argument is not supported by the evidence.

[60] However, since the category of extraordinary circumstances is not closed, there is another circumstances in the context of this case that would warrant consideration. At present, a Nutrient Management Plan does not affect the appellant's operations. That means any amount of manure can be spread onto the appellants' lands without regulation. If on the other hand, a building permit had been approved by the Building Official, a Nutrient Management Plan that had been supplied by the appellants with their application would have been triggered and controls would have been put into place.

[61] As tempting as that argument might be, it must be noted that counsel spent little time in argument explaining the technical aspects of hog farming. For this court to determine that a Nutrient Management Plan would better protect the Town's water than installation of the various devices urged by the Town that are available but were not included in the appellants' proposal requires a leap of faith that is unwarranted by the submissions. It is unfortunate that the appellants' operation at present is unregulated, but that is an issue which this court is ill-equipped to deal with and for that reason, I cannot conclude that this court would be justified in reversing the Building Official's decision on this ground.

NON-CONFORMING USE ARGUMENT

[62] Section 34(1) of the *Planning Act* authorizes local municipalities to pass laws prohibiting the use of land for or except for such purposes as may be set out in the by-law. However s.34(9) of the *Act* provides that:

(9) No by-law passed under this section applies,

(a) to prevent the use of any land, building or structure for any purpose prohibited by the by-law if such land, building or structure was lawfully used for such purpose

on the day of the passing of the by-law, so long as it continues to be used for that purpose: or

(b) to prevent the erection or use for a purpose prohibited by the by-law of any building or structure for which a permit has been issued under section 5 of the Building Code Act, prior to the day of the passing of the by-law, so long as the building or structure when erected is used and continues to be used for the purpose for which it was erected and provided the permit has not been revoked under section 6 of the Building Code Act.

[63] Municipalities are authorized to pass interim control by-laws under s. 38(1) of the *Act*, which provides:

38.(1) Where the council of a local municipality has, by by-law or resolution, directed that a review or study be undertaken in respect of land use planning policies in the municipality or in any defined area or areas thereof, the council of the municipality may pass a by-law (hereinafter referred to as an interim control by-law) to be in effect for a period of time specified in the by-law, which period shall not exceed one year from the date of the passing thereof, prohibiting the use of land, buildings or structures within the municipality or within the defined area or areas thereof for, or except for, such purposes as are set out in the by-law.

[64] Subsection (2) authorizes the municipality to extend the period of time for an additional year. Section 45.(1) of the *Act*, permits the committee of adjustments to authorize such minor variance from the provisions of a by-law passed under sections 34 or 38 of the *Act*, as in its opinion is desirable for the appropriate development or use of the land, building or structure, if in the opinion of the committee, the general intent and purpose of the By-law is maintained.

[65] Counsel for the appellants argues that s. 38.(1) only speaks of prohibiting the use of land, buildings or structures but does not preclude the erection of a structure or building. That being the case, it is argued that once the appellants had established the prior use of their 50 acre parcel for a hog operation, the Interim Control By-law could not be used to prohibit the appellants from proceeding with phase two, whether in the form of an addition to the existing building (if indeed the building existed at the time of the December 17 application) or in the form of a separate structure, as was contemplated by their second application. I cannot accept this submission.

[66] Section 38(1) is sweeping in its terminology and it empowers a municipality to prohibit the use of land, buildings or structures. In order to build a building, land must be used and that is what is prohibited by the Interim Control By-law. The way an intensive hog operation works as I understood counsel's submissions, is that waste produced by the hogs is stored in the ground under the barn to be erected. It is clear that in conducting the intensive hog operation contemplated by the appellants, the land must be used not only to support the proposed building but to contain the pit that will hold the waste. That use is precisely what the Interim Control By-law prohibits.

[67] In addition, it is clear that the purpose of s. 38(1) was to give municipalities the right to freeze development for a short period of time in order to study the impact of certain land uses with a view to developing future planning policies that would reflect the results of the study. This municipality passed the Interim Control By-law in order to study the impact of intensive hog operations on the drinking water of the community, and to the extent that this court can do so, the intention of the By-law should be upheld subject to the protection of prior non-conforming rights as specified by s. 39(8).

[68] Before proceeding to an analysis of the applicability of the Interim Control By-law to the appellants' property, I will deal with one preliminary matter - that of commitment to use. I do not think that anything turns on the fact that the first phase was not built and that technically speaking, the appellants had not actually used the property for a hog operation at the time of their second application. It has been held that commitment to a use is equivalent to a use for the purpose of the lawful non-conforming use provisions of the *Planning Act*. Similarly, any doubt as to the prior use should be resolved in favour of the owner. (see ***Cowichan Valley(Regional District) v. Yole[21]***).

[69] The appellants argue that once a non-conforming use has been established, an expansion of the use or an increase in intensity of the use, does not alter the non-conforming character of the use and therefore is still permissible. In support of that contention, counsel for the appellants relied on ***Re Hartley and the City of Toronto[22]***, ***Kiss v. Phil Dennis Enterprises[23]***, ***Regina v. Barry Humphrey Enterprises Ltd. et al[24]***, ***Cedarhurst Quarries & Crushing Ltd. v. Somerville (Township)[25]***, and ***Haldimand-Norfolk (Regional Municipality) v. Fagundes[26]***.

[70] In ***R. v. Barry Humphrey Enterprises Ltd.*** the court held that where use of a substantial part of vacant land constitutes a non-conforming use, it is sufficient to exempt the whole portion of the land. In reaching this conclusion, the Divisional Court followed the reasoning in ***Central Jewish Institute v. Toronto(City)[27]***, where it was held that the non-conforming use of only a portion of a building was sufficient to exempt the whole building. However, it should be noted that in ***Jewish***

Institute, the exempting section provided that no restrictive by-law passed under the *Act* should apply to any *building* that was used or erected prior to the By-law for any purpose prohibited by the By-law. What was protected was the building, not the use.

[71] In ***Humphrey***, the court applied the principle that the exemption applied to the whole building, not just the portion of the building actually being used for the prohibited purpose but observed at p. 552 that in the case of vacant land, it will be more difficult to determine the extent of the exempted use and the circumstances would have to be examined. In addition, the exemption was extended to the whole parcel for several other reasons. They were that the Town itself had confirmed that the whole parcel had been used for the prohibited use, there was a bone fide intention on the part of the owner to use the whole parcel and there was no separation between the portion actually being used from the remainder of the parcel.

[72] In ***Cedarhurst Quarries and Crushing Ltd.*** the appellants held two abutting properties, only one of which was actively being used for quarrying purposes. It was held that since the properties were abutting and the owner had acquired the abutting lot with the bona fide intention of using both lots for quarrying operations, which he could have done prior to the passage of the controlling by-law, there was no reason to confine the non-conforming use only to the parts of the land that were actively being quarried at the time the restricting by-law was passed. All of the land was exempt.

[73] In ***Duke v. Nanaimo(Regional District)[28]*** the issue was whether the owner had demonstrated an intention to use the land to raise 2,500 head of hogs and had begun implementation of the use prior to the passage of the restricting legislation. In holding that he had not Downs J. observed at p.15 that "..... partial use can be sufficient to establish an enlarged use when certain conditions are met".

[74] Counsel for the appellants also rely heavily on the ***Hartley*** where the court held that where a house and land was bought to be used for the purpose of a home, and had always been used for that purpose, whether it was occupied by three girls or thirty would not change the use or affect the exemption.

[75] In relying on ***Hartley***, it was argued that since the appellants were already using the land for a hog operation, increasing the number of hogs from 1000 to 2000 would not change the use. Counsel for the appellants further contends that the whole 50-acre parcel is exempt from the application of the By-law and that they are therefore free to build an addition or a separate structure on the 50-acre parcel.

[76] I cannot accept these submissions. Just because the appellants formulated a plan to use the 50-acre parcel for intensive hog operations and the municipality approved the first phase, does not mean that the municipality must necessarily approve the second. It seems to me that if the appellants do have a prior non-conforming use, then their exemption protects the status quo, it does not necessarily protect an addition or an enlargement to the status quo or a doubling of the structures on the property, particularly where to do so would involve a use of the land which may threaten the welfare of a community of 14,000 people. Put another way, the doctrine of legal non-conforming use cannot be used to protect expansion that necessarily entails such grave environmental and public safety dangers. I am fortified in this view by the decision of the Supreme Court of Canada in ***Saint-Romuald (Ville) v. Olivier[29]***:

In general, merely continuing the precise pre-existing activity, even at an intensified level, is clearly protected, but the intensification may be of such a degree as to create a difference in kind. A family farm which has a few pigs on the fringe of a town may continue as a legal non-conforming use, but the result may be otherwise if it is sought to expand its pork operation, into "factory in the country" type intensive pig farming. While in one sense the "use" has continued, in another sense its *character* has been so altered as to become, in terms of its impact on the community, an altogether different use.

[77] Mr. Justice Binnie observed that a non-conforming business in a residential neighbourhood should not be penalized for its success by losing its "acquired right" to operate, even if a by-product of that success is some increased traffic and noise. However, he went on to approve the following statement from *McQuillin, The Law of Municipal Corporations* (3d ed. 1976), vol. 8A, at p. 126:

The distinction is between an increase in the amount of business, even a great increase, which does not work a change in use, and an enlargement of a non-conforming business so as to be different in kind in its effect on the neighbourhood

[78] Certainly, the expansion of the appellants' use of their 50-acre parcel would double the risk to the community's supply of water. Such an intensification of the threat to the health and welfare of so many people, cannot possibly be justified. Now that the studies that were commissioned have fully demonstrated the health risk, now that the potential for violating statutory environmental provisions and common law rights is exposed, the potential illegality of the appellants' actions becomes a bar to such an extension of the use.

[79] Mr. Miazga's affidavit states that at the time of the Peacocks' first application, municipalities had little protection from intensive farming operations. This sad fact is confirmed by the Walkerton Report. The Honourable Mr. Justice O'Connor states under article 4.4.5.1 the following:

....at present in Ontario there is very little in the way of regulation directed to the protection of drinking water sources from the potential impacts of agriculture. For instance, there is no legally binding requirement concerning manure storage or management, nor is there an inspection program concerning manure management. There is considerably less environmental and water protection regulation of agriculture in Ontario than there is in many other Western jurisdictions.

[80] However, now that the full implications of the appellants' proposed development are understood, the Town is entitled to impose restrictions on any expansion of the use. Quoting once again from the Walkerton Report, Mr. Justice O'Connor states at p. 128:

A great deal of attention in Part 2 of the Inquiry focused on regulating the potential impacts of agriculture on Ontario's drinking water sources. My main recommendation is that every large or intensive farm, and every smaller farm located in an area designated as sensitive or high-risk, be required to develop a water protection plan that is consistent with the local watershed-based source protection plan (once the latter becomes available) and is binding on the farm's activities.

[81] In my view, the Walkerton tragedy requires a reassessment of commonly accepted principles and should be reason enough to cause a shift in emphasis when weighing private rights against public interest concerns. Although the appellants may very well have a prior non-conforming use, now that the risks of their existing use are clearly understood, they cannot reasonably expect to be able to expand the use without the imposition of appropriate safeguards. The resolution of this issue is mandated by the principle approved by the Ontario Court of Appeal in ***Ottawa (City) v. Capital Parking Inc.[30]*** that the doctrine of legal non-conforming is a shield against interference with acquired rights but cannot create new rights. Just as the applicant in ***Capital*** was required to comply with future regulations governing the use of its property, so too, must the appellants be expected to abide by future requirements of the county with respect to any expansion of its a potentially dangerous and lethal use of land.

[82] For all of these reasons, this appeal must be dismissed. I will entertain submissions as to costs if necessary on a date to be set by the local trial coordinator.

COURT OF APPEAL FOR ONTARIO

WEILER, BLAIR and ROULEAU JJ.A.

B E T W E E N :

MARILYN PEACOCK and REGINALD PEACOCK Applicants(Respondents)	**Keith M. Jones for the appellant**
- and -	
THE CORPORATION OF NORFOLK COUNTY Respondent (Appellant)	**Thomas A. Cline, Q.C. for the respondents**
- and -	
THE ONTARIO PORK PRODUCERS' MARKETING BOARD Intervener	**John M. Buhlman for the intervener**

Heard: December 13, 2005

On appeal from the judgment of Justice Eugene B. Fedak of the Superior Court of Justice dated November 19, 2004.

ROULEAU J.A.:

OVERVIEW

[1] The respondents, the Peacocks, operate a 1,000 head intensive hog operation and wish to double the capacity of their hog raising facility to 2,000 hogs. The facility will contain a large reservoir for nutrient storage. The Peacocks received approval of their Nutrient Management Plan, as required under the *Nutrient Management Act, 2002*, S.O. 2002, c. 4 (the Act), and corresponding Regulation 267/03 (the Regulation). Among the requirements of the Regulation is that the new nutrient storage facility must be at least 100 metres from a municipal well.

[2] The appellant municipality, Norfolk County, passed By-law 64-Z-2003 (the By-law) that prohibits siting intensive livestock operations and associated nutrient facilities within Sensitivity Areas 1 and 2. The appellant submits that the Peacocks' proposed expansion is located within Sensitivity Area 2, also referred to as the two-year capture zone. The two-year capture zone refers to an area from which it would take two years or less for contamination introduced at that point to reach the municipal well.

[3] Norfolk County takes the position that the Peacocks must comply with both the Regulation and the By-law and, that the By-law prohibits the proposed expansion. The Peacocks and the intervener, the Ontario Pork Producers' Marketing Board, take the position that the Regulation supersedes the By-law, pursuant to s. 61 of

the Act and only compliance with the Regulation is necessary.

[4] Section 61(1) of the *Nutrient Management Act* provides: "A regulation supersedes a by-law of a municipality or a provision in that by-law if the by-law or provision addresses the same subject-matter as the regulation." There are two main issues on appeal. The first is whether s. 61 specifies that, for conflicts between the Regulation and a municipal by-law, a test different from the impossibility of dual compliance test set out in *11957 Canada Ltée (Spraytech Société d'arrosage) v. Hudson (Town)*, [2001] 2 S.C.R. 241 is to be used. Second, whether the Regulation and the relevant provision of the By-law address the same "subject-matter".

[5] The application judge ruled in favour of the respondents having found that the Regulation addressed the same subject-matter as the By-law, and as such, superseded the By-law.

[6] For the reasons that follow, I would dismiss the appeal. Section 3.31.4(c) of the By-law does address the same subject-matter as the Regulation. As a result the Regulation renders that portion of the By-law inoperative.

SUMMARY OF RELEVANT FACTS

1) Background

[7] In response to public concern regarding the potential for groundwater contamination resulting from intensive livestock operations, Norfolk County initiated a groundwater study on December 4, 2001. An interim control by-law was passed on December 19, 2001 that temporarily prohibited the use of land, buildings and structures within Norfolk County for intensive livestock operations. The results of the groundwater study prompted the passing of By-law 64-Z-2003, which amended Norfolk County's Zoning By-law 1-1999. The By-law seeks to protect the municipal water wells by restricting land use in designated areas, which pose an unacceptable risk to the water source. It establishes Sensitivity Areas, ranked one through four where Sensitivity Area one represents the highest potential risk area. Land within each Sensitivity Area is subject to various land-use restrictions. The By-law lists three categories of land use (A, B and C) and each category lists various activities and their corresponding risk to municipal water supplies, category A posing the highest risk. Intensive livestock operations and associated nutrient facilities are not listed under any of these three categories. They are addressed by a separate provision, s. 3.32.4(c), which specifically prohibits such operations and facilities within Sensitivity Areas 1 and 2. The appellant submits the Peacocks' proposed expansion is located in Sensitivity Area 2, and is thus prohibited by the By-law.

[8] The province enacted the *Nutrient Management Act* in response to the Walkerton tragedy as part of an overall plan to protect Ontario's drinking water.[1] The Act provides province-wide standards governing the distribution, storage, spreading, record keeping of nutrients and the construction of their associated facilities. Under the Act, all farmers expanding or building new intensive livestock operations must obtain provincial approval of a Nutrient Management Strategy and Plan to ensure that their nutrient management meets the provincial standards.

The Peacocks have obtained this approval for their expansion.

2) Position of the Parties

[9] The specific area of concern between the Regulation and the By-law is the minimum distance separation required from a municipal well. Section 63(1)(b) of the Regulation prohibits the construction or expansion of a permanent nutrient storage facility, if the facility is located within 100 metres of a municipal well. The By-law prohibits nutrient storage facilities within Sensitivity Areas one and two. On the facts of this case, this has the effect of increasing the distance that the Peacocks expansion must be from the municipal well to more than 100 metres.

[10] The appellant submits that the By-law is necessary to protect the quality of water found in the municipal well and that while the Regulation prohibits construction within 100 metres it is silent on construction located in excess of 100 metres from a municipal well. Using the principle of enhancement, the appellant submits that the By-law enhances the environmental protections found in the Regulation and, thus both can co-exist. Any overlap between the Regulation and By-law can be resolved by use of the principle of accommodation. The appellant also submitted such principles should be invoked because of the precautionary principle, to prevent environmental degradation where there is a threat of serious or irreversible damage demonstrated by the groundwater study.

[11] The respondents submit that construction is permitted as long as the requirements delineated in the Act and its Regulations have been met and that it is irrelevant whether or not the By-law enhances the protection of a municipal water source. They submit that the proper test to be applied is not the impossibility of dual compliance test but rather the test stipulated in s. 61 of the Act.

[12] The intervener submits that the main issue is whether the By-law and the Regulation address the same subject-matter, as provided in s. 61 of the Act. It submits that the Regulation does address the same subject-matter as the By-law as both the substance and purpose are the same.

RELEVANT LEGISLATIVE PROVISIONS

1) The *Nutrient Management Act*

i) <u>Purpose of the Act</u>

[13] The purpose of the *Nutrient Management Act* is set out in s. 1 as follows:

1. The purpose of this Act is to provide for the management of materials containing nutrients in ways that will enhance protection of the natural environment and provide a sustainable future for agricultural operations and rural development. 2002, c. 4, s. 1.	1. La présente loi a pour objet de prévoir des façons de gérer les matières contenant des éléments nutritifs qui protégeront davantage l'environnement naturel et assureront le développement durable des exploitations agricoles et des collectivités rurales. 2002, chap. 4, art. 1.

[14] The *Nutrient Management Act* and the regulatory scheme enacted by Ontario Regulation 267/03 constitute a

comprehensive regulatory framework for the distribution, storage, spreading, record keeping of nutrients and their associated facilities.

[15] By enacting the *Nutrient Management Act* and Regulation, the province sought to balance environmental protection and sustainable agriculture. Intensive hog production generates large amounts of nutrients, and as such environmental concerns and risks cannot be avoided. These risks are managed through the *Nutrient Management Act* and Regulation.

[16] The nutrients generated by the hogs are accumulated in storage tanks and, periodically, are taken from the tanks and spread over agricultural land. A significant part of the Act and Regulation deals with the management of environmental concerns surrounding the storage and spreading of these nutrients. A focus of the environmental concern is the potential for the nutrients to contaminate both surface and ground water.

[17] Given the two competing interests, hog production and protection of the environment, the Regulation was prepared as a joint effort between the Ministry of the Environment and the Ministry of Agriculture and Food.

ii) Structure of the Act

[18] The environmental concerns relating to the storage of nutrients are addressed by the *Nutrient Management Act* and Regulation through a combination of

a) zones of prohibition;

b) construction and other safeguards with respect to storage tanks; and

c) the requirement that those generating and storing nutrients receive approvals which involve the filing and compliance with management plans and management strategies.

[19] These safeguards reduce the risk of tanks leaking into the environment and their contents making their way into surface or ground water.

[20] The *Nutrient Management Act* and Regulation deal specifically with the setback requirements from a municipal well. Section 63(1)(b) of the Regulation prohibits the construction or expansion of a permanent nutrient storage facility within 100 metres of a municipal well.

[21] In addition to compliance with the minimum setback provisions, all nutrients storage facilities must meet various construction standards. These construction standards, depending on the type of facility, take into account the hydrogeologic or geotechnical characteristics of the site and soil.

2) The Corporation of Norfolk County's By-law

[22] By-law 64-Z-2003 amended the municipality's Zoning By-law 1-1999 so as to prohibit placing nutrient storage facilities within a "two-year capture zone" or Sensitivity Area 2 as defined in the By-law. The two-year capture zone was determined as a result of an expert groundwater study which studied the tendency or likelihood of contamination reaching a specified position in the groundwater system after introduction at some

location above the uppermost aquifer. The limit of the two-year capture zone is the point from which it would take two years for contamination introduced at that point to reach the municipal wells.

[23] The By-law seeks to protect the municipal water wells by prohibiting certain land uses within the Sensitivity Areas established by the By-law. Any facilities built outside of the prohibited areas are not addressed by the By-law. Unlike the *Nutrient Management Act* and Regulation, the By-law does not impose specific construction standards nor does it provide for any record keeping. The By-law's zones of prohibition also apply to land uses other than intensive livestock operations such as petroleum products refining and various industrial uses. Because the proposed expansion of the respondents' hog operation involved the expansion of a barn and nutrient storage facility within the two-year recapture zone or Sensitivity Area 2 the municipality takes the position that such an expansion would contravene the By-law.

[24] The respondents take the position that they had applied for and obtained approval of their Nutrient Management Plan under the *Nutrient Management Act* and Regulation. Having complied with all of the statutory requirements set by the province, they maintain that they need not comply with the municipal By-law and can proceed with the expansion without municipal approval.

ISSUE

[25] The issue to be determined is whether the By-law, by prohibiting the establishment of an intensive livestock operation within the two-year capture zone, addresses "the same subject-matter as the Regulation" and is thereby rendered inoperative by s. 61 of the *Nutrient Management Act*.

ANALYSIS

1) Law

[26] The leading authority on reconciling overlapping provincial statutes and municipal by-laws is the Supreme Court of Canada's decision in *Spraytech*, *supra*. In that case, the court upheld the Town of Hudson's by-law regulating the use of pesticides despite the existence of provincial legislation in that field. After recognizing that in environmental matters the precautionary principle should apply, the majority of the court applied the impossibility of dual compliance test, taken from the federal-provincial context, to the provincial-municipal context. The court commented that there was a fine line between laws that legitimately complement each other and those that invade another government's protected legislative sphere. At para. 38, the court held the impossibility of dual compliance test requires first, that the municipal by-law deal with a similar subject as the provincial statute, and then that "obeying one necessarily means disobeying the other". Only then can the court find that a municipal by-law is inconsistent with a provincial statute. The court held that as a general principle, "the mere existence of provincial or federal legislation in a given field does not oust municipal prerogatives to regulate the subject-matter" (para. 39). However, the court also stipulated that the impossibility of dual compliance test would not apply when, as in the present case, the relevant provincial legislation specifies a different test (para. 36).

[27] In my view, this logically flows, in part, from the fact that municipalities are creations of the province and do not have constitutionally protected areas of operation as in the case of provinces and the federal government. As a result, the province can dictate how overlap in provincial and municipal regulation is to be resolved.

[28] In the present case, the test to resolve overlap between the *Nutrient Management Act* and Regulation and municipal by-laws is established by s. 61. Section 61 reads as follows:

61. (1) A regulation supersedes a by-law of a municipality or a provision in that by-law if the by-law or provision addresses the same subject-matter as the regulation. 2002, c. 4, s. 61(1).	61. (1) Les règlements remplacent les règlements municipaux d'une municipalité ou leurs dispositions qui traitent de la même question. 2002, chap. 4, par. 61(1)
(2) A by-law or a provision of a by-law that is superseded under subsection (1) is inoperative while the regulation is in force. 2002, c. 4, s. 61 (2)	(2) Le règlement municipal ou sa disposition qui est remplacé en application du paragraphe (1) est inopérant tant que le règlement reste en vigueur. 2002, chap. 4, par. 61 (2).

As a result, a by-law of a municipality or a provision of that by-law that "addresses the same subject-matter as the regulation," is rendered inoperative. Only if the by-law or a provision thereof does not address the same subject-matter will the impossibility of dual compliance test established in *Multiple Access Ltd. v. McCutcheon*, [1982] 2 S.C.R. 161 and applied in a provincial-municipal context in *Spraytech*, would apply.

2) Application to the Case at Bar

[29] The appellant argues that the application judge was in error and makes two principal submissions. The first is that, because the *Nutrient Management Act* and Regulation prohibit the construction of a nutrient storage facility within a 100 metres of a municipal well, their silence allows construction of a storage facility beyond the 100 metre zone. The municipality's By-law does not conflict with the Act and Regulation because it expands on the prohibition and enhances the protection of its municipal wells. As set out in *Spraytech*, it is legitimate for municipalities, as trustees of the environment, to enhance the protection provided by another sphere of government; they are at the level of government closest to the citizens affected and should thus be responsive to their needs. The impossibility of dual compliance test should be applied to this case. Since the municipal and provincial provisions are not in conflict, the by-law must be complied with. See *Spraytech*, *supra* at paras. 3, 27, 31-38.

[30] Secondly, in oral submissions, the appellant argued that the expression "addresses the same subject-matter" should be interpreted as meaning "addresses the same purpose." Since the purpose of the *Nutrient Management Act* and Regulation is nutrient management and protection of the environment is only an ancillary purpose, and the purpose of the By-law is the protection of the environment and the municipality's source of water, they address different purposes or "subject-matter" and s. 61 does not apply.

[31] I will address each of these submissions in turn.

a) Does the Impossibility of Dual Compliance Test Apply?

[32] As set out in *Spraytech*, the impossibility of dual compliance test only applies in the event that the relevant provincial legislation does not specify a different test. Section 61 of the *Nutrient Management Act*, in my view, specifies the test to be applied in the event that the Regulation and a local by-law or provision of a by-law address the same subject-matter. If they address the same subject-matter, s. 61(2) specifies that the by-law or provision of the by-law is "inoperative while the regulation is in force." Section 61 therefore clearly displaces the impossibility of dual compliance test.

[33] In terms of policy, this result is consistent with the intent of the Act. The Act sought to achieve a balance between environmental protection and sustainable agriculture. If municipalities were free to become involved and deal with the same subject-matter as is dealt with by the Act and Regulation and impose a higher environmental standard, then the balance created by the Act as intended by the province would be interfered with.

[34] This reading of s. 61 is reinforced when reference is made to the legislative debates. The Standing Committee on General Government discussions on June 3, 2002 made it clear that the drafters of the legislation did not intend to allow for municipal by-laws to enhance the environmental protection provided by regulation under the *Nutrient Management Act*. The proposal to amend s. 61 to allow the municipality to provide higher standards for the protection of the public or the environment than are provided in the Regulation was defeated.[2]

[35] Additionally, the debates make reference to Recommendation 14 from the Walkerton Report[3] as the basis for the government's insistence on s. 61. Recommendation 14 reads as follows:

Once a farm has in place an individual water protection plan that is consistent with the applicable source protection plan, municipalities should not have the authority to require that farm to meet a higher standard of protection of drinking water sources than that which is laid out in the farm's water protection plan.

[36] I conclude, therefore, that the impossibility of dual compliance test does not apply as it has been displaced by a specific provision in the legislation. To the extent that the by-law or provision thereof "addresses the same subject-matter" as the Regulation, the By-law or provision thereof will be inoperative.

[37] My conclusion is further reinforced by s. 8 of the Regulation. Section 8 reads as follows:

8. Subject to the Act, the requirements of this Regulation are in addition to and independent of the requirements in an approval, order or instrument issued under any other Act, other than a municipal by-law, and in the event of conflict, shall prevail. O. Reg. 267/03, s. 8.	8. Sous réserve de la Loi, les exigences du présent règlement s'ajoutent aux exigences d'une approbation, d'une autorisation, d'un arrêté, d'un ordre ou d'un acte délivré, pris, rendu ou passé en vertu de toute autre loi, sauf un règlement municipal, sont indépendantes de celles-ci et, en cas d'incompatibilité, l'emportent sur elles. Règl. de l'Ont. 154/04, art. 1.

The section provides that the Regulation under the *Nutrient Management Act* is in addition to and independent of the requirements under any other act but then goes on to specify that, in the event of conflict with other provincial requirements, the Regulation under the *Nutrient Management Act* prevails. Arguably, the section in effect says that the impossibility of dual compliance test is to apply in those situations. The section, however, specifically excludes municipal by-laws from the application of s. 8. This serves as confirmation that a test other than the impossibility of dual compliance test is to apply where the regulation and municipal by-laws overlap. This other test is the one set out in s. 61.

b) Do the Regulation and the By-law address "the same subject-matter"?

[38] In its oral submissions on this point, the appellant acknowledged that if the court were to define the "subject-matter" as the siting of the storage facilities, it would have to conclude that the Regulation and By-law address the same subject-matter. Its position, however, was that "subject-matter" as used in s. 61 in fact means purpose. When approached in that way, the court should conclude that the purpose of the By-law and the purpose of the Regulation are quite different. The purpose of the By-law is the protection of the municipal water source and the purpose of the Regulation is nutrient management.

[39] I agree with the appellant's submission that, in determining whether the Regulation and By-law deal with the same subject-matter, one should look beyond the direct legal effect of the two provisions and consider their object or purpose, that is, what are they dealing with and what are they seeking to achieve.

[40] The purpose of the statute is the goal pursued by Parliament in enacting it and can be identified either by looking at the broad context of the statute or by considering the problem that Parliament was seeking to remedy. Evidence of this purpose is normally found in the purpose statement of the statute. The effect of the statute is also relevant and considered by examining its practical or legal consequences. See *Samur v. City of Quebec*, [1953] 2 S.C.R. 299.

[41] In the present case, the Regulation and the By-law have similar underlying purposes and objects: to protect against water contamination of municipal wells. Each attempts to achieve this goal in different ways and each has its own unique focus and stated purpose.

[42] The Regulation attempts to achieve this goal by focusing on nutrient management of livestock operations. Depending on whether the livestock operation commenced before the legislation was enacted and the level of nutrients generated, the *Nutrient Management Act* and the Regulation provide a comprehensive scheme dealing with all aspects of the storage and spreading of nutrient materials. The Regulation therefore primarily deals with nutrients and how they should be managed in an agricultural operation. It balances the protection of ground water and the natural environment with the objectives of sustainable agricultural operations and rural development.

[43] The By-law attempts to make appropriate use of land planning by categorizing both the land in the municipality and its sensitivity to potential contamination.

It does so by controlling the land use activities that can be performed on such land. Specifically, it prohibits certain combinations of location and activity that were shown by the ground water study to pose a threat to the municipality's source of water. The By-law aims to protect the municipality's water supply and does so by prohibiting land uses within certain areas where those uses pose an unacceptable level of risk to groundwater quality. In doing so, however, the By-law includes a specific provision that regulates intensive livestock operations and associated nutrient storage facilities.[4]

[44] In oral submissions, the appellant argued that, because the dominant purpose of the *Nutrient Management Act* and Regulation is the management of nutrient materials in agricultural operations and the dominant purpose of the By-law is the protection of groundwater through land use planning, the purposes of the Regulation and the By-law are different. They should, therefore, be taken to address a different "subject-matter" and s. 61 should not apply.

[45] This interpretation, however, ignores the fact that s. 61 requires a comparison between the whole of the Regulation and the various provisions within the By-law. As set out above, the By-law contains a specific provision that regulates intensive livestock operations and associated nutrient storage facilities. This provision addresses the same subject-matter and has the same purpose as the Regulation. Section 3.31.4(c) of the By-law specifically prohibits the locating of "intensive livestock operations and associated manure facilities" on lands within the two-year capture zone or Sensitivity Area 2. The dominant feature of this provision of the By-law is the same as the purpose of the Regulation, that is, the management of intensive livestock operations and their associated manure storage facilities, and even has one of the same underlying goals, to prevent groundwater contamination.

[46] My conclusion that this section of the By-law and the Regulation address the same subject-matter, the regulation of livestock operations and, in particular the nutrients generated, is supported by the actions of the appellant. The record indicates that, after identifying the respondents' farm as a potential source of contamination, the appellant sent a letter to the respondents requesting that they cooperate with the appellant in retaining a qualified engineer to report on the structural integrity of the storage facility (barn and manure pits) and to identify any remedial work; install monitoring wells to evaluate the quality of the groundwater and prepare a specific plan for the spreading of manure which would include the potential for runoff, how runoff might affect the water quality of nearby creeks, and the extent of manure loading that the land can assimilate without adversely affecting the quality of surface water and ground water. These are precisely the types of activities that the Regulation addresses.

[47] Before concluding, I would like to comment on the approach taken by my colleague, Justice Blair. In essence he finds that the subject matter of the Regulation is "overall management of nutrient materials in relation to farming operations" and that the subject matter of the portion of the By-law in issue is "the prohibition of the use of land for intensive livestock operations and associated manure storage facilities in the two-year capture zone". In other words, he finds that the Regulation manages while the By-law prohibits. He then concludes that the

Regulation and By-law do not address the same subject matter and therefore, s. 61 does not apply.

[48] With respect, I do not agree with his conclusion. I say this for six reasons.

[49] First, as I have explained, the legislative debates make it clear that one of the reasons for including section 61 in the *Nutrient Management Act* was to give effect to Recommendation 14 contained in the Walkerton Report. As set out earlier, that Recommendation was that municipalities should not have the authority to require farms to meet a higher standard of protection of drinking water sources than that which is provided for in the plan approved under the provincial scheme. The interpretation of s. 61 made by Justice Blair thwarts this intention of Parliament.[5]

[50] Second, I disagree with the use of the pith and substance test in this case. The pith and substance analysis is used to characterize a law for the purposes of determining which head of power it falls within. See *Kitkatla Band v. British Columbia* (*Minister of Small Business, Tourism and Culture*), [2002] 2 S.C.R. 146 at para. 52. As such, it is an exercise in categorizing laws into existing and known heads of power. The pith and substance analysis attempts to determine the true purpose and effect of the law and then is used to ascertain whether the enacting legislature possesses the jurisdiction to enact. That is not an issue in this case. The municipality clearly has the authority to enact the impugned by-law. It is also appropriate, as set out in *Spraytech*, *supra*, that a broad approach to the interpretation of municipal powers be taken.

[51] The issue in this case, however, is not whether the municipality had the authority to enact it but rather, whether the properly enacted by law "addresses the same subject matter" as the Regulation. This demands a comparison of all of the similarities between the two laws and is a much different interpretive exercise than attempting to characterize the dominant feature of a law. By focusing only on the dominant feature of each law, the pith and substance analysis essentially ignores the subsidiary features of each law. This is acceptable in a division of powers exercise as each head of power is relatively broad and the analysis seeks only to slot the impugned law into one category or another. In this case, such an analysis is inappropriate as the test under s. 61 is much broader, and demands a comparison of the similarities of the law.

[52] Additionally, the most common and frequent legislative uses of the phrase "subject matter" indicate that the interpretation of "subject matter" should be content-driven. For example, the term is frequently used to describe the content of dispute, such as a hearing, inquiry, complaint, application, motion or arbitration and the content of a physical item such as a contract, program, lobbying effort or permit.

[53] In my view, these past legislative uses, although not determinative, suggest that "subject matter" is more than just the dominant feature, and must include an examination of the content, *i.e.* what is included in the By-law and the Regulation.

[54] Third, by limiting the application of s. 61 to situations where the dominant feature of the municipal by-law is the same as the dominant feature of the Regulation

the "overall management of nutrient materials in relation to farm operations", s. 61 is rendered to be virtually meaningless. Assuming that municipalities have the authority to enact by-laws that provide for the "overall management of nutrient materials in relation to farm operations", I doubt that a municipality would set out to do so in the comprehensive manner done by the *Nutrient Management Act* and Regulation. This means that, in practice, s. 61 would never apply. Municipalities would be free to manage each element of a farm's operation provided only that they did not do so by way of a by-law whose dominant feature was "the overall management of nutrient materials in relation to farm operations."

[55] Fourth, my colleague restricts the expression "subject matter" to the dominant feature of the Regulation, the overall management of nutrient materials. Although I agree that the broad purpose of the Act has to be taken into account in the interpretation of the expression "subject matter", I do not believe that it ought to be limited in the manner suggested. The expression "subject matter" is to be interpreted in its context. Section 61 applies where a by-law "addresses the same subject matter" [underlining added]. The English Oxford Dictionary defines the verb "address" as follows:

(a) write the name and address of the intended recipient on …

(b) direct in speech of writing (remarks, a protest, etc.);

(c) speak or write to, esp. formally;

(d) direct ones' attention to (address their concerns).

[56] The verb "addresses" is quite broad. In light of the differences in the nature of their authority and jurisdiction, municipalities and the Province can choose to "address the same subject matter" in very different ways. It follows that a by-law prohibiting the siting of nutrient storage facilities within a given distance of a municipal well is addressing the same subject matter as a regulation containing the same prohibition, albeit for a different distance. It is irrelevant, in my view, that the Regulation provides for an overall management scheme and that the zones of prohibitions are only one aspect of the numerous requirements.

[57] Fifth, if Part VII of the Regulation "siting and construction standards" had been adopted as a separate regulation rather than as a part of the comprehensive Regulation, the "subject matter" of that Regulation would be siting and construction standards of nutrient storage facilities. The dominant feature of this smaller regulation would be the same as that of the By-law's. Such a narrow interpretation of s. 61 is, in my view, at odds with the modern approach to statutory interpretation which requires that statutes be read "in their entire context and in their grammatical and ordinary sense harmoniously with the scheme of the Act, the object of the Act, and the intention of parliament." see Rizzo & Rizzo Shoes Ltd. (Re), [1998] 1 S.C.R. 27 at para. 21 citing E.A. Driedger, *Construction of Statutes* 2d ed. (Toronto Butterworths, 1983) at 87.

[58] Sixth, assuming that the pith and substance test is the correct approach, my colleague has concluded that the dominant feature of the Regulation is management while the dominant feature of the By-law is prohibition. Because the prohibition provisions in the Regulation are an incidental feature of the Regulation, they are not to be considered in the analysis. Even on a pith and substance

analysis, I do not reach the same conclusion. In a pith and substance analysis, the Supreme Court has held that "the effect of the law cannot be disregarded" See *Reference re Employment Insurance Act (Can.) ss. 22 and 23*, [2005] 2 S.C.R. 669 at para. 27. The analysis must look at both the purpose and the effect of the impugned law. *Kitkatla Band v. British Columbia* (*Minister of Small Business, Tourism and Culture*), *supra,* at paras. 53-54. The effect of the legislation includes both its legal effect and its practical effect. The court must look at the effects that flow from the impugned provisions themselves and then the "side effect" that flow from the application of the impugned provisions. The Regulation sets out a comprehensive scheme that manages all aspects of nutrients in an agricultural operation. The Regulation includes provisions about set backs from municipal wells, and where and when nutrient storage facilities can be located. The relevant portion of the By-law does exactly the same thing; it tells an agricultural operation where and when nutrient storage facilities can be located. The legal and practical effect of the By-law is to add supplementary requirements to the approval of the province under the *Nutrient Management Act*. As indicated, the Province's intent was not to allow municipalities to have this role.

[59] Before turning to my conclusion, I will address two additional matters. As indicated, s. 61 provides that we are to consider the By-law or a provision of the By-law and then determine whether this By-law or provision thereof addresses the same subject matter as the Regulation. Justice Blair is of the opinion that s. 61 does not provide that you compare the By-law or provision thereof with a provision of the Regulation. In my view, the structure of s. 61 is not indicative of an intention to limit the comparison of the By-law or provision thereof to the dominant feature of the whole of the Regulation. The section is structured in this way so as to minimally impair any by-law adopted by a municipality. Taken together, s. 61(1) and s. 61(2) provide that it is only the portion of the By-law that addresses the same subject matter as the Regulation that is rendered inoperative, not the whole of the By-law. Applied to the present case, this means that those portions of the municipality's By-law prohibiting other uses, such as foundries, petroleum product and refining remain in force. Only that portion of the By-law which addresses the same subject matter as the Regulation is rendered inoperative.

[60] Finally, in his concluding section, my colleague states that an interpretation of s. 61 that would render a municipality powerless to prevent the construction of a manure storage facility serving 2000 hogs beyond the 100-metre prohibition zone established pursuant to the *Nutrient Management Act* is absurd. I understand him to be saying that the result is absurd. To the extent that he is expressing concern that municipalities should not be powerless when faced with potentially dangerous threats to their sources of drinking water, I share the concern. In reaching my conclusion, I should not be taken as saying that municipalities should not have input when a nutrient management plan is put forward nor am I suggesting that the respondents and the Province or body charged with making a decision as to whether to approve the plan ought not to consult with the municipality and consider its legitimate concerns. I am simply saying that the *Nutrient Management Act* cannot be interpreted so as to lead to the result sought by the municipality.

CONCLUSION

[61] I conclude, therefore, that the portion of the By-law that prohibits the siting of an intensive livestock operation and associated manure storage facilities within the defined capture zone addresses "the same subject-matter" as the Regulation adopted under the *Nutrient Management Act* and is therefore inoperative. I would, therefore, dismiss the appeal.

[62] I would award the respondents their costs against the appellant fixed at $6,500 plus G.S.T. and disbursements. I would award no cost for or against the intervener.

"Paul S. Rouleau J.A."

"I agree K.M. Weiler J.A."

R.A. BLAIR J.A. (Dissenting)

OVERVIEW

[63] The issues in this appeal arise in the wake of the Walkerton water contamination tragedy.

[64] The Province of Ontario responded by enacting the *Nutrient Management Act, 2002* ("the NMA")[6] and corresponding Regulation 267/03 ("the Regulation").[7] The NMA and the Regulation contain an elaborate and comprehensive regulatory scheme for the management of manure and other "nutrient" materials associated with farming operations in an effort to prevent further water contamination problems in the Province.

[65] Public concern was local too. Reacting to those concerns in 2001, the County of Norfolk initiated a wide-ranging study regarding potential ground water contamination in 2001. The results of the study led the Municipality to enact By-law 64-Z-2003, which amends By-law 1-1999 of the former Town of Simcoe. By-Law 64-Z-2003 ("the By-Law") is designed to protect the Town's water supplies from contamination associated with a variety of land uses – including intensive livestock operations and the manure storage facilities associated with them – and to secure the long-term protection of the Town's potable water supply.

[66] Overlapping governmental requirements generated by these provincial and municipal initiatives are the source of the conundrum in which the respondents, Marilyn and Reginald Peacock, now find themselves.

[67] Mr. and Mrs. Peacock operate a large farming enterprise on the outskirts of Simcoe. Part of their enterprise consists of an intensive hog facility – presently housing one thousand hogs – on a fifty-acre parcel of land that is located a little north west of one of the Town's water well sites. Those wells supply a substantial amount of drinking water to the inhabitants of Simcoe.

[68] The Peacocks wish to expand their existing hog operation by doubling its size to one that will house two thousand hogs. To do so, they need to build an addition to their barn and to the manure storage facility associated with the operation.

[69] The proposed expansion brings into play the provisions of both the Regulation and the By-law. Under the NMA and the Regulation, the Peacocks must obtain provincial approval of a nutrient management plan, which they have done. They were able to obtain this approval partly because their facility is located eight hundred and twenty-three metres from the Town's well site and therefore does not run afoul of the requirement in s. 63 of the Regulation that a manure storage facility may not be constructed within one hundred metres of such a site.

[70] The proposed expanded facility does run afoul of the By-law, however. The By-law prohibits many land uses that are considered potential water contaminants within certain designated sensitivity areas. One of the prohibited land uses consists of "intensive livestock operations and associated storage facilities" (section 3.31.4 (c)). The Peacock's hog undertaking clearly falls within that category and it is located in what is known in the By-law as a Sensitivity 2 Wellhead Protected Area ("WHPA"). Such an area is defined, not by distance from

the wellhead, but by the time it is estimated a water contaminant will take to flow to the well from its source. A Sensitivity Area 2 is a two-year capture zone, that is, an area from which it would take two years or less for contamination introduced at the source to reach the municipal well.

[71] There is thus a tension between the operation of the Regulation (which does not prohibit the proposed expansion and pursuant to which it has been approved) and the operation of the By-law (which prohibits the expansion). The broad question raised on appeal, therefore, is whether the By-law is inoperative because the Province has occupied the legislative field in a manner that ousts the ability of the Municipality to enact a setback by-law, based on local conditions, and designed to protect the health and safety of its inhabitants from potential groundwater contamination.

[72] The Peacocks and the Intervener, the Pork Producers Marketing Board, argue that the By-law is not operative because it has been superseded by the NMA and the Regulation. In this respect, they rely on the provisions of s. 61 of the NMA, which state:

61(1) A regulation supersedes a by-law of a municipality or a provision in that by-law if the by-law or provision addresses the same subject matter as the regulation.

(2) A by-law or a provision of a by-law that is superseded under subsection (1) is inoperative while the regulation is in force.

[73] The primary issue on this appeal involves the meaning of the words "addresses the same subject matter as the regulation" in subsection 61(1). Justice Fedak accepted the Peacocks' arguments on the application and granted judgment declaring the By-law to be superseded by the Regulation. My colleague, Rouleau J.A., has also concluded that the By-law, and the provision of the By-law in question, address the same subject matter as the Regulation. Accordingly, he holds that the By-law is inoperative as it has been superseded by the Regulation, and he would dismiss the appeal.

[74] Respectfully, my reading of section 61 of the NMA, together with the applicable legislative framework and jurisprudence, lead me to the opposite conclusion. I would allow the appeal and set aside the order of the application judge for the reasons that follow.

FACTS

[75] The pertinent facts are reviewed clearly in the reasons of my colleague. Apart from the foregoing overview and whatever brief references may be necessary in the course of developing my conclusions, it is not necessary for me to recite them further.

ANALYSIS

The *Spraytech* Test

[76] I begin with a brief reference to the first issue dealt with by Justice Rouleau. That issue is whether the "impossibility of dual compliance" test enunciated in *Multiple Access Ltd. v. McCutcheon* [1982] 2 S.C.R. 161, and adopted in the provincial/municipal law context by the Supreme Court of Canada in *11957 Canada Ltée (Spraytech Société d'arrosage) v. Hudson (Town)*, [2001]

2 S.C.R. 241 ("*Spraytech*"), applies to resolve the tension between the provisions of the Regulation and those of the By-law.

[77] In this respect, I agree with the conclusion of my colleague, for the reasons he states. The *Spraytech* test only applies where the relevant provincial legislation does not specify a different test. Section 61(1) of the NMA does that. The test is whether the By-law or a provision of the By-law addresses the same subject matter as the Regulation. Only if the answer to that question is "No" is it necessary to consider the impossibility of dual compliance yardstick. If the answer is "Yes", the Regulation trumps the By-law, or its provision, which are superseded and rendered inoperative by virtue of s. 61(2).

[78] In my view, as I shall explain, the answer to the question whether the By-law – or, more accurately, section 3.31.4(c) of the By-law – addresses the same subject matter as the Regulation *is* "No". I turn to that question now.

The Approach to Determining Whether the Regulation and the By-law Address the Same Subject Matter

[79] The modern approach to statutory interpretation has been reiterated recently by the Supreme Court of Canada in *Bell ExpressVu Limited Partnership v. Rex*, [2002] 2 S.C.R. 559, at para. 26:

Today there is only one principle or approach, namely, the words of an Act are to be read in their entire context and in their grammatical and ordinary sense harmoniously with the scheme of the Act, the object of the Act, and the intention of Parliament.

See also, *Rizzo & Rizzo Shoes Ltd. (Re)*, [1998] 1 S.C.R. 27 at para. 21, citing from E.A. Driedger, Construction of Statutes 2d ed. (Toronto Butterworths, 1983) at 87.

[80] When what is at stake in the interpretation is whether the legislative direction of one level of government (here, the Province) will prevail over that of another level of government (the Municipality), it is appropriate in my view to consider, as part of the "entire context", the legislative framework in which the subordinate government's powers have been exercised, as well as the principles relating to the exercise of those powers. In this case, the respondent's By-law is specifically enacted in accordance with the power to pass zoning by-laws under s. 34(1) of the *Planning Act*,[8] but it also brings into play the broader power of municipalities to enact by-laws for the general welfare of its inhabitants pursuant to the *Municipal Act, 2001*.[9]

[81] Courts have commented several times recently on the need to take a broad approach to the interpretation of municipal powers, one that recognizes the importance of permitting municipalities to attend to the welfare of their citizens. In *Spraytech*, *supra*, para. 3, L'Heureux-Dubé J. commented that matters of governance are now examined through what she called "the principle of subsidiarity", that is, the proposition that law making and implementation are often best achieved at a level of government that is closest to the citizens affected and thus most responsive to their needs. This court expressed a similar view in *Croplife Canada v. City of Toronto* (2005), 75 O.R. (3d) 357 (C.A.). At para. 37, Feldman J.A. said:

I conclude that absent an express direction to the contrary in the *Municipal Act, 2001*, which is not there, the jurisprudence from the Supreme Court is clear that municipal powers, including general welfare powers, are to be interpreted broadly and generously within their context and statutory limits, to achieve the legitimate interests of the municipality and its inhabitants.

[82] As noted above, the By-law is specifically enacted pursuant to the Municipality's powers to enact zoning by-laws under the *Planning Act*. Section 71 of the *Planning Act* provides that in the event of conflict between its provisions and those of any other general or special Act, the provisions of the *Planning Act* prevail.[10] While I do not think that s. 71 of the *Planning Act* is dispositive of the question whether the Regulation (promulgated under the NMA) prevails over the By-law (enacted pursuant to the *Planning Act*), because the conflict is not between the provisions of the two Acts, the existence of the s. 71 override is supportive of the view that care should be exercised before the municipal legislative initiative – otherwise properly enacted – is declared inoperative. For a similar approach, see the "principles of accommodation" view expressed by Morden J.A. in *Attorney General for Ontario v. City of Mississauga* (1981), 33 O.R. (3d) 395 at 410-411 (C.A.).

[83] In considering the meaning of the term "subject matter" in s. 61(1) of the NMA – with the foregoing interpretive framework in mind – I take the view that "subject matter" in relation to a by-law, or a provision in a by-law, or a regulation, is not the equivalent of "any individual matter" that may be addressed or dealt with in the by-law, its provision or the regulation. "Subject matter" is broader than "an individual matter". It may be that the "subject matter" addressed by a by-law, or a provision of a by-law, is the same as an individual matter dealt with within a regulation – in this case, a minimum distance separation from the municipal well site. It does not follow, however, that the "subject matter" of the By-law or its provisions is necessarily the same as the "subject matter" of the Regulation. The "subject matter" of a by-law, or a provision of a by-law, or a regulation, in my view, has to do with its main thrust, or – to adopt the constitutional language used to resolve conflicts between levels of government – its pith and substance or dominant feature.

[84] That is the analytical approach I propose to adopt in considering the meaning of the phrase "addresses the same subject matter as the Regulation" in s. 61(1) of the NMA. In *Spraytech* the Supreme Court of Canada acknowledged that analytical tools used in division of powers jurisprudence can be useful in sorting out similar tensions between provincial (or federal) and municipal legislation: see para. 36. The constitutional "pith and substance" approach does not fit perfectly, of course, because, as Rouleau J.A. notes, what is at issue here is not an exercise "in categorizing laws into existing known heads of power . . . to ascertain whether the enacting legislature possesses jurisdiction to enact". However, what *is* at play here is the analogous exercise of determining what is the dominant feature (or "pith and substance") of the By-law, its provision, and the Regulation – the very exercise that underlies a division of powers debate.

[85] "Subject matter" is a term that is employed in a variety of ways by judges and in legislation. It has been used, for example, to describe a matter under dispute (the subject matter of a hearing, a complaint, a prosecution or a

proceeding), or to explain the overall content of a thing (a contract, a program, an order or judgment, policy or conveyance), or to illustrate the grant of jurisdiction over a general area. The application that is most apt to the present circumstances, however, is the use of "subject matter" to resolve constitutional conflicts between federal and provincial legislation on the basis of the pith and substance analysis.

[86] "Subject matter" has been variously defined in legal dictionaries. For instance, Black's Law Dictionary refers to it as "the issue presented for consideration."[11] Burton's Legal Thesaurus equates the term with the "tenor" of what is under consideration.[12] Weiler J.A. of this court has described the "matter" of a law, for purposes of constitutional analysis, as "its dominant or most important characteristic": *Adler v. Ontario* (1994), 19 O.R. (3d) 1 at 41 (C.A.), per Weiler J.A., dissenting. Other authorities have defined the "matter" of a law as its leading feature, its true meaning or character, its pith and substance: see *Union Colliery Co. of British Columbia v. Bryden*, [1899] A.C. 580 at 587 (P.C.); *Whitbread v. Walley*, [1990] 3 S.C.R. 1273 at 1286, cited in *R. v. Morgantaler*, [1993] 3 S.C.R. 463 at 481; *Consortium Developments (Clearwater) Ltd. v. Sarnia (City)* (1996), 30 O.R. (3d) 1 at 24 (C.A.); *Maple Ridge (District) v. Meyer* (2000), 77 B.C.L.R. (3d) 171 at para. 29 (S.C.); *Rothmans, Benson & Hedges Inc. v. Saskatchewan*, [2002] 10 W.W.R. 733 at para. 66 (Sask. Q.B.), rev'd on other grounds, [2005] 1 S.C.R. 188.

[87] When comparing the By-law, or its relevant provision, and the Regulation in this case, then, it is necessary to assess their "tenor", their "dominant or most important characteristic", their leading feature, their true character or pith and substance. First, though, it is necessary to consider precisely what the comparators are under s. 61(1).

[88] To repeat, s. 61(1) provides that a regulation supersedes a municipal by-law, or a provision of that by-law "if the by-law or provision addresses the same subject-matter as the regulation". The structure of the language is not parallel. It does not say: ". . .if the by-law or provision addresses the same subject-matter as the regulation or a provision of the regulation". Thus the relevant comparators here are the By-law, or the provision of the By-law in question (section 31.3.4(c)), on the one hand, and the Regulation as a whole, on the other hand. This supports the view, expressed above, that the comparison is not to be made between the subject matter of the By-law or its provision and an individual matter that may be dealt with within the Regulation, but rather between the "subject matter" of the By-law or its provision and the more extensive "subject matter" of the Regulation.

[89] This approach to the interpretation of s. 61(1) of the NMA using the "pith and substance" of the By-law, it provision, and the Regulation as an analytical framework is appropriate in the context of this case, in my view. It is a principled approach, comparing as it does the most important or dominant features of the provincial and municipal laws under consideration, and permitting various types of environmental protection initiatives to co-exist and achieve their intended purposes without frustrating the intentions of either the Legislature or the municipality. It also permits the competing approaches that are in play to be balanced in a fitting way. These competing approaches include the underlying provincial design, expressed in the NMA and Regulation, for protecting the environment by

developing a province-wide regulatory scheme to control and minimize the potentially poisonous effects of manure and other "nutrients" associated with intensive farming operations on drinking water supplies, while at the same time preserving agricultural development. But they also include the need for municipalities to be able to respond to the health, safety and general well being of their inhabitants, based on local needs and conditions – a part of the contextual analysis for the interpretation of s. 61(1) referred to above.

[90] Both these approaches have their merits. There is no doubt that the Province has the legislative authority to impose its will on the municipalities, should it choose to do so, and to impose a scheme that leaves no room whatever for local response. The question, however, is whether it has done so in this case.

[91] As noted above, courts have recently emphasized the need to take a flexible approach to the interpretation of municipal powers, recognizing the importance of the need for local governments to respond to local concerns. At the same time, I recognize that during the debates in Committee and in the Legislature prior to the enactment of the NMA, the importance of a consistent province-wide system of regulation was emphasized. Indeed, an attempt by the Opposition to amend what is now s. 61 to add a provision that a regulation would not supersede or render inoperative a by-law imposing higher standards for environmental protection, was defeated: Ontario, Legislative Assembly, Standing Committee on General Government, Official Reports of Debates (Hansard), G-3 (3 June 2002). This is evidence of legislative intention that the provincial scheme is to prevail when the competing provincial and municipal provisions address the same subject matter; in those circumstances, the municipality is not permitted to "top up" the provincial mechanism with a by-law imposing higher standards. However, the pre-enactment debates do not assist in resolving the "addresses the same subject matter" discussion, in my view.

[92] Moreover, the interpretation I have placed on the By-law and the Regulation does not frustrate the intention of the Legislature. The issue is not what members may have said in the course of parliamentary debates – although, as indicated, that may provide some evidence of what they intended – but rather the issue is what the Legislature's intention was as expressed in the enactment. Here, it does not appear that in the context of the setback provisions of the NMA and the Regulation, the Legislature gave effect to a "no enhancement by municipalities" intention. I make this observation because the NMA itself gives the Lieutenant Governor in Council the power to make regulations only respecting minimum distance separation requirements (s. 6(2)(u)). This suggests that other distance separation requirements that are not less than the minimums imposed by the Regulation may exist elsewhere. But where? "Minimum" in relation to what? The only other logical source of such requirements would be land use zoning by-laws passed by municipalities pursuant to the *Planning Act* R.S.O. 1990, c. P.13. It is implicit from this that municipalities may pass distance separation or setback provisions that will enhance or "top up" the minimums provided for in the NMA and Regulation where local conditions and the protection of the health and safety of the local citizens so require. I shall return to the issue of enhancement at the conclusion of

these reasons when I deal further with whether the *Spraytech* test has been met on the facts of this case.

Do the Regulation and the By-law Address the Same Subject Matter?

[93] In the meantime, and with the foregoing analysis in mind, I turn to a specific consideration of whether the By-law or its provision (section 31.3.4(c)) addresses the same subject matter as the Regulation. In my opinion, they do not.

[94] In this regard, I begin with the observation that the "purpose" of legislation is not the equivalent of its "subject matter". A pith and substance analysis looks at both the purpose of the legislation as well as its effect: *Kitkatla Band v. British Columbia (Minister of Small Business, Tourism and Culture)*, [2002] 2 S.C.R. 146 at 171. Here, it may be said that the By-law and the Regulation have similar purposes. However, they seek to achieve those purposes by different means, and therefore their effect and their "subject matter" are not necessarily the same.

[95] In broad terms, the purpose of both the Regulation and the By-law is to promote the protection of the environment and to preserve the health and well being of the members of society. Both do this in the context of preventing or minimizing the contamination of the water supply. This purpose is reflected in the purpose statement in both the NMA and the By-law:

NMA, s. 1

The purpose of this Act is to provide for the management of materials containing nutrients in ways that will enhance protection of the natural environment and provide a sustainable future for agricultural operations and rural development.

By-law – "Explanation of Purpose and Effect"

This by-law amendment [is] for the protection of municipal water supplies from contamination associated with certain land uses and to secure the long-term protection of a potable water supply for existing residents and businesses and to prohibit land uses from establishing in Wellhead Protection Areas or to ensure that certain uses can be established within Wellhead Protection Areas and have an acceptable level of risk to groundwater quality.

[96] Although the purpose of a statute, regulation or by-law sheds light on its subject matter, it does not itself define the subject matter. The subject matter of a statute, regulation or by-law is its dominant feature, or pith and substance.

[97] Here, the dominant feature, or "subject matter" of the Regulation is the management of farm operations involving manure and other materials containing nutrients, in accordance with the dictates of the NMA. Those dictates are accomplished through the complex and comprehensive provisions of the Regulation that include, amongst other things – as aspects of the nutrient management scheme – regulations respecting the use, application, holding and storage of nutrient materials, and the construction and location of holding and storage sites. The dominant feature of the Regulation is not the provision for a one hundred metre setback from municipal wells

(although that is admittedly an incidental feature). The dominant feature is the overall management of nutrient materials in relation to farming operations.

[98] The subject matter of the By-law (its dominant feature), on the other hand, is the prohibition of a lengthy list of land uses deemed to be potentially harmful to groundwater quality, in certain defined sensitivity zones relative to municipal wells. The subject matter of the particular provision of the By-law in question (section 3.31.4(c)) is similar in nature but more specific in its target; it prohibits the use of land for intensive livestock operations and associated manure storage facilities in the two-year capture zone.

[99] In short, the dominant feature or pith and substance of the By-law and its provision in question (set-back from wells for spreading manure and for the construction of manure storage facilities) compares to an incidental feature of the Regulation, but not to the subject matter of the Regulation, which is the overall management of nutrient materials. I do not see this as rendering s. 61 of the NMA meaningless. The Municipality cannot institute a regime of regulating or managing the nutrient material aspects of farm operations. It does not follow, in my opinion, that the Municipality may not utilize its zoning powers under the *Planning Act* to prohibit an activity that may be incidentally touched upon in a provincial regulatory scheme – as long as the "subject matter" of the by-law and the regulation in question are not the same.

[100] My colleague highlights the actions of the Municipality in sending a letter to the Peacocks after their farm had been identified as a potential source of contamination in the consultants' report, as support for the proposition that the By-law and the Regulation address the same subject matter. In that letter the Municipality requests the respondents to cooperate in retaining an engineer to report on the structural integrity of their manure storage facility and identify necessary remedial work, to install monitoring equipment with respect to groundwater quality, and to prepare a protective plan for spreading manure. My colleague concludes that this demonstrates the By-law is directed to the management and regulation of the nutrient material aspects of the respondents' farming operations.

[101] I do not interpret the letter in the same fashion. First, I note by its contents that it is directed at the Peacocks' *existing* hog operations – something over which the By-law could have no sway. Secondly, I read the letter as simply an attempt by the Municipality to work out a resolution of the specific groundwater contamination problem identified by the consultants report, with the respondents. The respondents are, after all, citizens of the Municipality with a substantial farming enterprise, and a resolution of the problem was in everyone's interest. I do not take the fact that the Municipality attempted to extract concessions it may not have been able to impose legislatively as any indication of the subject matter of the By-law the County of Norfolk subsequently enacted within its powers.

[102] As indicated above, what is to be compared for the purposes of s. 61(1) of the NMA is the "subject matter" addressed by the By-Law or its provision, on the one hand, and the "subject matter" addressed by the Regulation as a whole (not the subject matter of some particular provision in the Regulation), on the other hand. When that

comparison is done here, it is apparent that the dominant feature of the By-law and its provision (i.e., land use prohibition by means of a set back from wells in relation to intensive livestock operations and their associated manure storage facilities) compares to an incidental feature of the Regulation. However, it does not address the same subject matter as the Regulation (i.e., the management of nutrient materials).

[103] I conclude, therefore, that the Regulation does not supersede the By-law or its provision, and, accordingly, that the latter remain operative.

***Spraytech* Revisited**

[104] That is not the end of the matter for purposes of the appeal, however. Although the provisions of the By-law are not rendered inoperative by s. 61(1) of the NMA, it remains to be considered whether they are rendered inoperative by virtue of the "impossibility of dual compliance" test set out in the *Spraytech* decision, *supra*. In my view, they are not.

[105] The By-law, and its provision in s. 3.31.4(c), prohibiting the Peacock's proposed expansion facility survive the *Spraytech* analysis because there is no conflict between the municipal legislation and the Regulation in the "impossibility of dual compliance" sense; one does not prohibit what the other permits, or compel what the other forbids. The By-law does not say that a manure storage facility may be constructed within one hundred metres of a municipal well site, which the Regulation precludes. The Regulation does not say that such a facility may be constructed within the larger Sensitivity Area 2 provided for in the By-law; it merely says the facility cannot be constructed within the one hundred metre set-back from the well. As noted above, the setbacks provided for in the Regulation are only minimum setbacks. Once the "same subject matter" hurdle has been successfully overcome, there is nothing to prevent the respondent from enacting a by-law that provides for more stringent or enhanced requirements in terms of distance separation, based on local exigencies.

[106] Respectfully, the application judge erred in concluding there was an actual conflict in this case.

DISPOSITION

[107] It must not be forgotten that we are talking about "nutrients" here only in the euphemistic sense that legislators like to use in framing their enactments. What we are talking about is manure and its contaminating effects on surface and ground water. On the facts of this case, the Peacocks' new manure storage facility is to be constructed some eight hundred and twenty-three metres from the Town's municipal well site – significantly beyond the on hundred metre set-back called for in the Regulation. However, the logical extension of the argument made by the appellants and the intervener is that the Province has implemented the Walkerton Inquiry Recommendations by providing that a farmer can construct a manure storage facility to collect the waste from two thousand hogs – *three quarters of a million gallons* per year – within the length of a football field from a municipal well that provides drinking water to the community. And the local municipality is powerless to deal with the situation, even though they have a thorough and well-founded study demonstrating that, given local geological and soil conditions, contamination seeping into the soil from a

greater distance than one hundred metres will endanger the municipality's supply of drinking water. In my view, such an interpretive result is absurd and could not have been intended by the Legislature. For the reasons set out above, I do not believe that it was.

[108] I would accordingly allow the appeal, set aside the judgment of Fedak J., and dismiss the Peacocks' application.

"R.A. Blair J.A."

RELEASED: June 28, 2006

---

[1] See Ministry of the Environment, "Status of Part Two Recommendations Report of the Walkerton Inquiry" *Ministry of the Environment* (May 2005), online: <http://www.ene.gov.on.ca/envision/water/sdwa/status_part2.htm> The government has indicated that recommendations 10 through 15 have been implemented by the *Nutrient Management Act*.

[2] Ontario, Legislative Assembly, Standing Committee on General Government, *Hansard*, (3 June 2003) at G-48-G-51. The current s. 61 was referred to then as s. 60, but is substantively exactly the same.

[3] Ontario, Walkerton Commission of Inquiry, *Report of the Walkerton Inquiry*, part 2 (Toronto: Queen's Printer for Ontario, 2002) at 139, online: Ministry of the Environment <http://www.attorneygeneral.jus.gov.on.ca/english/about/pubs/walkerton/part2/>

[4] See Norfolk County, By-law, 64-Z-2003, *Wellhead Protection* Areas, (16 December 2003), s. 3.31.4(c):

Intensive livestock operations and associated manure storage facilities shall be prohibited on lands with Sensitivity 1 and 2 WHPAs. For the purpose of this Section, Intensive Livestock is defined as including 150 livestock units or 50 or more livestock units on a land base, which exceeds 2 livestock units per tillable acre available to the farm operation for application of nutrients.

[5] Justice Blair also referred to s. 6(2)(u) in stating that his interpretation of s. 61 is not contrary to the legislative intent. In my view, the existence of s. 6(2)(u) does not negate the clear legislative intent to create a system exclusively managed by the provincial government. Section 6(1) provides the Lieutenant Governor with a broad power to make regulations (a) establishing standards respecting the management of nutrients used by and on agricultural operations and (b) establishing standards respecting farm practices. Section 6(2) is a list of examples of areas in which the Lieutenant Governor *may* make regulations and specifically says, "without limiting the generality of subsection (1)." By providing in s. 6(2)(u) that the Lieutenant Governor can pass a regulation setting minimum distance separation between a manure storage facility and a place or feature such as a municipal well and then stating in s. 61 that a regulation supercedes a by-law addressing the same subject matter, the legislative intent revealed in the debates is reinforced rather than weakened. Those debates demonstrate an intent that when a municipal by-law imposes higher environmental standards for nutrient management, s. 61 is meant to make the Regulation supercede the By-law.

Peterson v. Ajax (Town) Fire Marshal

APPLICATION UNDER subsection 15 of section 18 of the Fire Marshals Act, R.S.O. 1990, c. F-17 as amended

Between
Hans Walter Peterson and Repla Limited, appellants, and
G. Gettins, as assistant to the Fire Marshal with the Town of Ajax, respondent

[1998] O.J. No. 3303
DRS 98-16383
Court File No. 750-97

Ontario Court of Justice (General Division)
Divisional Court
B. Wright J.
Heard: August 7, 1998.
Oral judgment: August 18, 1998.

Counsel:
Charles Wagman, for the applicant (appellants).
N. Cameron Murkar, for the respondent.

[para1] B. WRIGHT J. (orally):-- This is an appeal from a decision of the Fire Code Commission dated September 5, 1997, which confirmed in part a Fire Marshal's order dated March 14, 1997. The Fire Marshal's order was based on an inspection on February 24, 1997, of an industrial building located at 160 Dowty Road in Ajax. The order states:

> It was found that the Industrial building of combustible construction lacks fire separations required to contain the spread of fire, and in consequence

There are a number of boxes which can be x'd out and the two that are x'd out read:

> the building or structure is especially liable to fire.

And the next one is:

> the building or structure is so occupied that fire would endanger persons or property therein.

The order concludes:

> Therefore, pursuant to Clause (a) & (c) of Subsection 2 of Section 18 of the Fire Marshals Act, R.S.O. 1990, c. F.17 as amended, it is ordered that
>
> A dry sprinkler system be designed and installed throughout the building in accordance with N.F.P.A. 13 "Standard for the Installation of Sprinkler Systems", or subdivide the building into fire compartments not exceeding 1000 m2 by fire walls having not less than a four (4) hour fire resistance-rating. Prior to taking any corrective measures, a Building Permit must be applied for and obtained.

The inspection report of February 24, 1997 was not produced. There is no information at the time the order was issued, which provides particulars of the basis upon which the order in question was made. The building in question contains approximately 46,000 square feet of space, divided into three sections. The building was constructed in 1941 of all wood framing with metal clad exterior. It was used initially by the Federal Government making ammunition for the war. It was subsequently purchased by Cashway Lumber and used for the manufacture of windows and doors. The appellant, Repla Limited, purchased the building and used it for manufacturing windows until it moved its operations to another plant. The building currently has two tenants. The east section is used solely for the storage of mattresses and textile material. The only personnel on site are those delivering or taking out the stored items. The central section is occupied by a plastics extruding operation with six employees. The west section is vacant. The decision of the Fire Code Commission is brief and does not review the evidence upon which it makes its decision. The main parts of the decision state:

> The Tribunal accepts the evidence of the Ajax Fire

Department and Mr. Caskanette as to the present state of the subject property and the lack of fire separations. The evidence of Mr. Harpur, based on his inspection and subsequent report, confirmed the occupancy and combustible construction.

Based on the evidence presented, the Tribunal concluded that the combination of the construction and the existing occupancy present a fire hazard, unreasonably endangering life and property.

Although challenged by the owner, the Tribunal accepted the evidence of the Ajax Fire Department that the existing plywood partitions cannot be considered as fire separations whether they have breaches or not. However, when questioned by the Tribunal, the Ajax Fire Department stated that providing fire walls in the subject property would require extensive work and therefore is not the most practical solution. The Tribunal believes that the fire walls may provide a loss limitation but that the protection provided by the fire walls would not be sufficient to combat a fire within the divided sections.

Mr. Caskanette gave an inventory of the fire safety features of the building including means of egress, fire extinguishers and hydrants. The Tribunal did not consider these to be compensatory items and believes that the sprinkler protection ordered is the only viable fire safety solution for the subject property.

...

Accordingly, it is the decision of the Tribunal that the Order be modified as follows:

A sprinkler system shall be provided throughout the building, designed and installed in accordance with NFPA 13 standard, and approved by the Ajax Fire Department. All the required drawings must be submitted and the required building permits obtained prior to installation.

The work shall be completed and the installation operational by March 16, 1998.

[para2] As a first impression of a building constructed in 1941 with complete wood framing, a conclusion can be reached that such a building is more susceptible to fire than more modern buildings and therefore a sprinkler system should be installed. However, this building has never had a fire and therefore it is necessary to examine the basis upon which the Fire Marshal's Order was issued.

[para3] I have read the transcript of the proceeding before the Commission, along with the reports of the two professional engineers. I have difficulty finding the evidence upon which the Fire Marshall's Order and the decision of the Commission were made. Robert Harpur, P.Eng. prepared a report dated July 3, 1997, and testified for the respondent. His report is general in content and describes the building and its occupancy, but makes no comment on any existing fire hazard. In his oral evidence, Mr. Harpur's main concern appears to be that the owner does not have complete care and control of the building, since it is now occupied by two tenants. However, he presents no evidence that the presence of either tenant makes the building more liable to have a fire than when previously, totally occupied by the owner. I refer to Mr. Harpur's testimony from p. 37 of the transcript:

> ... As I was indicating earlier, I can assure you when Mr. Petersen operated under Repla Limited it was a single tenancy building, he ran a very clean shop, housekeeping was never a problem. As I was alluding to earlier and may have to offer into evidence, the spray booth that was in there did not use flammable liquids, therefore Section 5.12 of the Fire Code did not apply. Once again, instilling of the fact that he ran a very clean shop, a model type citizen, so to speak, ran a good operation.
>
> However, a big change came when he started renting the building out to more than one occupant. For example, ChemPlast, located in the middle, is a plastics type

factory. As you can see, in a recent fire in the City of Hamilton - although this facility is of a lot smaller scale, the hazards involved when a plastics factory of that nature or storage or whatever catches on fire what the results are, I don't think I have to go into much further explanation than that.

Also, the east end of the building is used for storage, as Mr. Petersen indicated, for mattresses, various types of fabrics or whatever. So you've got a mixed occupancy there with truly no fire separation with an adequate rating in between them.

[para4] It was unfair for Mr. Harpur to refer to another fire without evidence to show that because of the occupancy by a plastics company, the premises is more liable to have a fire.

[para5] The respondent Mr. Gettins gave similar evidence at p. 45 of the transcript:

Q. Anyways, Mr. Gettins, you stated in your evidence that the building was acceptable when it was occupied by one tenant, is that correct?

A. Essentially, what I was saying is that the occupant at that time, Repla Limited, complied with the Fire Code.

Again at p. 46 of Mr. Gettins' evidence:

Q. And because he changed the occupancy from a manufacturing point to one of dead storage and one of no storage and one of manufacturing of extruded plastic parts, you feel that this increased the hazard of the use of the building?

A. Because the building then became a multiple unit occupancy with not as much control and care. In other words, Mr. Petersen, when he ran it, showed a lot of control and care over his own building.

When he began renting it out to other occupants, there certainly wasn't the control and care as noted in inspection reports and violation served against them.

[para6] No inspection reports were introduced as evidence to support any increased hazard of fire because of the present occupancy of the building. Natural justice requires that all evidence which forms the basis of an order, such as made in this case, must be produced to persons affected by the order so that they will know the case they have to meet in their defence. The respondent has failed to comply with the rules of natural justice.

[para7] Returning to the transcript of Mr. Gettins' evidence at p. 64:

Q. What type of construction is that?

A. Combustible construction. With a storage warehouse on the east side of the building and a plastics factory located in the middle and miscellaneous storage by the owner in the west end of the building. Based on that criteria I felt it was especially liable to fire.

[para8] I raise the question, why because of those occupancies, is the building especially liable to fire? Mr. Gettins gives no reason for coming to that conclusion and his conclusion is not based on any evidence except the general statement that he puts forward.

[para9] At p. 75 of the transcript, returning to Mr. Harpur, and he is referring to Mr. Caskanette's evidence:

His description of the occupancy that is currently in the building, I would say, fairly represents what is there. The only problem is that with the building, subject to being rented on sort of a monthly basis, you don't know who the next occupants will be or what their conditions will be like. Lack of control or even knowledge of what

the tenants are doing is one of the problems here.

The building itself is also part of the problem, just because of the fact that it's combustible and of such a size. I agree with his comment, though, that it is not in a dilapidated condition, it has been well maintained. And certainly, to get into the building, you would have to either pry locks off doors or break windows or something of that nature. It's not what I would call an invitation to vagrants at this time.

[para10] Walters Forensic Engineering report dated September 2, 1997, prepared by Rene G. Caskanette, P.Eng., is more comprehensive than Mr. Harpur's report. His report in part states:

In my opinion, this building is not "so occupied that a fire would endanger persons therein", as stated in the Fire Marshal's order. In fact, the design of this building, and occupancy of this building, would allow for easy and safe egress of any building occupants in the event of a fire on the premises.

The warehouse section at the east end of the building contains normal combustible materials, and normal combustible construction. Appendix D defines combustible construction, as found in the Ontario Fire Code. There are no ignition sources in this section of the building, besides the normal building electrical and heating systems. The potential for a fire developing in this warehouse is very limited. In the event that a fire did occur in this warehouse, the entire east end of the building would likely be destroyed. The Fire Department would have ample water, and good access to the north and south sides of the building, to stop the fire from spreading.

The plastics grinding and extrusion operation in the centre of the plant does not contain any high hazard occupancies, which would create a higher than normal fire expectancy. In the event that a fire developed in this section of the building during production, the employees have access to manual fire extinguishing equipment to suppress the fire. In the event that the fire grew beyond their control, the Fire Department would have ample water and access, in order to control the fire before it spread beyond the centre section of the building.

The west end of the building which is unoccupied is not heated. There are no unusual fire hazards in this section of the building. The only potential ignition source is the building electrical system. The probability of a fire in this area is very low.

The doors are locked, and the building is equipped with alarm contacts on the doors, to detect vandal entry. This would reduce the chance of a vandal arson.

In the event that a fire occurred in the west end of the building, the Fire Department would have ample water and access to suppress the fire before it spread into the centre section of the building.

In my opinion, this building is not "so occupied that a fire would endanger property therein", in any unusual manner.

Similarly in my opinion, the building or structure is not "especially liable to fire".

This building was erected in 1942, and contained some very hazardous occupancies since its original date of construction. It was originally occupied as an ammunition factory, for shell filling operations for the war effort. It was later converted to wood working, with all the wood dust hazards associated with that occupancy. It also contained paint booths, and all the hazards associated with flammable liquid usage in such occupancies.

The occupancies today are very mundane in comparison to

> what the building has experienced in the past. In light of this history of the building, one would wonder why sprinklers were required in 1995, when they weren't required earlier to protect the much more severe fire hazards in the building at that time.

[para11] In summary, the evidence discloses that the Fire Marshal's office had no concern about this building being liable to a fire while it was totally occupied by the owner. The concern of the Fire Marshal's office, and the basis upon which the order was made, is the presence of two tenants in the building. However, there is no specific evidence that the occupation of the building by the two tenants has made the building more liable to have a fire. There is not sufficient evidence to support the Commission's broad general statement that:

> Based on the evidence presented, the Tribunal concluded that the combination of the construction and the existing occupancy present a fire hazard, unreasonably endangering life and property.

[para12] Where is the evidence that the occupancy of the building by the two tenants and the activities carried on by them, present a fire hazard. Some of the evidence presented was slanted toward the circumstances in the event of a fire occurring, and the effect of a fire on other persons or property. However, the order is based solely on the building being especially liable to fire, or, a fire would endanger persons or property therein. The consequences of a fire affecting others are not part of the order. For example, there are three other consequences, which are not part of the order, which deal with some of the evidence which was presented, which in my view, is irrelevant to the order issued by the Fire Marshal. Those consequences are:

> The building or structure is so situated as to endanger other buildings or property.
>
> There are in or upon the building or premises, combustible or explosive materials, or conditions dangerous to the safety of the buildings or premises or to enjoining property.
>
> A fire, once started, would seriously endanger the health or safety of any person or the quality of the natural environment for any use that can be made of it.

Those three consequences were not part of the Fire Marshal's order, although some evidence was adduced to support those consequences.

[para13] Since the evidence does not support the order of the Fire Marshall, nor the decision of the Commission, the appeal is allowed and the order of the Fire Marshal and the decision of the Commission are set aside. My decision does not preclude the Fire Marshal issuing another order based on proper evidence. Since the main concern of the Fire Marshal, as disclosed by the evidence, is the question of what type of tenants may use this building, with respect to possible hazards, I order that the respondent/owner shall advise the Fire Marshal's office of any change of occupancy of the building.

[para14] I have endorsed the Appeal book:

> For oral reasons given the appeal is allowed. The order of the Fire Marshall dated March 14, 1997 and the decision of the Commission dated Sept. 5, 1997 are set aside.
>
> Order to go that the appellants shall advise the respondent of any change in occupancy of the building.
>
> Costs fixed at $5,000 payable forthwith by the respondent to the appellants.

B. WRIGHT J.

Polla v. Toronto (City) Chief Building Official

Between
Marisa Polla, applicant, and
Yaman Uzumeri, Chief Building Official, Corporation of the City of Toronto and The Corporation of the City of Toronto, respondent

[2000] O.J. No. 4399
Court File No. 00-CV-194025

Ontario Superior Court of Justice
Molloy J.
Heard: August 18, 2000.
Judgment: November 21, 2000.

Counsel:
Kenneth C. Vaughan and Colin Vaughan, for the applicant.
Diana Dimmer and Naomi Brown, for the respondent.

MOLLOY J.:--

A. INTRODUCTION

[para1] The applicant owns residential property backing onto a ravine in Etobicoke. There is an existing house on the property in which she and her husband reside. However, they wish to build a new house on the lot and tear down the existing one. They began discussing their plans with City officials as early as 1997 and submitted their initial plans in 1999. In June 1999, in preparation for the anticipated construction, the Pollas built a retaining wall at the back of the property which had the effect of extending the usable land at the rear of the lot. The Pollas encountered numerous problems getting their plans approved. The Chief Building Official has refused to issue a building permit until site plan approval has been obtained. City Council has imposed conditions to site plan approval to which the applicant objects. In particular, the City has required that the retaining wall constructed in 1999 be removed, that the land adjacent to the setting wall be then restored to its natural pre-development state, and that the proposed dwelling be set back a minimum of 10 meters from the restored valley edge (which would require the building to be removed 2 meters north of its current proposed site). The applicant now seeks from this Court an order directing the issuance of a building permit and a declaration that the City Council had no jurisdiction to impose the conditions it did.

B. ENTITLEMENT TO BUILDING PERMIT

(i) The Test

[para2] Notwithstanding the many difficulties the applicant has experienced with various municipal officials and bodies, it is now clear that the proposed building complies with all zoning requirements and the Ontario Building Code. Under s. 8(2) of the Building Code Act, S.O. 1992, c. 23, the applicant is entitled to have a building permit issued unless the proposed building will contravene "any other applicable law". The City takes the position that "any other applicable law" includes site plan approval.

[para3] The Divisional Court held in Quay West v. Corporation of Toronto (1989), 47 M.P.L.R. 109 (Ont. Div. Ct.) at 111 that "as a general rule, a building permit should not be issued for a development in a site plan control area to which s. 40 of the Planning Act applies until site plan approval for the development has been obtained". The Court held that without such approval, the proposed building would contravene s. 40(4) of the Planning Act and the building permit could therefore not be issued. The Court further held (at p. 112) that a building permit could only be issued without such approval if there were "extraordinary circumstances" in which the municipal authority was acting in bad faith or for an obviously unlawful reason. I agree with the decision of Davidson J. in Shell Canada Products Ltd. v. Barrie (City) Building Official (1992), 11 M.P.L.R. (2d) 43 (Ont. Gen. Div.) that the Divisional Court decision in Quay West, leave to appeal from which was refused by the Court of Appeal, is binding upon me. Therefore, I can only direct the issuance of a building permit in this case if the City did not

act in good faith or if it acted for a "clearly unlawful purpose".

[para4] The City argues that it has not refused site plan approval and that these cases with respect to extraordinary circumstances therefore do not apply to it. I do not agree. The City has imposed onerous conditions to site plan approval. If those conditions have been imposed in bad faith or are unlawful, then the effect on the landowner is the same as if site plan approval had been withheld altogether. Therefore, if the City imposed the conditions in bad faith or if they are unlawful conditions, then the test identified in Quay West has been met and the building permit should issue.

(ii) Did the City Act in Bad Faith?

[para5] A finding that a municipal authority failed to act in good faith is a serious matter. The applicant alleges bad faith and has filed extensive affidavit evidence to support her position. The respondent denies bad faith and has filed extensive affidavit evidence supporting its position. I am not in a position on an application such as this to resolve the conflicts in the affidavit evidence. I am therefore not able to conclude that the City acted in bad faith in imposing the conditions it did on the site plan approval. I decline to make any finding on this point.

(iii) Are the Site Plan Approval Conditions "Clearly Unlawful"?

(a) Jurisdiction

[para6] A dispute as to conditions imposed upon site plan approval would normally fall within the jurisdiction of the Ontario Municipal Board ("OMB"). Site plan approval is governed by the Planning Act, R.S.O. 1990, c. P.13, s. 41(12) of which provides that where an owner of the land is not satisfied with any conditions imposed on site plan approval, he or she may require that the matter be referred to the OMB. The respondent submits that the core of this Court application is the landowner's dissatisfaction with the conditions imposed on site plan approval and that the landowner's only proper recourse is an appeal to the OMB. Alternatively, the respondent argues that even if this Court has jurisdiction to consider the matter, it ought not to do so, but rather should defer to the OMB's expertise in planning matters which better suits it to address these issues.

[para7] It is common ground that the landowner in this case is entitled to appeal to the OMB with respect to the conditions imposed on site plan approval. The question is whether the availability of that remedy ousts the jurisdiction of this Court, or should prompt this Court to exercise its discretion to refuse to hear the application.

[para8] The applicant has brought this application under s. 25 of the Building Code Act, which provides a right of appeal to this Court from a decision of a chief building official refusing to issue a building permit. The Chief Building Official in this case has refused to issue a building permit. This Court clearly has jurisdiction to decide that appeal. A landowner has a prima facie right to use her property as she sees fit. The issuance of a building permit is not a discretionary matter. If the legal conditions have been met, the owner is entitled to the permit. In Ottawa (City) v. Boyd Builders Ltd., [1965] S.C.R. No. 408, the Supreme Court of Canada held that, in light of this common law property right, the Courts have the power to grant a remedy notwithstanding the existence of alternative remedies before the OMB. There have been numerous cases in which Courts have dealt with whether a building permit should be issued, in the course of which issues with respect to site plan approval were also involved: Quay West v. Toronto, supra; Dominion Stores Ltd. v. Borough of Etobicoke (1982), 37 O.R. (2d) 661 (Ont. Div. Ct.); Revenue Properties Co. v. Toronto (City) (1984), 26 M.P.L.R. 165 (Ont. Co. Ct.); Re Luxor Entertainment Corporation v. North York (City) (1996), 27 O.R. (3d) 259 (Gen. Div.); Sixteenth Warden Ltd. v. Markham (Town) (1993), 12 O.R. (3d) 653 (Gen. Div.). In my opinion, the authorities are clear that this Court has jurisdiction to hear this application, notwithstanding the availability of an alternative remedy before the OMB.

[para9] The fact that I have jurisdiction to hear the application is not the end of the matter, however. It is open to me, as an exercise of discretion, to decline to hear the application if I am of the view that it is more appropriately dealt with by the OMB. This issue was raised before the Divisional Court in Dominion Stores Ltd. v. Borough of Etobicoke, supra, a case strikingly similar to the one before me. In Dominion Stores, a building permit was refused because the municipality had not given development control approval under s. 40 of the Planning Act. The municipality had refused to approve the development because it did not want to permit access to the supermarket from the two municipal roads at its boundaries. The landowner argued, successfully, that it was entitled by law to access its property from these roads and that the municipality was therefore withholding its approval for an unlawful reason. The respondent argued that the Court should refuse to hear the matter because the landowner had an alternative remedy in the form of an appeal under s. 40 of the Planning Act to the OMB, precisely the issue raised before me. The Divisional Court held (at p. 665):

> That section provides a means to arbitrate a dispute about the details of plans or drawings or the terms of an agreement. If this case involved a legitimate dispute about details or terms there would be great force to that argument. But in this case I think that there is no legitimate dispute. There is what seems to me to be nothing more nor less than unlawful obstinacy. Therefore, I do not think that the applicant is required to go to the Ontario Municipal Board before coming to this Court.

[para10] In the case before me, the applicant argues that the City has acted unlawfully in that it had no lawful basis for the conditions it imposed on site plan approval. There are no issues of zoning or planning policy. This is not a matter as to the details of plans or drawings. This is strictly a legal issue: i.e. whether as a matter of law, the City had legal authority to impose these conditions on site plan approval. Accordingly, it seems to me that the Court is in as good a position as the OMB to decide the issue. Further, since the decision whether I should proceed is an exercise of discretion, it is appropriate to consider all of the surrounding circumstances. The applicant has been through a long and sorry history with this property. There has been considerable delay and confusion at significant cost to the applicant. It is not necessary for me to find bad faith on the part of municipal officials to have considerable sympathy for the position in which the applicant was placed. She has waited long enough for the matter to be resolved. All technical requirements have been met. All that is left is a straight legal question which I have jurisdiction to deal with. In my view, it is in the interest of justice that I deal with the matter rather than deferring it.

(b) Analysis

[para11] It is absolutely clear on the evidence that Ms. Polla was legally entitled to erect the retaining wall at the rear of her property. Neither site plan approval nor a building permit was required, and none was sought. It is true that building the retaining wall resulted in the removal of some of the original vegetation in the ravine and no doubt that destruction, as well as the presence of the wall itself, has an environmental impact. However, the Polla property does not fall within the regulatory control of the Toronto Regional Conservation Authority ("TRCA") and is not subject to zoning by-laws restricting activity on the property that might adversely affect the ecological balance in the ravine. There was nothing the City or the TRCA could have lawfully done to prevent Ms. Polla from erecting the retaining wall. The question is whether they can now require her to tear it down as a condition of granting site plan approval.

[para12] Any authority of the City to impose conditions on site plan approval can only flow from the express provisions of s. 41 of the Act. That provision has been held by this Court and by the OMB to be restrictive, rather than discretionary, and to be concerned with conditions relating to the internal arrangements of buildings and facilities and provision of services and access to the specific development

under consideration: Sixteenth Warden Ltd. v. Markham (Town), supra, at p. 666; First City Shopping Centre Group v. Gloucester (City) (1990), 25 O.M.B.R. 91 at 101-102; Ontasian Investments Inc. v. Vaughan (City), [1996] O.M.B.D. No. 1125 at paras. 17-19. Further, there is no authority to withhold site plan approval based solely on aesthetic considerations: Barnet Investments Ltd. v. Toronto (City) (1985), 18 O.M.B.R. 343.

[para13] The respondent relies for its authority on ss. 41(7)(a)6 and 9. Those provisions state that the City may, as a condition of approval, require the owner of the land to

> (a) provide to the satisfaction of and at no expense to the municipality any or all of the following:
>
> 6. Walls, fences, hedges, trees, shrubs or groundcover or facilities for the landscaping of the lands or the protection of adjoining lands.
>
> 9. Grading or alteration in elevation or contour of the land and provision for the disposal of storm, surface and waste water from the land and from any buildings or structures thereon.

[para14] At this point it is relevant to consider the genesis of the conditions imposed upon site approval. At the early stages, there was some confusion as to whether the Polla property came within the control of the TRCA. Ultimately it was established that the TRCA had no jurisdiction as the property was outside its geographic area of protection. The TRCA is on record as saying that if the property had been under its control, its approval of the retaining wall would have been required and it would not have permitted it. At one point, the City's Planning Department staff had advised Mr. Polla that a full environmental impact study would be required as part of site plan approval. Staff later backed down from this requirement, but did negotiate a compromise solution with Mr. Polla that involved reconfiguration of the retaining wall and appropriate landscaping. The Planning Department prepared a Report dated May 9, 2000. The Report stated that the Official Plan for Etobicoke supported environmental protections for ravine and valley lands and that the expectation was that the Polla property would in the future be placed under the protection of the TRCA. However, at this point, the TRCA was without jurisdiction and there were no zoning by-laws in place to restrict the work undertaken by the Pollas at the back of their property, in particular the retaining wall. Also, the as-built works met the requirements of Works and Emergency Services Department for on-site drainage and storm water run-off. The Report noted the concerns of area residents as well as concerns of staff that the work done by the Pollas was not consistent with Etobicoke planning policy. It then referred to the compromise that had been worked out with the landowner and recommended that site plan approval be conditional on an agreement to that effect.

[para15] In the meantime, some of the area residents had been actively lobbying the City and municipal politicians seeking to prevent the development proposed by the Pollas and [to demand] the removal of the retaining wall. The Etobicoke Community Planning Council was to have considered the application for site plan approval at its meeting on May 24, 2000. On that date, however, it adjourned the matter to July 19, 2000 and requested, among other things, that staff obtain the comments of the TRCA for consideration of Council on July 19, 2000. At its next meeting, Council considered a letter from a representative of the TRCA which advocated remediation of the ravine to its state prior to the retaining wall, removal of the retaining wall, re-siting the proposed building 10 meters back from the restored valley edge (3 meters north of the proposed location) and revegetation of the area with native species. The City imposed all of these recommendations as conditions of site plan approval.

[para16] It is abundantly clear that the conditions imposed by the City are directed towards maintaining the natural environment of the ravine. This objective may well be, and indeed probably is, consistent with the policy expressed in the Official Plan. However, an Official Plan is not law. It is merely a statement of intention, which may or

may not be implemented by the municipality by the enactment of appropriate by-laws. Until such by-laws are passed, the Official Plan cannot be used by the municipality to regulate land use: Re Woodglen & Co. Ltd. v. City of North York (1984), 47 O.R. (2d) 614 at 617 (Div. Ct.); Re Steven Polon Ltd. v. Metropolitan Licensing Commission, [1961] O.R. No. 810 (H.C.J.). Therefore, the mere fact that protecting the natural state of the ravine is consistent with the Official Plan does not create jurisdiction in the City to protect the ravine through the site plan approval process. There must be explicit legal authority (through statute or by-laws) creating a right in the City to restrict the landowner's use of its property in the manner it has.

[para17] In my opinion, the City misused its site plan approval power for an extraneous purpose. There were no legitimate landscaping concerns other than as might be required if the retaining wall were torn down. The clear underlying purpose of the conditions imposed is to require the Pollas to remove a structure that violates no by-law or regulation, that required no approval to erect, that they were entitled by law to build on their property and which the City had no power to prohibit. Thus, the City has used power given to it for one purpose to achieve a result that it has no legitimate legal authority to compel. In Metropolitan Separate School Board v. Scarborough (City) (1996), 30 O.R. (3d) 186, the applicant school board had received site plan approval for the construction of portable classrooms. Later, the school board had signed a site plan agreement that provided for the removal of the classrooms. The classrooms were not removed and the City took steps to compel their demolition. One of the issues before the Court was whether the City had any authority to require the removal of the buildings as part of its authority to approve site plans under s. 41 of the Planning Act. Sharpe J. (as he then was) noted, "There is a long line of authority from the Ontario Municipal Board and from the courts rejecting attempts by municipal councils to expand the range of items which they can approve or require through the use of site plan control and site plan agreements." He then went on to hold that there was no authority under the guise of site plan control to order the removal of a building legally constructed. He held at p. 192:

> I cannot find in s. 41 any authority for the proposition that a site plan agreement can be used to limit the duration of approval accorded to plans for development. Subsections (4) and (5) deal with approval of plans and drawings. Section 41(7) lists a number of enumerated conditions that may be attached to approval for plans. These deal with matters such as widening of highways, access, walkways, lighting, fencing, grading, and elevations, while ss. (8) deals with widening of highways. It is apparent that the matters contemplated as the proper subject of a site plan agreement relate to approval of drawings and plans and amenities of this kind. The City is entitled to scrutinize the plans and attach conditions of the kind enumerated, but cannot use the power conferred by the section to exact terms not therein contemplated. There is no reference in s. 41 to limiting the duration of plan approval. By contrast, other provisions in the Planning Act expressly contemplate such temporal limitations: see, e.g., ss. 39(4) and 45(9). The assertion of the power to require a property owner to remove a structure which otherwise complies with applicable planning restrictions, building codes and standards must be firmly grounded in legislation. A requirement that a property owner remove an approved structure after a specified period differs significantly from the conditions contemplated by s. 41. Accordingly, I find that the term of the site plan agreement is not authorized by the Act. (Emphasis added.)

[para18] In Dominion Stores Ltd. v. Borough of Etobicoke (1982), 37 O.R. (2d) 661 (Div. Ct.), the Court held that the City had withheld site plan approval because it did not want to permit access onto the Dominion Store property from the two side streets abutting it. This was found to be unlawful. The landowner was entitled at common law to access the public roads touching its property and the City could not prohibit this without express statutory authority. Further, the landowner's legal right to a building permit could not be

thwarted by the City withholding site plan approval "for a reason not authorized by law". Galligan J. held at pp. 664-665:

> The record in this case is extensive. A close perusal of it leads me to the inescapable conclusion that the sole reason for the refusal to approve the development plans is that they provide for access to those local streets. It is my opinion that that reason is not one authorized by law. I do not think that a municipality is entitled to refuse developmental approval for an unlawful reason and thereby frustrate a land owner's prima facie right to issue of the building permit. The municipality withheld this permit for a reason that is not authorized by law. It follows therefore, that it must now issue it.

[para19] The situation in the case before me closely parallels the situation before the Court in Dominion Stores. Here, the Pollas were entitled by law to erect the retaining wall, just as Dominion Stores was entitled by law to access its property from the public road. Here, the City has attempted to interfere with the Polla's lawful construction of a retaining wall by refusing site plan approval, even though it had no statutory authority to prohibit the construction of the retaining wall in the first place. In Dominion Stores, the municipality attempted to interfere with the landowner's Store's lawful use of the public road to access its property by refusing site plan approval, even though the municipality had no statutory authority to prohibit access from the public road in the first place. In both situations, the municipality has used its power in respect of site plan approval to interfere with lawful use of the property it has no direct statutory authority to prohibit. The conduct of the municipality in Dominion Stores was found to be clearly unlawful. Likewise, in my view, the condition requiring the Pollas to tear down the retaining wall is clearly unlawful.

[para20] The requirement that the proposed home be moved further back from the ravine is also unauthorized. The proposed location does not violate zoning requirements. Site plan approval cannot be used to effect matters controlled by means of a zoning by-law: Martins v. Ottawa (City) (1996), 33 O.M.B.R. 372. In any event, if the retaining wall remains in place, the proposed location will be set-back more than 10 meters from the edge.

(c) Conclusion

[para21] I therefore conclude that the City exceeded its jurisdiction in ordering the removal of the retaining wall and the additional set-back of the proposed building. The conditions it imposed on site plan approval were clearly unlawful.

C. JUDGMENT

[para22] The conditions imposed by the City on site plan approval are unlawful and are therefore of no force and effect. The applicant is entitled to a declaration to that effect. The site plan approval conditions were the only remaining impediment to the issuance of a building permit. The chief building official has no discretion to refuse a building permit if all legal requirements for its issuance have been met. Under s. 25(4) of the Building Code Act the powers of a Judge on appeal from the refusal of a chief building official to issue a building permit include the power to substitute her own opinion for that of the chief building official and to take such action as the Judge considers the chief building official ought to take. I have already stated that it is my opinion that the proposed building does not contravene any applicable law. Accordingly, it is appropriate in this case to order that the building permit be issued, subject only to any normal administrative requirements.

[para23] The applicant is entitled to her costs. If counsel are of the view that for any reason the usual order for "costs on a party and party basis as assessed" would not be an appropriate disposition in this case, I can be spoken to in order to arrange an appointment for argument of the matter.

MOLLOY J.

Putnam v. Stirling-Rawdon (Township)

Between
Kirk Putnam, applicant (respondent by counter-application),
and
The Corporation of the Township of Stirling-Rawdon, respondent
(applicant by counter-application)

[2000] O.J. No. 734
Belleville Court File No. 1880/99

Ontario Superior Court of Justice
Belch J.
Heard: February 23, 2000.
Judgment: March 6, 2000.

Counsel:
Robert Reynolds, for the applicant.
David W. Demille, for the respondent.

[para1] BELCH J.:-- Is the required rear yard setback eight metres or only one metre in length? Can a garage be both attached and detached at the same time for purposes of use and setbacks? Mr. Kirk Putnam, the applicant, contends his garage is detached for setback purposes, and, as it is constructed one metre from the rear lot line, the location of the garage complies with the zoning by-law. The respondent municipality contends for this home office use within his garage to be valid, the garage must be a dwelling and its rear wall can be no closer than eight metres from the rear lot line, but if the office is shifted to the "house" then the zoning by-law is complied with as the rear wall of the "house" is more than eight metres from the rear lot line. The garage would now be considered a detached garage and its present rear wall, constructed one metre from the rear lot line, conforms to the zoning by-law.

[para2] However, the plot deepens. Mr. Putnam argues that because his "detached garage" with office is attached to his house by a tunnel beneath the surface and as the garage, house, and tunnel share a common foundation, they should be considered as one structure, "a dwelling". Therefore, his home office is a valid conforming use. Further, because the zoning by-law does not take a subsurface structure into account for setback purposes, his garage with the appearance of being "detached" satisfies the required distance of one metre to the rear lot limit.

[para3] It is my decision there is only one building on this lot, and Mr. Putnam's home office occupation is permitted in that building/dwelling. Further, the rear yard setback of eight metres is not complied with, however, having knowingly granted the building permit the municipality is now estopped from insisting upon the eight metre rear yard requirement.

Background

[para4] The subject property was purchased as a vacant lot in 1993 and a building permit applied for. The application proposed a residential house and detached garage, however, the application was accompanied and supported by building plans showing the two structures were to be attached by a below-grade concrete hallway joining the two basements. The structures were built in 1993 and the respondent's building inspector monitored the construction, including the location on the lot of the structures in relation to the lot boundaries.

[para5] Since November 1993, the two structures have been continuously connected by the hallway which has been used for daily passage back and forth. The hallway is approximately six and a half feet high and four feet wide. It has vinyl flooring and fluorescent lighting.

[para6] The applicant has used the first floor of the garage as a home office for his construction contracting business.

[para7] The zoning by-law is number 988/84. It permits a home occupation in a "dwelling" but not in a detached accessory building. If the house and garage are considered

for the purposes of the home occupation provisions in the by-law to be one connected structure, then the home office in the garage is permitted. If the garage is considered for the purpose of these provisions to be a detached accessory building as the municipality argues, then the home occupation would not be permitted.

[para8] Ms. Kathy Reid, the Clerk-Treasurer of the Township of Stirling-Rawdon in the County of Hastings, indicates that she received the application for the building permit for the dwelling and the detached garage and at the time of the application admits that the applicant did have rough plans indicating that the house and the detached garage would be joined by an underground tunnel. She states that after some consideration the Township was prepared to regard the building as a detached garage because it was only connected to the main dwelling by an underground tunnel. The advantage to Mr. Putnam was that he could then construct the detached garage within one metre of the rear lot line and it would remain in compliance with the zoning by-law. She further states that the applicant did not indicate in any way, either at the time he made the initial application or at the time he submitted the engineered drawings and received the building permit that he intended to use the garage for anything other than a garage. She states that it was her decision that if the garage looked like a detached garage, she would be prepared to treat it as a detached garage because the tunnel would not have any impact on the setback or lot coverage requirements of the zoning by-law.

[para9] The property is zoned second density residential (R2) which permits as uses a single family dwelling, a home occupation and an accessory building or use to a single family dwelling. Home occupation is defined to mean a use which is clearly incidental or secondary to the residential use of the dwelling and is conducted entirely within such a dwelling by an inhabitant thereof. Home occupation must be located within a dwelling which is defined as meaning a separate residential building containing one or more dwelling units.

[para10] In March of 1997 and in response to complaints from neighbours, the chief building official for the respondent attended at the property at a time when the garage was being renovated. That official says that in discussions with the applicant, he pointed out that home occupations were to be conducted within dwellings and accordingly the applicant changed his application to an application to permit interior renovations to the detached garage including insulation, wiring, strapping and doors for the purposes of a workshop in the lower level. In the view of the official, a workshop in the garage could be termed an accessory use and therefore a building permit could issue.

[para11] Later it came to the official's attention that the applicant was using the main level of the garage as an office. When he spoke to the applicant about this, the applicant provided him with a letter to the effect that:

> Without prejudice against us, we are willing to work with you and agree to comply with the by-law as you interpret it.
>
> In stride with your request that the office for our business be in the house, we have removed the sign from the shop area and have attached it to the front of the house. We have also set up a temporary office in the house. We are contemplating several different designs to create a permanent office space in the house and this may take some time.
>
> We know you will be understanding and give us an appropriate amount of time to have this work finalized ...

[para12] Apparently, the applicant and respondent have been involved in a running feud since 1997.

The Litigation

[para13] The applicant caused to be issued a Notice of Application under Rule 14.05(3)(d), (g) and (h) of the Rules of Civil Procedure. He has made application for:

(a) a declaration that the home office use being carried on by the applicant in the garage on his property at 189 Church Street, in the Village of Stirling is a home occupation permitted under the respondent's Comprehensive Zoning By-Law 988/84;

(b) a declaration that the rear yard setback for the said garage complies with the setback requirements of the aforementioned By-Law;

(c) costs.

[para14] The grounds for the application are that the R2 zoning permits a home occupation in the property. The applicant carries on a home office occupation in his former garage. The applicant and the respondent disagree as to whether the zoning by-law permits the home occupation to be carried on in the garage. The applicant seeks this court's assistance in the form of a determination of this issue and a declaration further to that determination. In addition, and depending on the ruling on the foregoing, there may be a dispute between the parties as to whether the garage complies with the rear yard setback requirements imposed by the zoning by-law. The applicant therefore seeks a determination of that issue from the court as well and a declaration further to that determination.

[para15] The respondent has countered with an application of its own, pursuant to Rule 14.05(3)(d) and (h) of the Rules of Civil Procedure.

[para16] The respondent's application requests an order restraining the applicant or anyone else using the garage located at 189 Church Street, Stirling, Ontario for a home occupation contrary to the Comprehensive Zoning By-Law No. 988/84.

[para17] The grounds for this counter-application are that

(a) the by-law permits a home occupation in the R2 zone, provided the home occupation is located entirely within a dwelling;

(b) the applicant, it states, is operating a business out of an office located on the main floor of an accessory building which is not permitted by By-Law No. 988/84;

(c) in the alternative, if the building is attached to and part of the dwelling unit, the building is too close to the rear lot line and cannot be used for a home occupation.

[para18] The applicant states that cross-examination of the representatives of the respondent municipality produced a number of admissions supporting the applicant's position as to the proper interpretation of the by-law. For example, the respondent's planner agreed that the question of whether or not a home occupation is permitted comes down to the issue of whether it is located within a dwelling and that the determination of whether a particular structure is a dwelling depends on the definitions of such terms as "building" and "dwelling" contained in the by-law. Further, the chief building official/by-law enforcement officer agreed that the garage, house and sub-surface corridor constitute one structure and accordingly that structure falls within the definition of "building" in the by-law, and since the structure contained a dwelling unit it follows that it falls within the definition of a "dwelling" in the by-law. The applicant argues that if the applicant's office is contained within a dwelling then it is a permitted home occupation since it is located within a dwelling.

[para19] As to the second issue, it is the applicant's position that the garage is subject to the rear yard setback requirement of one metre applicable to detached buildings because, for the purposes of the setback provisions of the by-law, it should be regarded as a detached accessory building. He argues that the respondent's Clerk-Treasurer confirmed that it was and is the respondent's position that it is appropriate to regard the garage as detached for the

purposes of the yard provisions of the by-law, even though it is actually part of one structure, because the sub-surface connecting corridor has no impact on the coverage and setback concerns addressed by the yard provisions of the by-law, and it follows then that the garage's one-metre setback complies with the by-law's rear yard requirement.

[para20] Finally, the applicant argues there is no inconsistency between the position that the existence of the sub-surface corridor connecting the house and garage into one structure should be taken into account for the purposes of the use provisions of the by-law, including the home occupation provisions, but not taken into account for the purposes of the yard provisions of the by-law. He points to the fact that the respondent's Clerk-Treasurer and Planner agreed that the existence of sub-surface structures such as the corridor joining the house and the garage is properly taken into account by the use provisions of the by-law, but is properly not taken into account by the yard provisions.

[para21] The respondent argues as follows:

(a) Firstly, a dwelling must comply with the regulations for dwellings in the R2 zone. In this case, a single family dwelling must have a minimum rear yard of eight metres. The garage in this case is only one metre away from the rear lot line. Consequently, because a home occupation can only be conducted in a dwelling and a dwelling can only have a minimum rear yard of eight metres, a home occupation can only be conducted in a dwelling that is at least eight metres from the rear lot line.

(b) Secondly, an accessory building is a subordinate building or structure located on the same lot as a principal building and includes a private garage. Accessory buildings are permitted in the R2 zone and the minimum rear yard for an accessory building that is not attached to the principal building is one metre. However, a home occupation cannot be conducted in an accessory building that is not attached to the principal building because a home occupation can only be located within a dwelling.

(c) Thirdly, if an accessory building is attached to the main building, the front yard, side yard, and rear yard and area requirements of the by-law are to be complied with as if the accessory building was part of the main building. In other words, if the accessory building, ie garage, is considered to be attached to the main building it has to comply with the yard requirements for the main building, ie dwelling. As a result, if the garage is considered as an accessory building attached to the dwelling, it has to comply with the rear yard requirements for the dwelling which in the R2 zone is a minimum of eight metres.

The Authorities

[para22] The applicant relies firstly on Wilson v. Jones (1968), 68 D.L.R. (2d) 273, a decision of the Supreme Court of Canada. In that case, Mr. Justice Spence remarks:

> I have come to this conclusion realizing that a by-law restricting the use of land must be strictly construed and that any doubt as to the application of the by-law to prevent the erection of a specific building should be resolved in favour of such proposed use. No authority need be cited for each of these propositions. These principles, however, need only to be applied when upon the reading of the whole by-law there is an ambiguity or difficulty of construction.

[para23] Secondly, in the Supreme Court of Canada decision Bayshore Shopping Centre v. Nepean (1972), 25 D.L.R. (3d) 443, again Mr. Justice Spence speaking for the Court, states:

> I find little assistance from decisions which purport to indicate the philosophic attitude which the Court should adopt in construing zoning by-laws. No authority need be cited for the proposition that a man's property is his

> own which he may utilize as he deems fit so long as in such utilization he does not commit nuisance, entrap the unwary, or act in breach of statutory prohibitions, and therefore, by-laws restrictive of that right should be strictly construed. Yet it has been said that modern zoning provisions have been enacted to protect the whole community and should be construed liberally, having in certain the public interest: R. v. Brown Camps Ltd. (1969), 8 D.L.R. (3d) 502, [1970] 1 O.R. 388 [1970] 2 C.C.C. 363; Re Bruce and City of Toronto et al., (1971), 19 D.L.R. (3d) 386 at page 391 [1971] 3 O.R. 62.
>
> But such statements usually were made when the court was considering an application to permit the encroachment into a residential zone of some building which it was alleged would seriously affect the amenities of the life of the residents thereof ...

[para24] The thrust of the applicant's argument is that if there is an ambiguity within the by-law then the by-law must be strictly construed against the municipality.

[para25] The respondent argues there is no ambiguity in the by-law. Simply stated, a home occupation takes place in a dwelling, the rear wall of which cannot be closer than eight metres to the rear lot line. The respondent relies upon the reported decision Haldimand-Norfolk (Regional Municipality) v. Painter [1997] O.J. No. 3814, a decision of the General Division of the Ontario Court of Justice (now the Superior Court of Justice). Referring to paragraph 19 of that reported case, the respondent argues that reading the present by-law as the applicant requests would lead to absurd results. As the learned Justice stated in that case:

> This would lead to absurd results. And this is one of the golden rules of statutory interpretation: where one of two interpretations might lead to absurd results, one is to prefer the one that does not produce such absurdities.

Analysis

[para26] Mr. Reynolds for the property owner invites the court to make a two-stage analysis - use and setback. In his cross-examination of the municipality's Clerk he elicits that:

(a) the municipality approved a structure consisting of a house, garage and sub-surface corridor;

(b) a structure is a building under the by-law s. 3.13;

(c) this building contains a dwelling unit;

(d) the entire "structure" contains a dwelling;

(e) a home occupation is allowed in a dwelling; and

(f) therefore, a home occupation use in the "garage" is permitted because it takes place in the structure.

[para27] The second stage, the yard provision setback stage, begins again with a cross-examination of the Clerk. Ms. Reid confirms:

(a) section 3.51 of the by-law in defining gross floor area, excludes basement or cellar;

(b) section 3.74 states that in determining lot coverage you exclude any part of a building or structure which is constructed entirely below grade;

(c) a yard in s. 3.149 is open and uncovered space; and

(d) in determining yard encroachments, s. 5.15.1 provides a yard shall be open and unobstructed by any building or structure from the ground to the sky;

therefore, if the garage was a detached accessory building, the municipality can ignore the sub-surface corridor for setback purposes and the detached garage built one metre from the rear lot line conforms with by-law requirements.

[para28] Mr. Barnes, the municipality's Planner, in his cross-examination agreed the by-law has regard to sub-surface structures for the purposes of its use provisions but does not take sub-surface structures into account for the purposes of the yard setback and coverage provisions.

[para29] However, this two-stage approach ignores that in stage one, in having to convince the court there is only one structure or building containing a dwelling with a home occupation, the result is there no longer exists a detached garage or accessory building. Under s. 3.56 of the by-law a private garage can mean "a separate building or a part of the principal building used for the parking or storage of vehicles." As of the date of the permit application, this garage use was permitted because the garage was part of the principal or only building on this lot.

[para30] Section 3.15.1 in defining a rear yard provides it "shall mean the yard extending across the full width of the lot between the rear lot line of the lot and the nearest part of any principal building or structure on the lot." Under the stage one approach there is only one structure. Even if the garage could be considered an accessory building, it is attached to the main building and s. 5.27.3 provides in that

case, that yard requirements shall be complied with as if the accessory building was part of the main building. In s. 7.3.1.4, the minimum rear yard requirement is eight metres for a single family dwelling, rather than the one metre found in s. 7.3.3.1 for accessory buildings not attached to the principal building.

Decision

[para31] I find that there is only one structure or building on this lot, and declare that Mr. Putnam's office space in the former garage is a conforming use, being a home occupation in a dwelling. Further, the by-law is not ambiguous.

[para32] Under normal conditions, the court would find the building, being a dwelling whose rear wall is located one metre from the rear lot line, does not satisfy the rear lot eight metre setback requirement of the by-law.

[para33] However, the municipality reviewed the application for the building permit and the construction plans and determined there were two structures, a dwelling house and a detached garage. It granted the building permit. The municipality now argues that Mr. Putnam never disclosed it was his intention to use the garage space as a home office. With respect, that use is not the issue here. The problem was granting the permit when the plans disclose only one building, the rear limit of which was to be built one metre, not eight metres, from the rear lot lines, contrary to the by-law.

[para34] The municipality initially interpreted the zoning by-law while in possession of plans showing the location of the structure on the lot. It is now estopped from enforcing the eight metre rear setback against the applicant.

[para35] The relief requested in the respondent's application is dismissed.

[para36] In the event the parties cannot agree on costs, I am prepared to hear submissions for that purpose on a date to be established by the trial co-ordinator.

BELCH J.

R. Pickles

COURT OF APPEAL FOR ONTARIO

DOHERTY, MACPHERSON and SIMMONS JJ.A.

BETWEEN:

HER MAJESTY THE QUEEN ***Appellant***

- and -

DARCY PICKLES ***Respondent***

Michael M. Miller for the appellant
Eric O. Gionet for the respondent

HEARD: January 8, 2004

On appeal from the judgment of Justice Joseph B. Wilson of the Ontario Court of Justice dated April 23, 2003.

MACPHERSON J.A.:

A. INTRODUCTION

[1] The respondent, Darcy Pickles, constructed a dock for the Ravalli family in the township of Seguin. He did not obtain a building permit from the township and was charged with the offence of building without a permit contrary to s. 8(1) of the Building Code Act, 1992, S.O. 1992, c. 23 ("the BCA"). Section 36(8) of the BCA establishes a one year limitation period for certain offences, including violations of s. 8(1). The information charging Pickles was sworn thirteen months after the completion of the dock.

[2] His Worship Justice of the Peace Michael G. Kitlar dismissed the charge on the basis of the limitation period. His decision was upheld on appeal by Justice Joseph B. Wilson of the Ontario Court of Justice. Morden J.A. of this court granted the Crown leave to appeal Wilson J.'s decision and framed the legal questions as follows: "Does the doctrine of discoverability apply to the offence of constructing without a permit and is this offence a continuing offence?"

B. FACTS

(1) The parties and the events

[3] Darcy Pickles was a building contractor. Sab Ravalli owned a cottage in the township of Seguin. He retained Pickles to build a boathouse. Pickles went to the township's building department and was told that he would need to obtain approval from the Department of Fisheries and Oceans ("DFO") in order to build a boathouse on the Ravalli property.

[4] Pickles and Ravalli met Andrea Doherty, a DFO representative, at the cottage. She told them that it would be difficult to obtain approval for a boathouse. However, Doherty told them that they could build a floating dock instead and advised them where they could build it. Ravalli testified that Doherty told them that she would send them a confirming letter within a week. She did not send such a letter. Pickles and Ravalli constructed the dock in July 2000. Pickles did not return to the township's building department to seek a building permit because he thought that DFO's verbal approval through Doherty was sufficient.

[5] In August 2001, the municipal authorities became aware of the Ravallis' floating dock. Pickles was charged with building without a permit contrary to s. 8(1) of the BCA:

> 8(1) No person shall construct…a building…unless a permit has been issued therefor by a building official.

(2) The court proceedings

[6] The trial took place before His Worship Justice of the Peace Kitlar.

[7] The BCA creates three types of offences:

> 36(1) A person is guilty of an offence if the person,
>
> (a) knowingly furnishes false information in any application under this Act or in any statement or return required to be furnished under this Act or the regulations;

> (b) fails to comply with an order, direction or other requirement made under this Act; or
>
> (c) contravenes this Act, the regulations, a bylaw passed under section 7 or a condition imposed under section 9.

The offence of building without a permit contrary to s. 8(1) comes within s. 36(1)(c) of the BCA.

[8] The BCA also contains a limitation period for s. 36 offences:

> 36(8) No proceeding under this section shall be commenced more than one year after the time when the subject?matter of the proceeding arose.

[9] The trial judge held that this limitation period compelled the acquittal of Pickles since the Crown had laid the charge against him thirteen months after the dock had been constructed. The appeal to Justice Wilson was dismissed. The Crown sought and obtained leave to appeal to this court.

C. ISSUES

[10] The issues on appeal are the two set out in Justice Morden's order granting leave to appeal: Does the doctrine of discoverability apply to the offence of constructing without a permit and is this offence a continuing offence?

D. ANALYSIS

[11] The Crown contends that the courts below made two errors: (1) they did not apply the discoverability principle to the limitation period set out in s. 36(8) of the BCA and (2) they did not hold that the offence of building without a permit contrary to s. 8(1) of the BCA is a continuing offence which becomes complete only when a permit is obtained. I will deal with these two submissions in turn.

(1) Discoverability

[12] Pickles completed construction of the dock in July 2000. The township first became aware of the dock in August 2001. Pickles was charged with building without a permit the same month. The Crown contends that it was the township's 'discovery' that Pickles had built a dock without a permit that triggered the commencement of the s. 36(8) limitation clock. Accordingly, the charge was laid mere days - not thirteen months - after the clock started to run.

[13] The discoverability rule is merely a rule of construction. It will apply to some limitation periods, but not to all. This fundamental point, as well as the test for distinguishing between application and non?application scenarios, were explained by Major J. in the leading case Peixeiro v. Haberman, [1997] 3 S.C.R. 549 at 564:

> In this regard, I adopt Twaddle J.A.'s statement in Fehr v. Jacob (1993), 14 C.C.L.T. (2d) 200 (Man. C.A.), at p. 206, that the discoverability rule is an interpretive tool for the construing of limitation statutes which ought to be considered each time a limitations provision is in issue:
>
> > In my opinion, the judge?made discoverability rule is nothing more than a rule of construction. Whenever a statute requires an action to be commenced within a specified time from the happening of a specific event, the statutory language must be construed. When time runs from "the accrual of the cause of action" or from some other event which can be construed as occurring only when the injured party has knowledge of the injury sustained, the judge?made discoverability rule applies. But, when time runs from an event which clearly occurs without regard to the injured party's knowledge, the judge?made discoverability rule may not extend the period the legislature has prescribed.

See also: Waschkowski v. Hopkinson Estate (2000), 47 O.R. (3d) 370 (C.A.).

[14] In his text Guide to Ontario Building Legislation (Carswell: Scarborough, 1996), Richard Arblaster discusses the limitation period set out in s. 36(8) of the BCA. He said, at p. 1-56:

> The offence of breaching the Building Code Act or its regulations or by-laws occurs when the offence is committed, as opposed to when discovered, and is also concluded on the day that the activity is question is completed. For example, the offence of building without a permit would be concluded on the last day that work without a permit occurred; building not in conformance with the Building Code would be concluded on the day that the building or construction in question was completed or work ceased. The one-year limitation period would begin to run from that day.

[15] I agree with this analysis and conclusion. The event which led to the charge against Pickles (or, in the language of s. 36(8) of the BCA, "the subject matter of the proceeding") was building the dock without a permit. This specific act was completed in July 2000. It was, therefore, the completion of this act that triggered the commencement of the limitation period. There is nothing in the nature of this specific act or in the wording of s. 36(8) of the BCA to suggest that the limitation period commenced at the moment the township 'discovered' Pickles' act. Accordingly, the laying of the charge against him thirteen months after he had completed construction of the dock was outside the one year period set out in s. 36(8).

[16] Moreover, I note that, in the context of regulatory statutes like the BCA, it is open to the legislature to specifically build the discoverability principle into the wording of a limitation period. An example is s. 129(1) of the Securities Act, R.S.O. 1990, c. S.5:

> 129(1) No proceeding under this Part shall be commenced in a court more than one year after the facts upon which the proceeding is based first came to the knowledge of the Commission.

In the absence of clear legislative language importing the discoverability principle into a statute, I see no reason why the court should expand the reach of the regulatory prohibition by resort to the discoverability principle.

(2) Continuing offence

[17] The Crown's second submission is that the offence of building without a permit is a continuing offence until a permit is obtained. Since Pickles never obtained a permit, the limitation period did not begin to run before he was charged. In support of this submission, the appellant relies on the decision of Justice Hawke in R. v. Aregers (1997), 38 C.L.R. (2d) 95 (O.C.J.) ("Aregers"), wherein she held that the offence of building without a permit in s. 8(1) of the BCA was not complete until a permit had been issued.

[18] I do not agree with the decision in Aregers. I note that leave was sought to appeal it to this court: Shanks v. Aregers (1997), 38 C.L.R. (2d) 101. Charron J.A. refused to grant leave because it was not essential in the public interest or for the due administration of justice that leave be granted: see Provincial Offences Act, R.S.O. 1990, c. P.33, s. 131(2). However, Charron J.A. observed, at para. 7, that she found "much merit in the position advanced by the applicant, particularly with respect to the interpretation given by the appeal court judge [Justice Hawke] to s. 8(1)."

[19] In the present case, Wilson J. also declined to follow Aregers. He said:

> With respect, I am not of the same view as Justice Hawke in the Aregers case where she stated that the subject matter "is the presence of construction and the issuance of a permit."….In my opinion, the illegality of Mr. Pickles' actions ended when he finished the project before the end of July 2000 and did not continue thereafter. There was nothing further for him to do [emphasis in original].

[20] In reaching this conclusion, Wilson J. relied on the decision of this court in R. v. Rutherford (1990), 38 O.A.C. 41 ("Rutherford"). In that case, an electrical contractor was charged with faulty installation of electrical equipment contrary to s. 93(11)(b) of the Power Corporation Act, R.S.O. 1980, c. 384. The charge was laid more than six months after the installation work had been completed. By virtue of s. 76(1) of the Provincial Offences Act, R.S.O. 1980, c. 400, a six month limitation period applied to the offence.

[21] The Crown took the position that because the faulty installation had never been repaired, the offence was a continuing one and the limitation period did not apply. A majority of the court (Morden and Grange JJ.A.) rejected this submission. Grange J.A. stated, at pp. 43 and 44:

> It is important that we appreciate just exactly what it was that the appellant did that brought about the charges. He installed an improper panelboard and provided improper grounding on the service switch at premises located at Lot 35, Concession 5, Darlington Township. All of the work was performed and completed by August 23, 1985.
>
> . . . . .
>
> It is contended by the prosecution that so long as the defect continues, these offences continue and time does not therefore run.
>
> I cannot accept that contention. The act complained of, in my view, was faulty installation under s. 93(11)(b) of the Power Corporation Act and all of that work was completed on August 23, 1985. The appellant's neglect to comply with the regulation was complete on that date and time under the limitation section of the Provincial Offences Act then started to run.

[22] In my view, Wilson J. was correct to rely on Rutherford in the present case. The nature of the offences in the two cases is similar. In both cases, there was a specific act - faulty installation of electrical equipment and construction of a dock without a building permit. In both cases, the consequences of the specific act 'continued' in a sense - the electrical equipment was not repaired and a building permit was never obtained. However, in Rutherford this court held that the completion of the specific act triggered the commencement of the limitation period. As Wilson J. correctly recognized, the same interpretation, and result, should follow in the present case.

[23] There is a second feature of Rutherford that, in my view, is telling in this appeal. In his discussion about so-called 'continuing offences', Grange J.A. observed, at p. 45:

> It is considerably easier to find a continuing offence where the statute provides for a penalty for every day that the corrective work is not done or the offending activity continues to be done. Such a provision is found in s. 93(11)(c) of the Act, which relates to continued disobedience of an order made under s. 93(5). The juxtaposition of this provision in s. 93(11)(c) to the absence of such a provision in s. 93(11)(b) is significant.

[24] There is a similar juxtaposition of provisions in the BCA. Indeed, under the specific heading Continuing offence, s. 36(6) of the BCA provides:

> 36(6) Every person who fails to comply with an order made by a chief building official under subsection 14(1) or clause 15(5)(a) is guilty of an offence and on conviction, in addition to the penalties mentioned in subsections (3) and (4), is liable to a fine of not more than $10,000 per day for every day the offence continues after the time given for complying with the order has expired.

[25] In my view, it is clear and noteworthy that the legislature specifically addressed the subject of continuing offences in the BCA, and did not include violations of s. 8(1) in its list of such offences.

E. DISPOSITION

[26] I would dismiss the appeal.

RELEASED: February 24, 2004 ("DHD")

	)	**HEARD:** December 16, 2003

Weekes J.,

Background

[1] For approximately one hundred and twelve years the Sharon Social Fishing Club (the Club) has owned and used land on Tondern Island in Lake Muskoka. At present, there is a residential building which has twenty-six beds situated on the property.

[2] Lloyd Ross owns a neighbouring property. Pursuant to s. 25 (1) of the *Building Code Act*[1] he appeals the decision of the Chief Building Official for the Township of Muskoka Lakes (Mr. Donald) to issue a building permit to the Club for a proposed addition to the building in question. At the same time, he seeks an Order quashing the issuance of the building permit on the basis that it was issued before the execution and registration of a Site Plan Agreement, with the result, it is contended, that the issuance was contrary to "other applicable law" and in violation of s. 8 (2) of the *Building Code Act*. Finally, Mr. Ross seeks an Order quashing two resolutions of the Municipal Council (Council) on the basis that the process adopted by Council that lead to the passing of the resolutions was contrary to the *Municipal Act*[2], the procedural by-law of the Township and the principles of natural justice.

[3] Before considering the substantive issues raised by counsel for Mr. Ross it is necessary to address the standard of review to be employed in reviewing the decision of Mr. Donald to issue the building permit.

Standard of Review

[4] The issue of the appropriate standard of review of the decision of a Chief Building Official was considered by Justice Howden in *Rotstein v. Oro-Medonte (Township)* 34 M.P.L.R. (3d) 266 (Ont. S.C.J.). I accept Justice Howden's decision on the issue to be an accurate summation of the law. In his decision he made reference, with approval, to the decision in *Runnymede Development Corp. v. 1201262 Ontario Inc.* (2000), 47 O.R. (3d) 374 (Ont. S.C.J.) where, at para. 29, Justice Molloy wrote:

It is not possible to say where on the continuum between patently unreasonable and correct the appropriate standard will fall for all cases involving a Chief Building Official, as the level of deference to be accorded will vary depending on the nature of the issue before the tribunal. Indeed, the apparent differences applied by the various decisions of this court to date can largely be explained by the differences in the nature of the question being determined. The more the Chief Building Official's decision is a determination of law, the closer the standard will be to correctness. The more the initial decisions depended upon factual determinations within the special expertise of the Chief Building Official, the more deferential will be the standard.

[5] In *Rotstein*, Justice Howden spoke of the varying standard of review. He observed, at para. 16:

This variable standard of review in the case of the Chief Building Official is probably unavoidable in view of the statutory parameters within which that

official is bound to act in making a permit decision under section 8. Those include: his observations of structures and condition at the lot under review, the provisions of the *Building Code Act* and the highly technical Code itself, and "any other applicable law". As to the *Building Code Act*, CBO's receive training and use it to a limited extent but they are far from being trained in law or statutory interpretation. On the other hand, in dealing with the Building Code, they are acting close to the core of their specialized knowledge and experience. As to "other applicable law", that term may encompass the local zoning by-law or a law external to the work and training of the CBO. In the latter case, the CBO may seek advice from other municipal officials such as the municipal planner or the municipality's lawyer. In the case of the zoning by-law, depending on the nature of the particular issue, the CBO may well bring valuable experience particularly where the issue focuses on the structural observations and conclusions.

[6] The evidence before me in this case is that Mr. Donald has limited personal knowledge of the use made of the property by the Club. He has been on the property only once in the twenty years that he has been employed by the Township, although, in fairness, he also said that he had been on the abutting Ross property several times within the last three or four years and had observed the Club's property from that vantage point.

[7] Mr. Donald was cross-examined on his affidavit in which he stated that he had recommended the particular zoning, OS3, for this property when the Township was developing its comprehensive zoning by-law. The following exchange occurred on this issue at questions 84 and 85:

84 Q. All right. What then - At the time you made the recommendation, what was the basis upon which you had any understanding of the uses that were being made of that property?

A. Historical conversation with Kaye Brothers, abutting owners, my own person observations driving by, knowing the charter boat driver. Various things like that as to what went on on the property.

85 Q. To be clear though, you never spoke to any club officials or club members?

A. No.

[8] In my view, the critical issue in this case is whether the use made by the Club of its building is accessory to the principal use of the property. In making that assessment I am as well positioned as Mr. Donald, given his limited knowledge of the property. In these circumstances the appropriate standard of review is correctness.

The Applicable Zoning

[9] Much of the argument before me was devoted to the issue of whether the lands had been appropriately zoned by by-law 87-87. There is insufficient evidence upon which to conclude that the lands were wrongly zoned sixteen years ago. Obviously, the use might have changed in the intervening years. That possibility is raised by comments in a letter dated October 8, 2002 from William E. Casey, President of the Club, to the Planning Committee. If the use has not changed, for reasons that will become apparent, the wrong zoning was imposed. The determination of the use to which the property was put sixteen years ago will have to wait until another day. The issue for today is whether, at the time of the issuance of the building permit, the use of the building was an accessory use to the main use of the property.

[10] By-law 87-87 zones the property commercial open space (OS3). A private club is permitted in that zone. "Private club" is defined in the by-law as follows:

PRIVATE CLUB: means a golf, tennis, sailing, or other athletic, social or recreational club located on private lands.

[11] The OS3 zone specifically permits a residential use accessory to the other permitted uses of the property. Counsel for Mr. Ross submitted that such a use should be limited to bedrooms for the staff of the Club. I do not think there is any reason to limit the interpretation of the by-law in that fashion. However, the real question is whether the residential use is indeed accessory to the other permitted uses.

[12] "Accessory" is defined in the by-law as follows:

ACCESSORY: when used to describe a USE, BUILDING or STRUCTURE means a USE, BUILDING or STRUCTURE subordinate,

incidental and exclusively devoted to the main USE, BUILDING or STRUCTURE located on the same LOT.

[13] To answer the question of whether the use of the building is accessory to the main use, it is necessary to determine the main use. In that regard, there is no information directly on point from the Club. Mr. Donald characterized the use of the property as being that of a private club with members who fished and engaged in recreational activities on the water. It was Mr. Donald's evidence that the main building on the property, which is the subject of the proposed addition, contains cooking, dining and sleeping facilities and an area he described as being a "recreating area" which I take to be a space for people to congregate and socialize. Mr. Fahner, the Township Planner, also characterized the use of the property as being that of a club with accommodation, the members engaging in fishing and boating.

[14] Mr. Donald was asked how it was that he determined that the use of the building was accessory to the use of the property at Q. 132 and 133:

132 Q. All right. Yet you've made a determination that the use of the lodge is an accessory dwelling unit to the use of the building - to the use of the property, excuse me?

A. Yes, to the use of the property.

133 Q. And again, I ask you to advise me how that is considered subordinate to and incidental to the uses that are being put on that property?

A. Basically, the whole property is - is permitting the use of a club. Its ordinary dwelling units, their lot coverage is ten percent and Mr. Ross' property - the abutting property, this here zoning permits five percent lot coverage, which we're well under, and it's devoted to the main use of the property and that's how I interpreted it.

[15] It would appear from this answer that Mr. Donald determined the residential building to be an accessory use because the lot coverage was well under the five percent limit set by the by-law. That approach has nothing to do with an assessment of the main use of the property and a determination as to whether the residential use of the building is subordinate, incidental and exclusively devoted to the main use.

[16] In October 1999 the Club retained an architect to prepare drawings for the proposed addition which is now the subject of this dispute. In the letter by which the Club retained the architect Charles G. Cricks, president of the Club at the time, wrote, in part, as follows:

Our addition plans conform to all existing zoning regulations and all sewage system requirements have been addressed and met. As regard to the National Building Code and Use Group Classifications, please understand that this is a residential facility owned by the Sharon Social Fishing Club of Sharon, Pennsylvania. This club conducts all its business and holds all its meetings in Sharon, Penna, in accordance with its by-laws. No business is conducted at its Canadian cottage, nor are there any meetings held there. The purpose of the facility on Tondern Island is simply for the enjoyment of the members, their families and guests as a vacation cottage for activities such as fishing, swimming, boating, etc. Again, all activities conducted at this facility are of a residential nature and (sic) is a privately owned co-operative existing for the aforementioned purpose.

[17] The approach taken by the Township as to the use of the property confuses use with ownership. The property is owned by the Club. Its use is as a communally owned cottage, not a club. That was made clear by Mr. Cricks in his letter to the architect which I consider to be the best evidence of the use of the property at October 31, 2002, being the date the building permit was issued.

[18] In the absence of evidence to the contrary, I conclude that, as is common with the vast majority of vacation cottages, the use of the property, while important, is incidental to the use of the building itself. At least it would ordinarily be no more important than the use of the residential building. In my view, the main use of the property is as a vacation cottage. The fact that activities, such as swimming, take place on the property does not make the use of the residential building subordinate and incidental.

[19] I conclude that the decision of Mr. Donald to issue the building permit on the basis that the dwelling unit was an accessory use was an error. The building permit should not have issued because the uses associated with

the occupation of the residential building (as a cottage) are, in fact, the main use of the property.

Site Plan Approval as Other Applicable Law

[20] The Township is subject to site plan control. The proposed development requires a Site Plan Agreement. In broad terms section 41 (4) of the *Planning Act*[3]provides that no development shall occur until Council of the municipality or the Ontario Municipal Board approves the Site Plan Application in connection with the development.

[21] The Club submitted its application for a building permit on September 9th. On the same day the Township Planner wrote to advise that Site Plan Approval was required. Mr. Donald advised the Club's contractor that a building permit would not be issued while the Site Plan Application was being considered by the municipality. Mr. Donald's evidence is that he took this position because, until the site plan approval was granted or refused, he considered himself bound by s. 8 (2) of the *Building Code Act* which provides as follows:

8 (2) The chief building official shall issue a permit under subsection 1 unless,

(a) the proposed building, construction or demolition will contravene this Act or the building code or any other applicable law;

Mr. Donald testified that his understanding of this section was that site plan approval fell into the category of "other applicable law".

[22] It was also Mr. Donald's understanding that if Council refused to approve the Site Plan Application the requirement for site plan approval prior to the issuance of the building permit ceased and the proposed construction no longer contravened any other applicable law.

[23] Mr. Donald made this position known to Council on October 30th. On that date Council gave conditional approval to the Site Plan Application. The building permit was issued the next day. The Site Plan Agreement was registered approximately three months later.

[24] It is contended on behalf of Mr. Ross that the building permit ought to be rescinded because it was issued prior to execution and registration of the Site Plan Agreement. Thus, it is argued, at the time of issuance of the building permit the construction would contravene "any other applicable law".

[25] In *Quay West v. Toronto (City)*[4] Southey J., writing for the court on this issue, stated at p. 111-112:

In any event, I am not satisfied that the chief building official was under a duty to issue the permit as matters stood in August 1988, because there had been no site plan approval at that time. As a general rule, a building permit should not be issued for a development in a site plan control area to which s. 40 of the *Planning Act* applies until site plan approval for the development has been obtained from council or the Municipal Board. Without such approval, the proposed building would contravene s. 40 (4) of the *Planning Act*, and the permit should not be issued because of s. 6 (1)(a) of the *Building Code Act*. ...

[26] Justice Southey went on to point out that in two cases it was held that a building permit should issue despite the lack of site plan approval[5]. He observed that "both arose from extraordinary circumstances in which the municipality was not acting in good faith or was refusing developmental approval for an obviously unlawful reason. He did not consider the case before him to be "one of those extraordinary cases in which the building permit should have been issued despite the absence of site plan approval".

[27] To the cases referred to by Justice Southey can be added the decision of Rosenberg J. in *Luxor Entertainment v. North York (City)*[6]. *Luxor* is another example of a court ordering the issuance of a building permit without site plan approval because of the existence of extraordinary circumstances.

[28] In *Sixteenth Warden Ltd. v. Markham (Town) Chief Building Official**[7]*** Justice Day ordered the issuance of a building permit in the face of bad faith on the part of the Town of Markham. After referring to *Revenue Properties* he made the following observation at para. 48:

It has been argued that this decision should be limited in application to extraordinary circumstances in which the municipality was not acting in good faith or was refusing developmental approval for an obviously unlawful reason. The issue is one of statutory interpretation and construction, and I see no reason to limit its application to extraordinary circumstances. I therefore find that the proposed construction in the circumstances of this case would not contravene "any other applicable law," as those words are used in s. 6(1)(a) of the *Building Code Act*, solely because site plan approval had not yet been given.

On the strength of this passage the Township argues that there is a rule of law that a building permit can be issued before site plan approval and that it is not necessary for extraordinary circumstances to exist before that occurs.

[29] I do not share the view of Justice Day. I consider the decision in *Quay West* to be binding. The general rule is that site plan approval is required before the building permit is to be issued because site plan approval is "other applicable law". It does not cease to be "other applicable law" because Council refuses to approve it. S. 41 (12) of the *Planning Act* contains a provision for appeal to the Municipal Board. In the absence of bad faith or other unlawful conduct on the part of the municipality, there should be no reason for departing from the general rule. Where a municipal council refuses site plan approval the issuance of the building permit should await the decision of the Municipal Board. This gives effect to the statutory regime established by the Legislature. Only where there is bad faith or other unlawful conduct should the court exercise the jurisdiction given to it under the *Building Code Act* to rectify an injustice by granting a building permit in the absence of site plan approval.

[30] In the present case there is no evidence of bad faith or unlawful conduct on the part of the Council. The refusal to approve the site plan following the delegations is equally consistent with a concern that the proposed addition was contrary to the zoning. Absent bad faith or other unlawful conduct, Mr. Donald should have refused to issue the building permit and awaited the decision of the Municipal Board.

[31] Assuming (but without deciding) that site plan approval means execution of a Site Plan Agreement and registration of it, I would not rescind the building permit on the basis that it was issued prior to site plan approval. This would result in a triumph of form over substance which is in no one's interest. All that would occur in such event is that the Club would apply for a fresh building permit.

Reconsideration by Council

[32] The Planning Committee heard deputations on behalf of Mr. Ross and the Club on October 9th. The Planning Committee then refused the application for the site plan approval.

[33] The matter was considered by Council on October 28th. Deputations on behalf of Mr. Ross and the Club were entertained at that meeting following which Council upheld the decision to refuse site plan approval.

[34] On October 29th Mr. Roche, counsel for the Club, wrote to the building department to inquire as to whether it would issue a building permit, demanding a reply by November 1st.

[35] On October 30th Council reconvened as Planning Council in a closed session to discuss the matter. Council then reconvened as Council in an open session, rescinded the decision of the Planning Committee of October 9th, as approved on October 28th, and conditionally approved the Site Plan Application submitted by the Club.

[36] On behalf of Mr. Ross two complaints are raised regarding this procedure. First, it is said that Council, sitting as Planning Council, had no right to discuss the matter in a closed session. Second, it is contended that before making a decision Council was obliged to give Mr. Ross the opportunity to make further submissions on the issue.

[37] It is conceded by counsel for Mr. Ross that the Planning Act does not require the holding of a formal public meeting as part of the processing and consideration of a Site Plan Application. It is contended that, however, that once Council extended, as a courtesy, an offer to Mr. Ross to comment on the Site Plan Application, Council was obliged to continue the process of site plan approval as if Mr. Ross had a legal right to comment. It is contended that this was required as a matter of fairness.

[38] The resolution indicated Council was reconvening in a closed session to discuss a legal matter. Pursuant to s. 55 (5)(e) of the *Municipal Act*, Council was entitled to go into a closed session to discuss potential litigation. Given the deputations that had been entertained, it was entirely reasonable for Council to believe that the issue before it could potentially be litigious. It is too narrow an interpretation of s. 55 (5)(e) to say that because no legal or privileged advice was received in the closed session Council had no right to go into a closed session. There will be occasions when Council will want to take stock of an issue which could blossom into a lawsuit without the municipal lawyer being present or having given legal advice. In this instance there was a very real prospect that the Chief Building Official would be sued. Although he has an independent function he is, nonetheless, an employee of the Township for which Council is ultimately accountable. Moreover, his position was at odds with that taken by Council on the issue of whether the proposed development should proceed. To consider these issues, Council was justified in closing the meeting in which it reconsidered its decision of October 28th.

[39] It is not necessary to determine whether, by extending a courtesy to comment, Council was obliged to continue the process as if there were a legal right to comment and to a fair hearing. The letter written by Mr. Roche did nothing more than request the issuance of the building permit and an answer by November 1st. The letter did not raise new arguments that, in fairness, might have justified Council offering a further opportunity to Mr. Ross to make comment. In the present situation, all that could have happened was a reiteration of the position already taken on behalf of Mr. Ross. That would be a time wasting exercise. Council committed no error in not offering Mr. Ross a further opportunity to address it on the merit of reversing its earlier decision. Nothing in the procedural by-law compels a contrary conclusion.

Conclusion

[40] It is clear from the evidence of Mr. Donald that the only reason that Council approved the Site Plan Application was because Mr. Donald indicated to Council that he was going to issue the building permit despite Council's refusal to approve the Site Plan Application. As the building permit should not have been issued the Site Plan Approval should be rescinded.

[41] For the reasons given there will be an Order as follows:

i) Rescinding the building permit issued to the Club on October 31, 2002.

ii) Rescinding the site plan approval granted on October 30, 2002.

[42] If the parties are unable to agree on the issue of costs, counsel may speak to the matter by way of a conference call to be arranged through the Trial Co-ordinator in Barrie.

Released: January 5, 2004

723 Rymal Inc. v. Hamilton (City) Chief Building Official

Between
723 Rymal Inc., applicant, and
Peter Lampman, in his capacity as Chief Building Official of The Corporation of the City of Hamilton, and The Corporation of the City of Hamilton, respondent

[2001] O.J. No. 832
Court File No. 00-2262

Ontario Superior Court of Justice
Lofchik J.

Heard: January 4, 2001.
Judgment: January 9, 2001.

Counsel:

Russell D. Cheeseman, for the applicant.
Nancy L. Smith, for the respondent.

¶ 1 **LOFCHIK J.**:— The applicant is the owner of premises known municipally as 723 Rymal Road, in the City of Hamilton and seeks an order requiring the respondent, Peter Lampman, in his capacity as Chief Building Official of The Corporation of the City of Hamilton, to issue a demolition permit in respect of a vacant brick house located on the said lands. The vacant brick house in question is known as "Gage House" and at the time of application for demolition permit was approximately 150 years old and included on the City's inventory list as being of heritage/historical interest to the city.

¶ 2 In May of 1998 the applicant applied to the City of Hamilton for an Official Plan Amendment and a Zoning By-law Amendment in relation to the lands located at 723 Rymal Road. The applicant's original proposed development was for a "community & residential care access centre" and the proposed development did not include the vacant brick house on the property known as "Gage House" which, because of its age may be referred to as a "heritage property".

¶ 3 In October of 1998 the applicant changed its proposed development to include the community and residential access care centre and Gage House.

¶ 4 As a result of application made by the applicant, The Corporation of the City of Hamilton adopted Official Plan Amendment No. 158, which provided for a proposed development including the community and residential care access centre and a restaurant within Gage House.

¶ 5 The amendment to the City of Hamilton Official Plan stated that the purpose of the amendment was as follows:

> The purpose of this amendment is to establish a `special policy area' within the `residential' designation to permit a community and residential care access centre, including limited associated commercial uses, on the subject property.

¶ 6 The basis for the amendment was set out as follows:

> The basis for permitting the community and residential access care centre, including limited associated commercial uses, within the `residential' area are as follows:
>
> 1. The subject lands are located on a major arterial road, at the periphery of the neighbourhood.
> 2. The community and residential care access centre would provide residential short term care facilities and medical services including patient care, assessment and uptake, to the communities of the Hamilton West Mountain, Ancaster, and Glanbrook.
> 3. The proposal includes the adaptive reuse of a heritage dwelling upon the subject lands as a component of the development.

¶ 7 The amendment to the Official Plan of the City of Hamilton provided as follows:

> Notwithstanding the permitted uses set out in Subsection A.2.1

- Residential Uses, for the front portion of the lands known municipally as 723 Rymal Road West, shown on Schedule "B" as SPECIAL POLICY AREA 81, a community residential care access centre including limited associated commercial uses will also be permitted provided that:

i) The commercial uses will be restricted to:

a) A restaurant within the existing heritage dwelling only. There will be no drive through component and the restaurant will not consist entirely of a take out.
b) Medical related commercial and Medical offices, within the community and residential care access centre, having a maximum floor area of 1350m2.

ii) The external appearance and character of the existing heritage dwelling will be maintained.

¶ 8 On April 27th, 1999, the City of Hamilton passed Zoning By-law 99-058 being a site-specific zoning by-law applicable to the lands in question, hereinafter referred to as "the rezoning by-law". The provision of the Re-zoning By-law relevant to the proceedings before me are as follows:

(a) notwithstanding Section 10C.(1) of Zoning By-law No. 6593, only the following uses shall be permitted:

(i) a "Community and Residential Care Access Centre"; and,
(ii) a restaurant provided that,

1. it is located within the dwelling or any portion existing on the day of the passing of the by-law; and,
2. the external appearance and character of the dwelling shall be preserved and maintained; and,
3. a drive-thru or take-out shall not be permitted; and,
4. it is only accessory to and used in conjunction with the "Community and Residential Care Access Centre"; and,

¶ 9 The lands which are the subject matter of this application are designated by City of Hamilton By-law No. 79-275 as an area of site plan control. On May 4th, 1999 an application was received from the applicant for site plan approval in relation to the lands. The City approved the site plan application on December 7th, 1999. The proposed development contained in the site plan submitted and approved by the City of Hamilton includes the Community and Residential Care Centre and the Gage House Restaurant. One of the conditions in the site plan approval required the applicant to undertake certain measures related to the preservation and maintenance of the Gage House building.

¶ 10 Subsequently the applicant entered into a site plan agreement with the City of Hamilton which was registered on title to the property.

¶ 11 On March 6th, 2000, the Building Commissioner for the City of Hamilton issued a building permit for the Community and Residential Care Access portion of the development on the lands and that applicant has proceeded with construction of the said community and residential care access centre which is in the final stages of completion.

¶ 12 On August 29th, 2000, the applicant applied to the City of Hamilton for a demolition permit for Gage House. To date no demolition permit has issued and the applicant has therefore brought this application to compel issuance of a demolition permit.

¶ 13 On November 3rd, 2000, the applicant applied for an amendment to its site plan approval. The proposed development for the lands is the same as that already approved except that the new proposal eliminates the Gage House restaurant.

¶ 14 As approval to the revised plans and drawings was not forthcoming, the applicant has appealed the City of Hamilton's failure to approve such plans and drawings to the Ontario Municipal Board. This appeal is still outstanding.

THE LAW

¶ 15 A chief building official must issue a demolition permit under the Building Code Act unless the demolition will contravene, among other things, "applicable law". "Applicable law" is defined as "any general or special Act and all regulations and by-laws enacted thereunder which

prohibit the proposed construction or demolition of the building unless the Act, Regulation, or by-law is complied with." (see Building Code Act)(1992), S.A. 1992, C-23 as amended, s. 8(2) and Ontario Regulation 403/97, s. 1.1.3.2(1).

¶ 16 Accordingly the issue to be determined is whether the demolition of "Gage House" would contravene "applicable law" in the circumstances of this case.

¶ 17 Counsel on behalf of the City of Hamilton has argued that the relevant "applicable law" is section 41 of The Planning Act and Zoning By-law 99-058.

¶ 18 In interpreting planning statutes and by-laws, the courts have generally adopted a liberal approach. In the case of Bruce v. Toronto (City), [1971] 3 O.R. 62, the Ontario Court of Appeal at p. 66 stated as follows:

> ..... I consider the [zoning] by-law to be remedial and one to be accorded a liberal interpretation to the end that it may afford to the people of the community, protection against departures from or encroachment upon standards adopted by the municipality as expressive of those purposes ..... Ontario Courts now accept that the obligation imposed on the municipal council to plan for the growth and development of the community demands recognition of the necessity for means to compel the observance of the rights of the community to determine and enforce the direction in which the community should be shaped, and that in this regard the rights of the community are paramount to the rights of the owner.

(see also Galway & Cavendish (United Townships) v. Windover (1995) 30 M.P.L.R. (2d) 109 @ 122 and Woodglen & Co. v. North York (City) Chief Building Official (1994) 23 M.P.L.R. (2d) 219 at pp. 226-27)

¶ 19 As the applicant has obtained site plan approval for the development pursuant to s. 41 of the Planning Act, it is subject to s. 41(4) of that Act, which provides as follows:

> No person shall undertake any development in an area designated under subsection (2) unless the council of the municipality or (where a referral has been made under subsection 12), the Municipal Board has approved one or both, as the council may determine of the following:
>
> 1. plans showing the location of all buildings and structures to be erected and showing the location of all facilities and works to be provided in conjunction therewith and of all facilities and works required under clause 7(a) .....

¶ 20 The Planning Act is "applicable law". The applicant has undertaken development of the site in accordance with approved plans submitted pursuant to s. 41(4) of the Planning Act. Part of the approved development is near completion but the other part of the approved development, namely the restoration of Gage House, is not. The demolition of Gage House will prevent the applicant from completing its development in accordance with the site plan which has been approved and the site plan agreement entered into with the City of Hamilton and put the applicant in contravention of section 41 of the Planning Act.

¶ 21 Zoning By-laws are "applicable law". For the purposes of determining compliance with the applicable law, zoning by-laws must be interpreted in the context of the applicable Official Plan provisions. (see Loblaws Inc. v. Ancaster (Town) Chief Building Official (1992) 13 M.P.L.R. (2d) 73 @ 85 and Doublerink Arenas Ltd. v. North York (City) Chief Building Official, (1996) 33 M.P.L.R. (2d) 158 at 162; Campeau Corporation v. Township of Gloucester et al. (1998) 6 M.P.L.R. 290 and on appeal (1979) 22 O.R. (2d) 652.

¶ 22 I am satisfied that upon a reading of the relevant provision of the Official Plan referred to above, that the said provision creates a combined use only designation for the site in question. That is the use of the word "including" following reference to the words "a community residential care access centre" indicates that the policy set out in the Official Plan contemplates that the restaurant in the Gage House should be included as part of the residential care access centre to the end that the community and residential care access centre use is only permitted if Gage House is maintained. A reading of the introductory provisions of the Official Plan Amendment confirms this.

¶ 23 Zoning By-law No. 99-058 was passed to implement the policy set out in the Official Plan above and the by-law should be interpreted accordingly. In my view the use of the word "and" after the words "a

community and residential access care centre;" in the relevant provision of the by-law provides for a permitted combined use, that is, the use as a community and residential access care centre is only permitted together with the restaurant use as accessory to and in conjunction with the community and residential access care centre. Thus the use of the almost completed building as a residential access care centre would be rendered illegal upon the demolition of the Gage House resulting in a contravention of Zoning By-law 99-058 if the building is used as a residential care access centre as is clearly intended by the applicant.

¶ 24 For the reasons set out above the application is dismissed with costs. Counsel have indicated to me that they have an agreement between them that the quantum of costs on this application be fixed at $5,000.00 and I so order.

On appeal from the judgment of Justice Kenneth C. Binks dated May 17, 2000, reasons reported at (2000), 35 R.P.R. (3d) 141.

CARTHY J.A.:

[1] This is an appeal from an assessment of damages.

[2] This appeal concerns the measure of damages arising from the contamination of the respondents' property by a gasoline spill from the appellant's neighbouring gas station. For reasons reported at (2000), 35 R.P.R. (3d) 141, Binks J. assessed the damages and granted judgment against Shell Canada Products Limited as follows:

(a) $550,000 for costs of remediation,

(b) $350,000 for loss of property value due to stigma associated with the contamination,

(c) $25,000 plus prejudgment interest for mortgage financing costs,

(d) $20,000 for business interruption loss,

(e) a direction that the appellant remediate its own property or in default pay the respondents $85,000 as the cost of a barrier between the properties to prevent further leakage,

(f) dismissing a counterclaim asking that the recovery be paid into court and used only for reparation of respondents' property,

(g) prejudgment interest on (a) and (b) in the amount of $442,012.81, and

(h) the costs of the proceeding.

[3] The appeal is against items (a), (b), (e), (f) and (g). In descriptive terms, the appellant says that the trial judge set too high a standard for remediating the soil, should not have found any residual loss in property value after remediation, should not have made a mandatory order against the appellant, should have protected the appellant against the respondents' potential failure to use the damages award for reparation, and should not have awarded prejudgment interest.

The Facts

[4] I will refer to the appellant as Shell and the respondents as Tridan. Shell has for some years operated a service station on Bank Street in Ottawa adjacent to a car dealership operated by Tridan. In September 1990, 9,000 liters of gasoline leaked from an underground fuel line on Shell's property. At first it was not known that fuel had in part escaped into the soil under Tridan's property. Shell undertook a remediation on its own property in accordance with government standards applicable at the time. Shell did not remove all of the contaminated soil and the evidence indicates that about 3,000 liters of fuel were unaccounted for. In 1991, Tridan discovered

that some of the gasoline had migrated into its soil, forming a plume about 14 feet below grade. Shell accepts responsibility for the required cleanup.

[5] For reasons that have no bearing upon the issues on appeal, the dispute over the extent of cleanup that was appropriate and the consequent costs and damages did not come to trial until October 1999, nine years after the spill. In the meantime, the car dealership carried on profitability but its mortgage financing was threatened by the decreased mortgage value occasioned by the pollution. Tridan faced increased interest charges and Shell, in an effort to minimize its exposure to a claim for damages on that account, executed an indemnity agreement with the mortgagee undertaking to pay for any necessary cleanup on demand by the mortgagee. The interest rate was consequently reduced to the normal rate and that element of potential loss was avoided.

[6] While the parties were wending their way to trial there were changes occurring in oversight by the Ministry of Environment (MOE).

[7] Several sets of MOE guidelines were in place during the period between the spill and trial, but the two sets that are most commonly referred to by the witnesses are the "Interim Guideline for the Remediation of Petroleum Contamination at Operating Retail and Private Fuel Outlets in Ontario", dated 1992 ("1992 MOE guideline"), and the "Guideline for Use at Contaminated Sites in Ontario", revised February 1997 ("1997 MOE guideline").

[8] The 1997 MOE guideline currently applies. Its stated purpose is to provide,

… advice and information to property owners and consultants to use when assessing the environmental condition of a property, when determining whether or not restoration is required, and in determining the kind of restoration needed to allow continued use or reuse of the site. The ministry has provided the guideline, along with the supporting documentation, to assist landowners in making decisions on soil and/or groundwater quality for proposed or existing property uses.

[9] Under the 1997 MOE guideline, the level of permissible pollutants varies depending on whether the property is used for agricultural, residential or commercial purposes. The relevant criteria for land used for commercial purposes is set out in Table B. Within Table B, permissible concentration levels vary depending on whether the groundwater is used for drinking purposes and on whether the soil at the contaminated site is fine, medium or coarse. Lower concentration levels of pollutants are permitted for coarse grain soil, since pollutants can travel more easily through coarse soil than fine soil.

[10] No one suggests that the guidelines supplant the common law standard of compensation for injury to land. However, Shell asserts that the MOE guideline represents a reasonable standard to apply to commercial lands that are contaminated but unaffected for the purpose being served. The difference in cost between meeting the 1997 MOE guideline and achieving a site which is clean of all contaminants, referred to in the evidence as a pristine site, is approximately $250,000, mostly referable to the amount of soil that must be removed and replaced.

Damages for Reparation of the Tridan Property

[11] The trial judge found that the plaintiffs were entitled to have their property remediated to pristine condition and assessed the cost of doing so at $550,000. Normally the assessment would be as of the date of the injury, but in the circumstances of this case the trial judge chose to assess damages as of the date of trial. No one contested that approach because no work toward reparation had taken place, the business of Tridan had continued throughout and current MOE guidelines were being asserted as the standard. Thus, it made sense for the trial judge to look to current costing information to arrive at an assessment.

[12] The trial judge might have relied upon those expert witnesses supporting the MOE guidelines as a reasonable measure of reparation and thus the damages suffered. This is a commercial property on a busy thoroughfare and unlikely to ever be a site for residential use. It might be concluded that in a practical sense Tridan is not likely to need or want to clean its soil at depth of every particle of pollutant. However, in the circumstances of this case I cannot say the trial judge erred in deciding that Tridan was entitled to reparation to a pristine state. Where a product that may cause mischief escapes to a neighbour's property there is responsibility "for all the damage which is the natural consequence of its escape." See *Rylands v. Fletcher*, [1861-73] All E.R. 1 at 7 (Ex. Ch.), cited with approval at p. 13 (H.L.). Of course, they must be reasonable. On all the evidence it is fair to conclude that the damages would not be eliminated by reparations to the point of the MOE guidelines. There would be residual loss of value,

referred to as stigma, which would be reduced, as the trial judge found, or eliminated, as I am about to find, by remediation to the pristine level.

Stigma

[13] An analysis of all the evidence brings me to the conclusion that there is no support for the trial judge's conclusion that there is a residual reduction of value in a pristine site caused by the knowledge that it was once polluted. It would appear that the trial judge simply misapprehended the evidence of the two principal witnesses for Tridan.

[14] Mr. Gordon Taylor from Royal LePage was qualified as an expert in commercial real estate by the plaintiffs. He testified as to stigma attaching to previously polluted sites and estimated a reduction of 17% to 18% of fair market value for this site if cleaned up to MOE guideline standards. His testimony was that there would be no impact if in pristine condition. He is consistent throughout but the point is emphasized in cross-examination [Emphasis added]:

Q. … [M]y understanding, sir, is that your opinion with respect to the stigma that would attach to the property is based on the fact that the property would be cleaned up to what you call Level II [under the relevant MOE guideline]

A. That's correct.

Q. But your view is that even if you cleaned it up, beyond that, if there was any hydrocarbons on the property, it would still affect the value; correct?

A. As opposed to being in pristine condition, you mean?

Q. Right?

A. Yes, it could.

Q. But here you are just looking at it from the purposes of cleaning it up to the Level II?

A. Yes, I was asked to report what is the impact market value [*sic*] between the Level II and pristine condition.

Q. So, if it is pristine, no impact?

A. That would be correct.

[15] The trial judge also relied upon another Tridan witness, Mr. Peter Boddy, a qualified appraiser, who testified that even after a cleanup there would be a 17% to 18% reduction in market value of the property. However, his report and oral evidence makes it clear that he was assessing a cleanup to MOE standards. In evidence he stated [Emphasis added]:

Q. And then having said that, you then proceed to express an opinion of what you think the stigma will be to the Donnelly site even after it is cleaned up?

A. Yes.

Q. And your opinion is based on the fact that it will be cleaned up to the applicable guidelines; is that correct?

A. Yes.

Q. And by that, we are talking about the Ministry of the Environment guidelines?

A. Yes.

[16] The references by the trial judge at pp. 158 and 159 of his reasons to the evidence of Shell's expert, Mr. Steven Granleese and the concessions he made in cross-examination, do not suggest that stigma would attach to a site cleaned to pristine condition. Indeed, they make no mention of a pristine site and make equal sense if it is assumed that the witness is referring to a cleanup to MOE standards. Granleese was called to refute Tridan's evidence that stigma attaches when the cleanup is to the MOE guideline level. He was not dealing with this specific property and whatever concession he may have made against his original position, it cannot supplant the Tridan witnessses' primary assertion that there would

be no impact on the value of this property if it was cleaned to the pristine level.

[17] In sum, the evidence compels me to conclude that there is no stigma loss at the pristine cleanup level. This conclusion also makes sense of the trial judge's holding that cleanup to the pristine standard was justified in this case. If the trial judge's assessment of stigma damage at $350,000 is taken as the diminution in value at cleanup to the guideline standard, then the more economical route is to proceed to the pristine level at an additional cleanup cost of $250,000 with no stigma damage.

[18] In my view, the only reasonable conclusion from the totality of the evidence is that a pristine site has no residual loss of value and that paragraph 1 of the judgment should be amended to reduce the amount awarded by $350,000.

Shell to remediate its own property

[19] There was evidence that if Tridan excavated and replaced the soil on its site, a barrier would be required to prevent further migration of the gasoline that remains on the Shell site. If both sites were cleaned at the same time, the barrier would not be needed. This led the trial judge to direct Shell to remediate at the same time as Tridan or pay a further sum of $85,000, being the estimated cost of a barrier. There is no basis for a mandatory injunction against Shell and no reason to complicate Tridan's remediation by joining it with that on the Shell site. It must be kept in mind that these damage recoveries may never be invested on remediation. They are based on costs but are the equivalent of a diminution in property value. A purchaser of the Tridan property in its present form would probably reduce the offering price by, among other things, $85,000 for a barrier when remediation is undertaken.

[20] Paragraph 6 of the judgment should be amended so that it reads as a simple obligation to pay $85,000 and paragraph 7, providing for the notice of intention to effect remediation, should be deleted.

Counterclaim for payment into court

[21] In order to avoid a substantial and ongoing claim for increased mortgage interest charges occasioned by the pollution, Shell signed an indemnity in favour of Tridan's mortgagee undertaking to effect reparation on demand. Its present concern is that if the judgment award is paid to Tridan it may not be used for remediation and Shell may have to pay twice should the mortgagee issue a demand. To protect its position Shell asks that the reparation costs be paid into court and released only as reparation is undertaken. Shell certainly has a problem, but it is with a non-party to this litigation and a contract that is not before the court for adjudication. An order for payment into court would not only abridge Tridan's right to deal with its damages as it sees fit, but would also place the court in the position of overseeing the reparations and the satisfaction of the requirements of the indemnity.

[22] Shell's obligations to the mortgagee will have to be resolved in other proceedings. I would dismiss the appeal from this aspect of the trial judgment.

Prejudgment Interest

[23] The trial judge allowed prejudgment interest for the 10 years prior to judgment in the total amount of $442,012.81. Prejudgment interest is compensation for being deprived of damages from the date they are suffered. If damages are paid on that date, the plaintiff receives the benefit of the money and its investment value. If not paid, as is the normal circumstance, an interest award is made. Here, if Tridan had undertaken immediate reparation, that model would fit. If the loss had been assessed on property values and costs in 1990, it would fit. If the respondents had not been able to run a successful business in the interim, a claim for prejudgment interest might be justified. Yet on the actual facts there would be a clear double recovery if prejudgment interest were awarded: the assessment is in dollars current to the trial, Tridan has not suffered since the spill, and the dollars are to be spent in the future. If the costs of reparation increase, postjudgment interest and investment income will cover the difference. Section 128(4)(d) of the *Courts of Justice Act*, R.S.O. 1990 c. C.43 excludes prejudgment interest on "pecuniary loss arising after the date of the order and that is identified by a finding of the court." The damages for remediation of the Tridan property came within this exclusion and prejudgment interest should not have been awarded on that amount.

[24] I would allow the appeal against that award and delete the item from the judgment.

Conclusion

[25] The appeal should be allowed in the respects identified in these reasons with costs to Shell.

1423107 Ontario Inc. v. Woodstock (City)

Between
1423107 Ontario Inc., applicant, and
The Corporation of the City of Woodstock and David Creery, in his capacity as Chief Building Official for The Corporation of the City of Woodstock, respondents

[2001] O.J. No. 1330
Court File No. 462/00

Ontario Superior Court of Justice
Woodstock, Ontario
Heeney J.

Heard: March 5, 2001.
Judgment: April 2, 2001.
Counsel:

Elizabeth K. Cormier, for the applicant.
Murray L. Coulter, for the respondents.

¶ 1 **HEENEY J.**:— The applicant applied for a building permit to convert leased premises in the City of Woodstock for the proposed use of the premises as a "health club". One of the principle activities that was proposed to take place on the premises, and indeed the only activity that has taken place on the premises since the applicant opened for business in September 2000, is the provision of full nudity non-therapeutic body massages. The Chief Building Official refused to issue a building permit, on the basis that such a use was not a "health club", and was not otherwise a permitted use within the Restricted Industrial Type 1 Zone (M1) in which the premises are situated.

¶ 2 The applicant appeals the decision of the Chief Building Official. An appeal lies to this Court pursuant to s. 25(1) of The Building Code Act, S.O. 1992, c. C.23. The powers of the Court on such an appeal are set out in subsection (4):

> (4) If an appeal is made under this section, the judge shall hold a hearing and may rescind or affirm the order or decision of the inspector or chief building official or take such action as the judge considers the inspector or chief building official ought to take in accordance with this Act and the regulations and, for such purpose, may substitute his or her opinion for that of the inspector or chief building official.

¶ 3 I am, therefore, standing in the shoes of the Chief Building Official, and if I determine that his decision was incorrect I may make any order that he ought to have made in the circumstances. The applicant seeks an order that the requested building permit be issued.

¶ 4 The relevant law that defines the obligation of the Chief Building Official to issue a building permit is found in s. 8(2) of the Building Code Act:

> (2) The chief building official shall issue a permit under subsection (1) unless,
>
> (a) the proposed building, construction or demolition will contravene this Act or the building code or any other applicable law;

¶ 5 Simply put, the applicant argues that the Chief Building Official refused to issue the building permit based on a review of the floor plan, his attendances on the premises and discussions with the persons involved in the business, and on his personal opinion of what constituted a "health club". The applicant submits that this is not "other applicable law" and that the Chief Building Official acted outside his authority in refusing to issue the building permit.

¶ 6 I do not accept this argument. One of the main authorities relied on by the applicant was Axelrod et al. v. Corporation of The City of Toronto (1981), 15 M.P.L.R. 143 (Ont. Div. Ct.). That case held that it would be "irrational" to suggest that the Chief Building Official is precluded from considering zoning by-law compliance on a building permit application. The zoning by-laws constitute "other applicable law" within the meaning of this section.

¶ 7 In the case at bar, the Chief Building Official did nothing more than review the permitted uses provided by Woodstock Zoning By-law No. 5899-81 for an M1 zone, interpret the meaning of the phrase "health club", examine the evidence as to the use that was proposed to be made of the premises, and arrive at the conclusion that the proposed use did not comply with the zoning by-law. All of this he was, in my view, quite entitled to do.

¶ 8 Ms. Cormier, for the applicant, makes much of the fact that "health club" is not defined in the zoning by-law. Of the 26 uses permitted in an M1 zone, only 8 are defined, and the balance are undefined. Ms. Cormier suggests that the Chief Building Official had no authority to interpret the phrase "health club" and draw his own conclusions as to whether the proposed use was or was not a health club. She suggests that the Chief Building Official essentially had no choice but to issue a building permit, because the applicant labeled their proposed operation as a health club in their application.

¶ 9 Again, I find no merit to this submission. Statutes and by-laws are filled with undefined terms, and it is incumbent upon those charged with applying those laws to interpret them. If their interpretation is not correct, the error can be rectified by the Courts. That is precisely what happened in another case upon which the applicant relies, 789617 Ontario Inc. c.o.b. as The Spa on Maitland v. Toronto (City) and Nixon, Commissioner and Chief Building Official for Toronto (City) (1990), 75 O.R. (2d) 475 (Dist. Ct.). That case dealt with whether a proposed use constituted a "commercial bath", which term was not defined in the zoning by-law. The Chief Building Official interpreted that term and denied a building permit, but his decision was appealed to the District Court. Herold D.C.J., standing in the shoes of the Chief Building Official, proceeded to arrive at his own interpretation, and determined that the proposed use fit within the meaning of the phrase.

¶ 10 It is also important to recognize that the Chief Building Official was not compelled to issue a building permit simply because the applicant labeled its proposed operation as a "health club". A facility or a business is not defined by what it chooses to call itself, but rather by the activity that it actually engages in. A label can be entirely misleading as to the true nature of the use to which the premises are being put. For example, an owner constructs an asphalt skateboard park. He may choose to call it a parking lot, but that does not make it one. If the actual and proposed use of the premises is skateboarding, then it is a skateboard park no matter what the owner chooses to call it.

¶ 11 The proposed use of the premises is, therefore, a question of fact to be determined not by the label used in the application for a building permit, but by an examination of the activities that are proposed to be carried out on the premises.

¶ 12 Before examining those activities, it is appropriate to first consider the zoning by-law itself. Like most zoning by-laws, it is written in prohibitory terms: all uses are prohibited except those specifically permitted. Section 19.1 of the by-law reads as follows:

> No person shall within any M1 Zone use any lot or erect, alter or use any building or structure for any purpose except one or more of the following M1 uses.

¶ 13 Section 19.1.2 of the by-law goes on to list 26 permitted non-residential uses. Among those uses is "a health club". It is common ground that the use proposed by the applicant cannot fit within any of the other 25 permitted uses. The question to be determined, therefore, is whether the use proposed by the applicant is a "health club". If it is, it is a permitted use, and the building permit should issue. If it is not, it is a prohibited use and the building permit should not issue.

¶ 14 As to the rules that should be brought to bear in interpreting the by-law in question, Ms. Cormier relies on the following principle of law stated in I.M. Rogers, The Law of Canadian Municipal Corporations (2d), Carswell 2000, at s. 135.2:

> On the other hand, the courts have more frequently applied the rule of strict construction: common law rights cannot be held to have been taken away or affected by a statute or by-law passed under its authority unless it is so expressed in clear language. ... So if there is any uncertainty or doubt whether a restriction applies to a particular property the matter will be resolved in favour of the owner. ... If expressions used in a by-law are of doubtful meaning in their application that doubt must also be resolved in favour of the owner. So as a general rule, any ambiguity or uncertainty with respect to its construction should be resolved in favour of the owner.

¶ 15 Ms. Cormier has cited a number of cases as well that support the same proposition.

¶ 16 I agree completely with this statement of the law. If I find the meaning of the phrase "health club" to be ambiguous, or if there is any uncertainty as to whether the applicant's proposed use fits within that phrase or not, such doubt or ambiguity should be resolved in favour of the applicant.

¶ 17 So what does the phrase "health club" mean? The New Lexicon Webster's Dictionary of the English Language defines "health" as "the state of fitness of the body or of the mind". The word "club" is defined as "an association of people with some common interest who meet periodically" or "an association of people enjoying premises which provide them with reading and recreation rooms, meals, occasional residence, etc."

¶ 18 These dictionary definitions accord with the ordinary meaning of the phrase in everyday parlance, of which I take judicial notice. A health club is generally understood to mean a facility where people sign up as members for a fee, giving them access to the facilities for a defined period of time, usually measured in months or all or part of a year. The facilities include, as a predominant feature, weight machines, exercise machines and other apparatus and facilities designed for the development of physical fitness. It is customary to have change and shower facilities on the premises. A health club could also include features such as a steam room, a sauna, a spa and perhaps even swimming facilities. Therapeutic massage would normally be considered as an appropriate component of a health club.

¶ 19 The activities that the applicant proposes to carry on at the premises in question are as follows: full nudity non-therapeutic massage; tanning; hot tub spas; an exercise room with a Universal weight machine, a treadmill and a stationary bicycle; showers and washrooms; and a lounge area offering juice and water.

¶ 20 I will deal first with the massage aspect of the applicant's operation. As noted above, massage is currently the only service being offered by the applicant. The explanation given is that they are awaiting the building permit to complete the renovations before installing the exercise equipment.

¶ 21 Charles Wilson, a representative of the applicant, was cross-examined as to the nature of the massage services being offered. The following points emerged:

* When a customer attends the premises, he or she would see a price list for various massage services being offered. No membership fees nor membership requirements of any kind are applicable to determine who is entitled to make use of the premises;
* The customer would determine if he or she wanted a male or a female attendant;
* The customer would then "get naked", although the customer could choose to leave his or her underwear on;
* The attendant would proceed to "get naked";
* The attendant would then administer massage for an hour or a half-hour depending on the service ordered;
* When asked whether anything else would happen during this time, his response was "not that I know of";
* If the customer chose the hot tub option, the attendant and the customer would spend the first half-hour in the hot tub together, naked, which would be followed by a half-hour massage;
* No qualifications of any kind are required for the attendants administering the massages. It is not necessary that they be registered massage therapists or have any other designation, nor even that they have ever done massages before.

¶ 22 Section 224 of the Municipal Act, R.S.O. 1990 c. M.45 provides for the regulation, by the municipality, of "body-rub parlours". Subsection (9) sets out the following definitions:

> "body-rub" includes the kneading, manipulating, rubbing, massaging, touching, or stimulating, by any means, of a person's body or part thereof but does not include medical or therapeutic treatment given by a person otherwise duly qualified, licensed or registered so to do under the laws of the Province of Ontario; ("massage")
> "body-rub parlour" includes any premises or part thereof where a body-rub is performed, offered or solicited in pursuance of a trade, calling, business or occupation, but does not include any premises or part thereof where the body-rubs performed are for the purpose of medical or therapeutic treatment and are performed or offered by persons otherwise duly qualified, licensed or registered so to do under the laws of the Province of Ontario. ("salon de massage") R.S.O. 1990, c. M.45, s. 224(4-

9).

¶ 23 Ms. Cormier concedes that the definition of "body-rub" set out above accurately describes the massage services provided by the applicant. It follows that the part of the subject premises where such services are to be performed could be accurately labeled as a "body-rub parlour".

¶ 24 We have, therefore, one label that accurately describes this activity that the applicant proposes to carry on at the subject premises, and has, in fact, carried on there since September of 2000. The question remains whether the label "health club" also fits.

¶ 25 It is conceded by Ms. Cormier that the massage services offered by the applicant are non-therapeutic. Thus, they are not offered with a view toward the health or fitness of the customer. Rather, they are offered for the entertainment or recreation of the customer.

¶ 26 This point is graphically illustrated by the fact that the attendant is required to "get naked". Clearly, no "health" objective is advanced by having the attendant disrobe. The only rational reason for doing so is to enhance the entertainment value of the experience to the customer.

¶ 27 The fact that the attendants are not required to be trained masseurs, to have any designation whatsoever, or even to have ever performed massages before, also sheds considerable light on the nature of the service being provided by the applicant. If the service had fitness of the body or mind as its objective, one would expect that the persons administering this service would be required to have some training in the field of fitness. The lack of any such requirement leads one to conclude that a person is qualified to be an attendant simply by virtue of being willing to completely disrobe and rub the body of a customer.

¶ 28 There is also no evidence that the proposed use will constitute a "club". There is no evidence of a membership requirement for use of the facilities. Services are simply offered to any customer who enters the premises, based on the fee schedule posted.

¶ 29 I conclude, therefore, that the massage aspect of the applicant's proposed use of the premises does not fit within a fair interpretation of the phrase "health club". I find no ambiguity in that phrase, nor is it uncertain whether the applicant's massage operation falls within that phrase. Accordingly, such a use is not permitted within an M1 zone.

¶ 30 The next aspect of the applicant's proposed use of the premises is tanning. The applicant proposes to install one or more tanning beds, but has not done so to date. No evidence was led one way or the other as to the nature of such an activity. Specifically, there is nothing to suggest that tanning promotes fitness of mind or body. Indeed, it is well recognized that excessive tanning poses a risk of skin cancer and other skin problems. Generally, tanning can be characterized as a cosmetic activity, engaged in by those who are of the view that a tanned skin enhances their attractiveness. Because of this, it is not surprising to find that tanning facilities are frequently associated with beauty salons. In the absence of any evidence that tanning promotes health, I am unable to conclude that the tanning aspect of the applicant's proposed use of the premises fits within the phrase "health club".

¶ 31 The next proposed use of the premises involves hot tub spas. While the use of spas in connection with naked non-therapeutic massage has no obvious connection to the promotion of fitness of mind or body, hot tub spas are generally accepted to be of therapeutic benefit, particularly with respect to the relaxation of muscles and treatment of musculo-skeletal ailments. While I am not satisfied that the hot tub spas in question here are to be installed for that purpose, I am left with some uncertainty as to whether this aspect of the applicant's proposed use of the premises fits within the definition of "health club", and that uncertainty will be resolved in favour of the applicant. I pause to note that the concerns as to whether this operation can be considered as a "club" remain, but those concerns are, in view of the rules of interpretation that I must apply here, sufficiently overridden if the applicant can fit within the "health" aspect of the phrase.

¶ 32 Next, the applicant proposes to install a weight machine, treadmill and stationary bicycle. There is no question that such activities fall squarely within a reasonable interpretation of the phrase "health club" (bearing in mind my comments as to the "club" aspect of the phrase). Thus, such a use is a permitted use.

¶ 33 Finally, the applicant proposes to have showers and washrooms, and a lounge area with a juice bar. These facilities would normally form part and parcel of a health club. Given that the exercise rooms and spas are permitted activities, the showers, washrooms and lounge can properly be

considered as being an integral part of that use, and would similarly be permitted.

¶ 34 The conclusion that I arrive at, then, is that the use of the premises for full nudity non-therapeutic body massage is not permitted by the applicable zoning by-laws, nor is the operation of a tanning bed facility. The applicant would, however, be permitted to use the premises for the proposed use involving exercise equipment, spas, and the shower/change rooms and lounge that support and form part of such activities.

¶ 35 Having determined that part of the applicant's proposed use of the premises fits within the zoning by-law, can the massage aspect of the operation be legitimized as an "accessory" to the permitted uses? Section 6.1.1.1 of the zoning by-law provides as follows:

> An accessory use which is normally, naturally and customarily subordinate and clearly incidental to a permitted use is permitted if:
>
> (a) it is on the same lot as the use to which it is accessory;
> (b) it is not a use which is capable of having an independent existence on its own;
> (c) it must not be used for human habitation except as permitted in Section 62.3 to this By-law; and
> (d) it must comply with the provisions set out in Table 1 below.

¶ 36 In order to satisfy the requirement that the accessory use is "customarily incidental" to the permitted use, there must be evidence that such accessory services are frequently and normally offered in Ontario in conjunction with the permitted services: Re Convenience Services Ltd. and City of Sault Ste. Marie et al. (1980), 30 O.R. (2d) 660 (Div. Ct.). There is no evidence that this is the case. Indeed, the contrary conclusion is obvious. The average citizen would be shocked to find that the local Y.M.C.A. was offering full nudity non-therapeutic body massages as part of its health club menu of services.

¶ 37 It must also be proven that the accessory use is "subordinate" to the permitted use. Again, the evidence points to the opposite conclusion. The only services provided to date are massage services. However, the applicant has yet to install its exercise equipment. Mr. Wilson was cross-examined as to his projections as to how the income from massage services would match up to the income from the exercise equipment and other services to be offered. His response was "Hopefully I hope it would weigh all out even".

¶ 38 I infer that massage services will, at the very least, be one of the main services being offered at the proposed facility. Thus, it cannot be said that massage services will be "subordinate" to the provision of exercise machines and spas. My conclusion is that massage services do not meet the definition of an "accessory use", and cannot be permitted on that basis.

¶ 39 I should not leave this area of enquiry without dealing further with the Spa on Maitland case, supra, upon which the applicant heavily relies. It dealt with a proposal to establish a commercial bath catering to men only. The zoning by-law permitted a "commercial bath". The Chief Building Official observed that the area to be used for bathing comprised only around 15% of the total floor space, and that the balance was to be used to provide 62 change or rest cubicles that were to be rented out for six-hour periods, steam baths, a lounge area, locker rooms and offices. On that basis, he denied the application for a building permit.

¶ 40 Herold D.C.J. allowed the appeal and ordered the building permit to issue. At first blush, this might be considered as authority for the proposition that, so long as 15% of the premises was to be used for a use permitted by the by-law, that would be sufficient. However, Herold D.C.J. did not say that. Instead, he said the following (at p. 478-9):

> A fair interpretation of commercial bath, in my view, would include the recreational, social, steam, shower and rest facilities proposed by the applicant. Accordingly, absent a clear legislative intent to restrict, or prohibit, the type of operation proposed by the applicant, the proposed use does not contravene the zoning by-law ...
> [emphasis added]

¶ 41 In other words, all of the facilities proposed by the applicant were part and parcel of what one would expect to find in a commercial bath, so that the facilities as a whole complied with the zoning by-law. Since the facilities complied with the by-law, and since there was no other legislation

to restrict or prohibit all-male bath houses, the building permit should have been issued.

¶ 42 By contrast, the full nudity non-therapeutic massage services offered by the applicant are not part and parcel of what one would expect to find in a health club. The provision of those services is a separate and distinct use, which is not permitted by the zoning by-law.

¶ 43 If the applicant submits a revised application that restricts the use of the premises to the permitted uses outlined above, and deletes the prohibited uses, it would be entitled to a building permit. However, the application that was before the Chief Building Official, and which is now before this Court, includes both permitted and prohibited uses, and the Chief Building Official was correct in refusing to issue a building permit.

¶ 44 I conclude my reasons by observing that there is not, in this case, the "alternative lifestyle" subtext that was present in the Spa on Maitland bathhouse case. Body rub parlours, arguably, have a place in our liberalized society. Operating a body-rub parlour is a legal activity, albeit optionally subject to regulation by the municipality under s. 224 of the Municipal Act. Mr. Coulter concedes that, if they have to go somewhere, an M1 zone is probably the best place for them to be, since they would be away from schools and residential areas.

¶ 45 However, I must decide this case based on the zoning by-laws as they presently exist, not as they may be amended in the future. And as those by-laws stand at this moment, the applicant's proposed use does not comply.

¶ 46 The decision of the Chief Building Official is affirmed, and the appeal is dismissed. If the parties cannot agree on costs, I will entertain brief written submissions within twenty days.

HEENEY J.

Bakhtiari v. Axes Investments Inc.

Between
Zari K. Bakhtiari, Pedrum Sodouri and Pejman Sodouri, plaintiffs, and
Axes Investments Inc., Alfredo de Gasperis, Tandem Group International Inc., Tandem Group Management Inc., Tandem International Inc., Tandem International Investment Co., Tandem Investments Ltd., Paul Reid, Van Forbell, Merv Doctorow, John Broderick, Robert Macht, John Haughton, Intertec Security & Investigation Limited and City of Toronto, defendants

[2001] O.J. No. 4720
Court File No. 95-CQ-61731CM

Ontario Superior Court of Justice
Lane J.

Heard: January 8-11, 15-17, 19, 22-24, 26, 29, 30, 31, February 1, 2, 12-16, 19, 20, 23, 26-28, March 1, 2, 5, 6, 8, 13-16, 26 and 27, 2001.
Judgment: November 30, 2001.

Counsel:

Ian W. Outerbridge, Q.C. and Cynthia R.C. Sefton, for the plaintiffs.
Stuart Forbes, Q.C. and Jacqueline M. Weber, for the City of Toronto.
Barry A. Percival, Q.C., for the remaining defendants (except Haughton and Intertec).
No one appearing for the defendant, Merv Doctorow.

¶ 1 **LANE J.**:— In the early morning of January 6, 1995, a fire broke out in suite 509 of 2 Forest Laneway, a high-rise residential building in what was then the City of North York. No one burned to death, but six tenants died in the stairwells from smoke inhalation while trying to escape the smoke that spread throughout the building. Numerous others were injured, including the plaintiffs Zari Bakhtiari and her son Pedrum

Sodouri. Nine actions were brought and were ordered tried together. In the end only one injury action and one property damage action were heard by me, all others having agreed to abide the result as to liability. The actions against John Haughton and Intertec Security & Investigation Limited were dismissed on consent before trial.

Synopsis of the Facts:

¶ 2 The fire began in apartment 509, evidently as a result of careless handling of a cigarette which set a couch on fire. The polyurethane content of the couch created thick, black smoke. The tenant, the defendant Doctorow, opened the balcony door, presumably in an effort to clear the smoke, but then fled the apartment, without closing either the balcony door or the suite door behind him. As it was not equipped with a self-closing device (SCD), the suite door remained open. Fed by the fresh air, the fire grew and the smoke and flame escaped into the hall on the east side of the 5th floor.

¶ 3 The building contains two stairwells for use in case of emergency. They are of a "scissors" design such that each stair crosses the width of the building between each floor and so alternates in serving the east and west sides. On the 5th floor stair S1 opens into the east hall, more or less opposite the door to suite 507 and near to 509, and stair S2 opens into the west hall. The doors between the hall and the stairwell are required to be equipped with SCDs and the 5th floor exit from the east hall was so equipped. However the firefighters found it open and there is reason to think that it malfunctioned. When, a little more than 15 minutes after the first alarm, the firefighters attempted to move up the stairs from the 4th floor level on stair S1, they found flames and thick, black smoke coming into the stairwell through the open exit door from the 5th floor blocking their way.

¶ 4 The result of the open exit door on S1 at the 5th floor was to create a "stack effect", a well-known phenomenon, in which the stairwell became a chimney venting the smoke from the 5th floor upwards. At the top of S1 was a hatch leading to the roof, designed to open in case of fire. It did not open and the smoke could not vent to the open air, but accumulated in the stairwell.

¶ 5 Zari Bakhtiari and her twenty-year-old son Pedrum Sodouri lived in apartment 1702, located in the southwest quadrant of the building. With their consent, they were referred to as Zari and Pedrum throughout the trial and I will continue the practice. Pedrum was awakened shortly after 5 a.m. by the sound of the building fire alarm and a few minutes later heard noises in the hall. Opening the suite door, he found that other tenants were in the hall, leaving their suites. There was a light layer of whitish smoke near the hall ceiling. He concluded that it was a real fire and awakened his mother. They dressed and walked to the stair exit on the west side. At the 17th floor, that exit led them into stair S1. (There is no 13th floor, so that S1 serves the east corridor on 5 and the west corridor on 17.) In the stairwell they joined a group of about five persons who were descending. About five floors down they met another group ascending, who said the smoke was too thick below. The entire group began to ascend. As they did so, they checked the floors they were passing, but found heavy black smoke on each, apparently coming from the ventilation system outlets high on the wall of the hallways.

¶ 6 The group continued to ascend, hoping to escape to the roof. At the top of S1 there was a door at the landing and a hatch in the roof. The door led to the mechanical room which had an exit to the roof, but the door was locked and did not respond to any of the keys carried by the tenants. The hatch had not released automatically and they could not get it to release manually. Trapped, the group turned to descend, but the thick black smoke came up the stairwell and they passed out. Pedrum and Zari were rescued by fire fighters wearing air masks. Pedrum was found in S1 at the mechanical room level and Zari in S1 one floor below, the 30th floor. Pedrum's last memory was of them being together and there was an issue as to whether she had fallen down the stairs from the mechanical level to the 30th floor.

¶ 7 Zari was in a coma for 11 days. She suffered brain damage due to hypoxia, carbon monoxide and smoke inhalation. She has essentially no memory of the fire. Near the end of the trial, the defendants admitted that she would not work again as a result of her injuries. Pedrum was unconscious when found, recovered consciousness in the lobby briefly and again at the hospital. He has returned to school. He also suffered from hypoxia, carbon monoxide and smoke inhalation and it is submitted that he too suffered brain damage which will impact upon his future. The plaintiff Pejman Sodouri, son of Zari and brother of Pedrum, claims under the Family Law Act for loss of care, guidance and companionship. These matters will be dealt with in detail later.

The Defendants:

¶ 8 At the north-east corner of Yonge Street and Sheppard Avenue in the former City of North York, now Toronto, there is a large apartment and commercial complex which includes three apartment buildings, numbers 2, 4 and 6 Forest Laneway. Number 2 Forest Laneway is a 30-storey apartment building with approximately 300 tenants and 700 other residents, in all some 1,000 inhabitants. The plans for construction were approved by North York in 1974. A Building Permit was issued in 1974 and the building was constructed in 1975. In about 1986 the Tandem group acquired the entire complex of commercial and residential buildings.

¶ 9 The defendant, Axes Investments Inc. ("Axes") was, at the time of the fire, the registered owner of the apartment buildings at 2, 4 and 6 Forest Laneway. Axes acquired the residential portion of the complex by transfer November 29, 1988 for $71,000,000. Axes is not a beneficial owner of the residential property, but a nominee and trustee which holds title for three co-tenants, Con Drain Company Limited, Hydralfield Building Inc. (In Trust) and 607507 Ontario Limited. Tandem Group Management Inc. were the property managers for Axes of these buildings and others, (at the time of the fire Tandem managed approximately 50 to 100 properties). 607507 Ontario Limited was itself a nominee corporation that held a 1/6 interest for various members of the Tandem Group.

¶ 10 Tandem handled the day to day management of financial affairs as the property managers and from time to time would meet with the officers of the co-tenancy on "macro" issues, including when and how to fund the Fire Code retrofit program identified in 1994 by the report of the engineering firm SPG, of which more later.

¶ 11 The defendant, De Gasperis, was the president and a director of Axes. He swore the affidavit of value when Axes acquired the three apartment buildings in 1988. He did not testify at the trial.

¶ 12 The defendant, Forbell was at the time of the fire the president and a director of the Tandem Group. He was in charge of the company administration, financial affairs and staff policies. Ultimately, he had responsibility for the property management. Part of his examination for discovery was read in and gave the details of the ownership changes. He did not testify at the trial.

¶ 13 The defendant, Paul Reid ("Reid") was at the time of the fire the on-site property manager for the Tandem Group. He did not testify at the trial.

¶ 14 The defendants Robert Macht ("Macht") and John Broderick ("Broderick") were at the time of the fire employed by Axes or Tandem Group as the superintendents of, respectively, 2 and 4 Forest Laneway. On the morning of the fire, Broderick was on night duty responsible for the whole complex and Macht was off-duty. Both were physically present on site at the fire scene. Broderick testified at the trial under subpoena from the plaintiffs pursuant to Rule 53. Macht did not testify at the trial. He was said to have disappeared.

¶ 15 The defendant Merv Doctorow was the tenant of suite 509 at 2 Forest Laneway at the time of the fire. Although he filed a Defence, he did not appear at the trial. His careless handling of a cigarette caused the fire and so contributed to the injuries and deaths which ensued. The plaintiffs are entitled to judgment against him.

¶ 16 The defendant City of Toronto is sued as successor to the former City of North York pursuant to the amalgamation of the municipalities of the former Metropolitan Toronto. As it was North York at the relevant times, I will refer to it, for the most part, by that name. It is sued for acts or omissions alleged in respect of the original approval of the plans in 1974, in respect of the retrofit program in 1994 and in respect of the fighting of the fire.

The Fire: Origin, Spread and Cause: Evidence from the Fire Marshal:

¶ 17 Ontario Fire Marshal (OFM) lead Investigator William Hiscott testified at length at the trial. He had led the investigation by the OFM in 1995. He became a police officer in 1972 and moved to the OFM in 1990 as an investigator. At the time of trial he had investigated nearly 600 fires, of which more than 30 were high-rise fires. Of the latter group, all but 2 had been confined to the suite of origin. In 1995 he already had investigated over 330 fires. He was unquestionably qualified to give expert evidence in the field. He arrived at 2 Forest Laneway while the fire was still burning and conducted his investigation continuously thereafter. His report dated August 31, 1995, was put in on consent as part of Exhibit 13, being Volume I, Tab 2, pp. 35 to 155. The conclusions he drew then and to which he testified, are largely uncontradicted and I accept them.

¶ 18 It is convenient at this point to note that Exhibit 13 just referred to, consists of six volumes and 1574 pages. When these volumes were tendered on January 11, 2001, it was apparent that there were many documents whose authors would not be called. Counsel for the defendants asked for time to consider if there were any objectionable documents. On January 15th they advised there were no objections and all documents could be considered as properly part of the exhibit. Some of the reports of the OFM witnesses contained and relied on hearsay statements, including some from tenants in the form of statements taken at the time and included in Exhibit 13. These have been regarded as fully reliable as to the facts in them.

¶ 19 Mr. Hiscott said that the evidence in suite 509 and information received from the tenant, Doctorow, were consistent with the fire starting with the dropping of a hot cigarette butt into the cushion of the couch in the living room. A large quantity of thick, black smoke developed due to the polyurethane foam content in the couch. The report noted (at page 74): "Due to the actions of the occupant opening the patio door and leaving the suite door open, the fire burned freely consuming most of the combustibles contained in the couch." Ultimately, the entire contents of the living room were consumed so that physical examination could not independently confirm an exact cause for the fire. Other possible sources, such as appliances, were examined and ruled out.

¶ 20 The fire spread through most of the suite and at least the living/dining area went to the point of flashover. Mr. Hiscott explained that each combustible material has an auto-ignition point: a temperature at which it will burst into flame. When the heat of a fire gets very intense, the temperature reaches and surpasses the auto-ignition points of most materials and flashover is the moment when essentially all combustible materials self-ignite, resulting in a sudden increase in the intensity of the fire. The open balcony door provided the fire with ample oxygen and Mr. Hiscott said that flashover would have occurred relatively early in the fire. His colleague, Mr. Harpur, said flashover occurred at about the time the first firefighters arrived, that is at about 5:14 a.m., based on evidence from the tenants in 511 and 809.

¶ 21 Mr. Hiscott noted that none of the suite doors in 2 Forest Laneway were equipped with SCD's and thus the door to 509 remained open, allowing the fire to escape to the hallway where it ignited the corridor carpet and wallpaper, and allowing smoke to escape into the rest of the building. His examination of the physical remains of the door, the bottom 2" to 3", in place after the fire, confirmed that it had remained in the open position. He expressed the opinion that had there been an SCD on the suite door the fire would have been confined to 509. The heat and smoke would have been forced to vent out the windows and open balcony door, rather than into the building. He pointed out that the wooden hollow-core door to the north-west bedroom in 509, not as fire resistant as the solid wood suite door, had sufficed to keep the fire out of that room.

¶ 22 Mr. Robert Harpur P. Eng., also from the OFM, holds a degree in engineering and has been in fire protection work since 1978. He has studied smoke movement and smoke control design and has investigated many fires. He was qualified as an expert. His evidence was also essentially uncontradicted and I accept it. He performed fire resistance tests on a typical suite door from 2 Forest Laneway and found that, although it burned through to the extent of a 60 mm. hole in 13 minutes, less time than permitted under 1995 standards to be rated for fire resistance, it nevertheless: "remained essentially intact and in place and would have presented a useful barrier against the spread of fire and smoke in an actual fire." (Report, Ex. 13, vol. 1, p. 212). Of course, it would have had to have been closed to perform such a function.

¶ 23 Mr. Harpur also did tests on the carpet in the corridors at 2 Forest Laneway and reported that during combustion it produced quantities of dense black smoke. This probably contributed to the density of the smoke throughout the building.

¶ 24 Bernard Silvestri, also of the OFM, was called by the City and was conceded by the plaintiffs to be qualified as an expert. Again, his evidence was not contradicted by any other expert and I accept it. He said that most high rise fires are confined to the suite of origin, but that the escape of smoke from that suite into the rest of the building poses a major risk to all other occupants due to the poisonous nature of smoke, particularly smoke from the combustion of household furnishings. High-rise fires were not that frequent, but the problem was the enormity of the risk involved in each one. SCDs and smoke alarms were two inexpensive and common precautions which saved lives. Had there been an SCD on the suite door at apartment 509, the smoke would probably not have escaped from the suite.

¶ 25 On January 30, 1995, approximately 3 weeks after the fire, Axes/Tandem had self-closing devices installed on the suite doors to the

units at 2 Forest Laneway at a cost of $12,473.39 for supply and installation. It was not suggested that this was any sort of admission, but it serves to demonstrate the modest scale of the cost involved.

¶ 26 Not only was the 509 suite door open during the fire, but the evidence discloses that the fire exit door on the 5th floor leading to stair S1 was also open for a significant period of time, perhaps for the whole of the duration of the fire. Mr. Harpur said that the main mechanism of smoke movement into the stairwell and so through the building was through this open stairwell door. Such a door is intended to remain closed in order to prevent smoke contamination of the stairways, which are the primary means of escape for the tenants in a fire situation. He concluded that this fire was under the influence of a significant draft which allowed it to develop very rapidly and to spread to the corridor through the open suite door. It was a fire of unusual intensity and duration and generated "tremendous quantities of dense black smoke". Mr. Harpur concluded that both stairs were sufficiently contaminated with smoke as to be unusable from the 4th floor to the 30th floor as were most of the corridors above the 4th floor. The speed with which this happened was of significance. The 5th floor hall was smoke-filled within one-half to 2 minutes after the first alarm sounded. The lower levels of the stairs were probably contaminated within 4 or 5 minutes of the alarm sounding and the upper levels to the 30th within 15 and possibly within 10 minutes after the alarm. Smoke was thick in the 28th floor hallway between 5:15 and 5:20 a.m.

¶ 27 It is clear that the deaths and injuries were caused or contributed to by the rapid spread of smoke and fire escaping from the open suite door of 509 and then through the open fire exit door on the 5th floor S1 stairwell, which contaminated the stairwell and prevented the use of the stairway as a means of escape for the deceased and injured tenants. When and why was this fire exit door open?

¶ 28 Despite full inquiries, no one was found who had opened the 5th floor exit into stair S1. Such doors were required to be, and were, equipped with SCDs, so that, even if opened, they should close behind the person using them. This did not occur. If someone unknown opened the door in order to exit into the S1 stairwell, the door did not close behind that person. If no one opened it, then it must have opened under the pressure of the fire and accompanying drafts. Mr. Hiscott said in his report that the fire doors at 5 east and west were closed but not necessarily latched when seen by fleeing tenants. At some point they became open. The door on 5 west leading to S2 was opened by the firefighters to bring up a hose, but no conclusive answer could be found by the investigators as to why or when the S1 door on the east side came open.

¶ 29 The tenant of suite 2108, escaping down the S1 stairwell, passed by the 5th floor door during the first minutes of the fire, and observed that there was smoke streaming in, apparently from cracks around the door. This observation is consistent with Mr. Hiscott's conclusion that this door was closed but not necessarily latched. He continued down the stairs and arrived at the lobby as the first fire trucks arrived. That would have been at 5:14 a.m. He therefore passed the 5th floor door before the flashover which occurred at the time of the arrival of the Fire Department. He was not called and further detail of what he saw is not available.

¶ 30 The tenant of 1607, Mr. Harris, left his suite between 5:13 and 5:16 and went down S1. He encountered smoke at the 12th floor and by the 8th was forced to turn back. He returned to 16 and reported that the smoke was coming up the stairs as fast as he could walk. In the 16th floor hallway the smoke was very thick, coming in via the stairwell door and the vents in the hallway walls. He went back into his apartment and called 911. He estimated the time from hearing the alarm at 5:10 am until this call to be about 10 minutes. It is clear from comparing this experience with that of the tenant of 2108 that the change in conditions in S1 took place very rapidly after flashover.

¶ 31 The speed with which the smoke spread into the S1 stairwell and reached the upper parts of it leads to the inference that the main mechanism of that spread, the S1 5th floor east fire exit door, was open from very early on.

¶ 32 The 5th floor east fire exit door on the S1 stairwell was observed by firefighters Tony Comella and Sean Pearce to be wide open with flames coming out into the stairwell, minutes after their arrival at the scene at 5:24 a.m. They had been directed to the 4th floor where the decision was made to attack up the stairs from the west side, which would take them to the east corridor on the 5th. They were the first firefighters to arrive at the 5th floor via stair S1. As they ascended, they met great heat and there were flames shooting out from the hall through the exit door and up the stairwell, accompanied by large amounts of smoke. Firefighter Comella described this door as being "wide open", and warped at the top. He stated that there was a column of flame at the open door burning upwards approximately two-

thirds of the way up the door frame. The main force of the fire was venting through that door and up the stairwell like a chimney. The door was waving back and forth in the draft of the fire.

¶ 33 Comella's partner, firefighter Pearce, also saw the S1 stairwell door open at 5 East. He saw "lots of smoke and fire" venting up the stairway towards the 6th floor. Pearce testified that even before the firefighters applied water to this door, he saw that it was warped. Pearce also stated that he saw "hot spots" on the suite doors on the fifth floor, indicating that there was heat present sufficient to ignite those doors. This last evidence was corroborated by the post-fire inspection when Mr. Hiscott reported that the fire damage to the hall side of the doors to 507 and 511 was very deep and both were on the point of collapse. Pearce also testified that the heat in the stairwell was so intense that he and Comella took turns being at the nozzle, the most forward position, at 30-second intervals.

¶ 34 The fire exit door on the 5th floor S1 staircase was too badly damaged to be tested after the fire. Six SCDs were selected from various stair well doors to be tested for compliance with the U.L.C. standard for closing force of at least 36 Newtons. Three of those selected failed to generate the minimum closing force on at least one of the tests. Two averaged below the minimum force required.

¶ 35 In addition, Mr. Harpur conducted a series of on-site tests to measure the closing force of SCDs on certain stairwell exit doors under a variety of ventilation conditions, including an attempt to recreate the weather conditions of the morning of the fire. March 3, 1995, was a day with weather conditions reasonably comparable to the day of the fire. Of course, the added pressures generated by the fire itself could not be duplicated. In the first test, under normal operating conditions, all SCDs tested generated enough closing force to close the stairwell exit doors to the latched position. Normal conditions include closed suite doors and a slight positive air pressure in the hallways from the action of the ventilation system which delivers air to vents high in the wall. The air moves under the suite doors into the suites.

¶ 36 For the second test, suite 609 was selected as the test site and its balcony and suite doors were opened. When the fire alarm is activated, the ventilation system shuts down, so the test was conducted with it turned off. Mr. Harpur noted that this test created conditions that were similar to the initial stage of the fire, apart from the existence of the fire itself. It demonstrated that if the 6th floor fire exit doors were not properly latched, the east door would open and stay open some 11 inches and the west door would open 2.25 inches. The doors on the other floors tested would close even though the 609 doors were open. When, in the third test, the conditions were varied by opening the hatches at the top of each stairwell, the closing force exerted by the SCDs that were tested diminished, but was sufficient to close all but the two 6th floor doors.

¶ 37 Mr. Harpur concluded that, even under the conservative conditions of the test, the 6th floor fire doors, if not properly latched, could be opened and held open by the pressure differential created by the opening of the suite and balcony doors of suite 609. He conceded to Mr. Percival that, being unable to test the 5th floor door itself, he could not know if the SCD on that door would have latched it under the prevailing pressures.

¶ 38 Mr. Harpur also testified that if the 5th floor east exit door was properly latched at the time, it would not be forced open by a flashover from suite 509.

¶ 39 As noted above, with the 5th floor fire exit door open the S1 stairway acted as chimney (or "stack") for the heat, smoke and fire to move to the top of the building. This stack effect was a well-known phenomenon. It is recognized in the defendant City's Fire Department Training Information materials and Deputy Chief Stewart and Captain Cooper both acknowledged it in their evidence. Deputy Chief Stewart agreed at the end of his cross-examination that the stack effect played a significant role in this fire. The stack effect was the main way in which smoke migrated through the building, making the stairs impassable.

¶ 40 The smoke followed other routes as well to the upper parts of the building. Ventilation air was provided under normal conditions through vents in the hallway walls. There was a gap deliberately left under the suite doors to allow the air to enter the suites. The slight positive pressure was useful in keeping cooking smells out of the halls. The ventilation fans shut down automatically when the fire alarm was activated, presumably to avoid feeding the fire with oxygen. The system was protected against smoke migration by equipping each vent with a fire damper operated by a fusible link intended to melt and allow the damper to close in the presence of heat such as is generated by a fire. The damper in the 5th floor east hallway failed to close completely because the aluminum grille over the vent melted before the fusible link did and the melted metal prevented full closure,

although it did reduce the size of the opening. Throughout the fire this vent was an opening into the air system which permitted the migration of smoke from the 5th floor upwards into other hallways. This almost certainly accounts for the smoke sightings in hallways reported to 911 at a very early stage of the fire.

¶ 41 There was also some migration of smoke through the kitchen and sanitary exhaust ducts (limited by the closure of dampers activated by heat) and minor migration via elevator shafts and service shafts containing electrical and plumbing services. Nevertheless, the evidence supports the opinion of the Fire Marshall witnesses that the stairs were the main avenue of smoke migration.

The Allegations against the Axes Defendants

¶ 42 The plaintiffs claim in negligence against the defendant Doctorow; the defendants Axes/Tandem and their individual officers, directors and employees; and the defendant City (formerly the City of North York). They say that the liability of the defendants is joint and several under the Negligence Act, R.S.O. 1990, c. N.1, s. 1. They take no position on how liability ought to be apportioned by the Court as amongst the three separate groups of defendants. I will deal first with the allegations against the owners and the manager, "the Axes defendants" leaving North York until later.

¶ 43 The defendant Doctorow was responsible for the fire and fled his suite when he discovered it. He did not defend at trial and the plaintiffs have received judgment against him earlier in these reasons.

¶ 44 The plaintiffs say that defendants Axes / Tandem and their individual officers, directors and employees failed to take reasonable care in all of the circumstances from the time of Tandem's acquisition of the property in 1986/87 and Axes' acquisition of the residential complex in 1988 right up to and including the January 6, 1995 fire, to see that the tenants were reasonably safe with respect to the condition of the premises and the activities carried on at the premises: Landlord and Tenant Act, R.S.O. 1990, c. L.7; Occupier's Liability Act, R.S.O. 1990, c. O.2. The plaintiffs pleaded that judgment be granted against these defendants. The plaintiffs specifically requested that judgment be granted as against the defendant Macht by virtue of his failure to appear to give evidence in response to a subpoena properly served on his counsel under Rule 53. I will deal with the allegations against the officers and employees after reviewing the allegations against the corporations.

¶ 45 The particulars of the alleged lack of reasonable care of these defendants may be summarised:

(a) The suite doors did not have self closing devices which, when the doors were opened, would return the doors to the closed position;
(b) The Axes defendants ignored warnings, in the SPG report of January, 1994 in particular, that the absence of SCDs on suite doors was a Code violation;
(c) The SCD controlling the fire exit door on the 5th floor S1 stairwell did not function as it was intended to, due to lack of maintenance and inspection;
(d) The Axes defendants ignored warnings, in the SPG report, that many doors that were equipped with SCDs did not close properly;
(e) The Axes defendants did not follow their own Fire Plan, as approved by the Fire Department in 1990, requiring monthly inspections of all doors in fire separations and periodic checks of all such doors to ensure that they are closed; nor did they ensure that their employees understood that their duties included responsibility for keeping the doors to stairways closed at all times;
(f) The Axes defendants did not follow their Fire Plan or the Fire Code by conducting fire drills or providing tenants with instruction on fire situations.

¶ 46 The plaintiffs further allege that these defendants were under a positive obligation to make an inquiry into the safety of the building at the time that each acquired its interest, including the safety of suite doors. They were told in 1994 by the SPG report that the suite doors did not have such devices and that their absence was a Code violation. Although they received an extension of time to comply with the statutory requirement to install SCDs, that extension did not relieve these defendants from their obligation to the plaintiffs under the two relevant Acts noted above. The owners still had the obligation to take reasonable care for the safety of their tenants, and they did not.

The Response of the Axes Defendants:

¶ 47 In response to the allegations regarding SCDs on suite doors, the Axes defendants adopted at trial the submissions of North York that suite door closers were not required at the time of construction of the building in 1975, pursuant to By-law 22000 which was then in force. This submission is best dealt with in conjunction with the submissions of North York. They further submitted that if they were so required (as the plaintiffs argued at trial) Axes/Tandem, as subsequent purchasers, were unaware of this fact and were entitled to rely on the City having enforced its own By-law in 1975. This submission is part of the analysis of the duty to take reasonable care for the safety of the occupants.

¶ 48 The Axes defendants further submitted that after receiving the SPG report in 1994 advising that SCDs would be required on suite doors as part of the new Fire Code, they acted reasonably in obtaining, as the statute allowed, a two-year extension of the time for compliance. This also is part of the reasonable care point.

¶ 49 In response to the allegations relating to the 5th floor east fire safety door, the Axes defendants admitted that the door had become unlatched during the fire, allowing smoke and flames to enter the stairwell, but submitted that there was no evidence that the SCD had not complied with the Building By-law or the Fire Code. Further, there was no evidence as to how the door became unlatched; there were many tenants on the 5th floor who might have unlatched it while escaping from the fire. Accordingly, the Court should find no negligence on the owners or managers relating to that door.

¶ 50 As to the allegations relating to their alleged failure to follow their own Fire Plan or to conduct fire drills, the Axes defendants submitted that any such failure did not contribute to the injuries or deaths of the plaintiffs. They relied on the presence of instructional signs on each floor. They further submitted that the Webber Report (Report of the Public Inquiry into Fire Safety in High-rise Buildings, December, 1983) accurately reported the dilemma faced by occupants of high-rise buildings during a fire: stay or leave? In the 2 Forest Laneway fire, those who stayed in their apartments did not suffer injury; only those seeking to escape via the stairwells did.

Reasonable Care:

¶ 51 The obligation of the landlord as occupier was to "take such care as in all the circumstances of the case is reasonable to see that persons entering on the premises ... are reasonably safe while on the premises.": Occupiers' Liability Act, R.S.O. 1990 c. O.2, s. 3(1).

¶ 52 The duty to take reasonable care includes the duty to keep the premises in reasonable repair and is further spelled out in the Landlord and Tenant Act, R.S.O. 1990 c. L.7 s. 94(1) requiring that rented premises be "maintained in a good state of repair and fit for habitation during the tenancy ...", and in compliance with applicable health and safety standards.

Some Conclusions about the 5th Floor East Fire Door:

¶ 53 One of the central issues raised by the Axes defendants was that the opening of this door occurred without any negligence on their part. Although the Fire Marshall witnesses could not provide a "conclusive" answer to how and when the 5th floor east fire door came open, the evidence allows me to reach conclusions on the standard of the balance of probabilities.

¶ 54 The 1968 Building By-law under which this building was constructed, By-law 22000, required that such a fire exit door be provided with an approved self closing mechanism (s. 2.3.12.5 entitled Doors to Be Kept Closed, Exhibit 13, Volume II, Tab 13, p. 296). The 5th floor east door was so equipped. Both door and SCD were destroyed and could not be tested.

¶ 55 Mr. Harpur's testing of other doors from 2 Forest Laneway equipped with the same model of SCD showed a substantial proportion of those tested did not always close the fire door with the minimum force required by U.L.C. standards. The testing of the 6th floor fire exit doors showed that they would not close under the pressures created by the open balcony and suite doors at 609, even without the forces generated by the fire itself.

¶ 56 That the SCDs were not in uniformly good condition is shown by the report of the engineering firm SPG which reported to the building owners in its February, 1994 "Fire and Life Safety Study" at page 9: "We note that many doors that do have self-closing devices do not close properly." Additional evidence came from Mr. Yaman Uzumeri, now the

Chief Building Official and formerly, in 1995, the Building Commissioner of North York. He visited the site a few days after the fire to see how it had behaved under fire conditions. He specifically wanted to check the SCDs on suite and fire stair doors. He went up and down the stair wells checking SCDs. There were none on suite doors, which surprised him very much. As to the fire doors, he observed that many SCDs on stair well doors were not functional. Instead of closing the doors, they were permitting the doors to stand open. He said that a properly maintained SCD would keep the door closed.

¶ 57 No evidence was called by the owners to rebut Mr. Harpur's tests, the SPG report or the observations of Mr. Uzumeri. There was thus no evidence of any maintenance or inspection of these devices. The building Fire Safety Plan contained specific details of the periodic tests, inspections and checks required of the safety features of the building, derived from the Fire Code. It required monthly inspections of all doors in fire separations, which includes the stairwell doors. The Plan defines inspection as a physical examination to determine that the device will apparently perform in accordance with its intended function. Unfortunately, the evidence discloses it was not followed.

¶ 58 Mr. John Broderick, the superintendent of 6 Forest Laneway at the time of the fire, was called by the plaintiffs pursuant to Rule 53. He had been superintendent of another high-rise for another employer. On being hired for Tandem, he received no training and had never seen a copy of the Fire Safety Plan. He was completely unaware of the schedule for inspections and received no instructions to do any. He said the maintenance manager, Mr. Alex Popovic, was responsible for maintenance and testing. The Axes defendants did not call Mr. Popovic or anyone else to testify as to the maintenance practices in the buildings. I draw the inference that any such evidence would not have assisted their case.

¶ 59 Shortly before flashover, the 5th floor east fire exit door was closed though not necessarily latched, and a tenant passed by without great difficulty, although there was some smoke streaming into the stairwell through spaces around the door. He reached the ground just at the estimated time of flashover. It would not take long for a man in a hurry to go down to the ground floor. Shortly after flashover, a tenant was driven back up S1 from the 8th floor by thick black smoke which was ascending the stair as fast as he could. There was thus a radical change in the smoke conditions in a very short time. It seems highly probable that something occurred at flashover: either someone unknown opened the door and it would not close and latch behind that person, or the force of flashover blew open the door which was not properly latched because the closing force was not enough to close it to the latch point. In either case, the door did not operate as it was designed to do: close to the fully latched position. It seems unlikely that someone opened that door. The investigation did not find such a person. The nearby tenants from 507 went down the elevator; the tenant in 511 was still in the apartment at flashover; after flashover, the conditions in the hallway near the stair would discourage efforts to use it.

¶ 60 The most probable explanation for the open door at 5th floor east, and the finding that I make, is that it was not in the fully latched position and was blown open at flashover by the wave of air pressure generated at that time. A properly maintained SCD would have been closed to the fully latched position and would not have been blown open by flashover. Mr. Harpur testified that the force of the flashover would not have caused a closed, latched door to open, particularly when the open balcony door provided an alternative vent for the force of the fire.

¶ 61 The opening of the 5th floor east fire door was essentially due to lack of maintenance of the SCD. In my view, failing to regularly maintain the fire exit doors so that they could do their job is not taking reasonable care for the safety of the tenants: in short, it is negligence. There was a program in place on paper only; my conclusion on the evidence is that it was not carried out. Further, the Axes defendants received actual notice that their maintenance program was not effective in the SPG report in February, 1994, warning at page 9 and again at page 15, that many doors with SCDs in the building did not close properly. The evidence of Mr. Cleary, the Fire Protection Engineer whom North York put in charge of considering extensions of time for completion of retrofit, made it clear that proper maintenance of existing SCDs was not a retrofit issue, but a current maintenance requirement. Failure to attend to the problem when warned of it cannot be excused by reliance on the extended period in which to accomplish the retrofit. SPG estimated the cost of this maintenance as part of a package which included many maintenance items other than SCDs: the total cost was $15,000.

¶ 62 The negligence of the Axes defendants in failing to maintain the SCD left the door vulnerable to remaining open during a fire, as it did, and thus opened up the stairwell to the quantities of smoke which caused the injuries of the present plaintiffs. The evidence does not support the view

that smoke in such significant quantities would have been there in any event. That negligence caused or contributed to the injuries of the plaintiffs, indeed I think it was the single greatest contributor to the whole disaster.

Suite Door Closers:

¶ 63 The plaintiffs assert that even if SCDs were not originally required on suite doors, Axes/Tandem were negligent in not observing that there were none and taking action to remedy their absence. They submit that Axes/Tandem had an obligation to know their own business and to understand what had become public knowledge: suite doors without SCDs were dangerous.

¶ 64 Axes is a nominee, but it holds between 50 and 100 properties which Tandem managed for it at the time of the fire. The complex of which 2 Forest Laneway is a part is alone worth some $70 million. Axes/Tandem are a sophisticated combination with the resources to be aware of significant developments in their business, which included the managing of high-rise dwellings. A significant feature of the period around 1970 was the growing awareness of the dangers of smoke migration in high-rise fires. In the 1970 edition of the National Building Code the following appears as the Introductory Note to new Subsection 3.2.6 under the heading "Additional Requirements for High Buildings":

> Experience with high buildings has shown that the time required for complete evacuation can exceed that which is considered necessary for the safe egress of all occupants. Studies of the "chimney effect" and observations of smoke movement in actual fires have shown that present measures for containing a fire on any one storey will not usually prevent the movement of smoke through vertical shafts to the upper floors of a high building. This situation may make the operation of elevators unsafe in a fire emergency. Occupants of high buildings, and particularly those on upper storeys, may therefore be faced with severe smoke conditions from fires occurring in storeys below them, before their own evacuation is possible.
>
> The Associate Committee is aware of this serious problem. It has drafted new provisions for the National Building Code to increase the safety of high buildings. This Subsection now indicates essential requirements for this purpose.

¶ 65 The Note continued by stating that additional important provisions that relate to the control of smoke movement would be issued separately in the form of a special paper as they represented a departure from existing design practice, and by inviting comments on the paper. The important point for our purposes is that the Note states that the new Subsection "now indicates essential requirements" for high-rise safety. One of these essential requirements, found in Sec. 3.3.4.2(4) called for SCDs on doors between suites and corridors in apartment buildings.

¶ 66 One of the most significant events in the business of operating high-rise apartment buildings in the dozen years before this fire was the publication of the Webber Report, referred to in the Axes defendants' submissions as noted above, and in evidence as part of Exhibit 13. It was a comprehensive examination of fire safety in high-rises. Judge Webber reviewed a number of fires in various kinds of high-rise buildings, including hotels, office and apartment buildings. He heard many expert witnesses, including senior officers of several of the biggest high-rise developer/managers in the country: Olympia and York, Oxford Group and Maysfield Property Management. He had the assistance of counsel from the major associations including the Urban Development Institute, Apartment Group; the Housing and Urban Development Association of Canada; the Metropolitan Toronto Apartment Builders Association and others. His report made clear the importance of the prevention of smoke movement throughout the remainder of the building from the room of origin. At page 165 he wrote:

> An open entrance door to the room or suite of fire origin provides an avenue for the spread of fire and smoke throughout the building. A door closer, if properly installed and maintained, ensures that the door will be closed after the occupants leave the room or suite.
>
> The disastrous results that can occur when doors are left open were evident in the fire at 88 Bloor Street East, described in Chapter 3, and in the Westchase Hilton Hotel in Houston, Texas, described in Chapter 4.
>
> The Ontario Housing Corporation statistics reinforce the need to have self-closing devices on these doors. In 1981, OHC statistics indicated that 72 of 93 people leaving suites of fire

origin in high-rise apartment buildings left the door open.

¶ 67 Judge Webber's Recommendation 10.1 was that each suite entrance door in a high-rise apartment should be equipped with a self-closing device. This was so important that it was recommended not only for future buildings, but for compulsory retrofit in existing buildings.

¶ 68 This important Report ought to have been in the stock of knowledge of every informed Ontario high-rise owner. It would certainly have been known to Olympia and York, whose Senior Vice-President, Property Administration of Office Buildings, Mr. Gringorten, gave evidence to Judge Webber on April 6 and 12, 1983. In 1986 Olympia and York became a partner in the purchase of the complex of which 2 Forest Laneway was a part. It is not clear to what extent it remained in the ownership group by 1995. Regardless of any role of Olympia and York, it is not conceivable that the senior managers engaged by Axes/Tandem would not have been aware of the risks disclosed by the Webber report. Indeed, as persons in the business, it was surely part of their job to know about the proposals that emanated from the Webber Report and led to the Retrofit legislation that came into force in stages in 1990-94. As counsel for the plaintiffs put it in opening, "the knowledge necessary to protect the occupants was public knowledge".

¶ 69 The issue raised by the plaintiffs is this: against this background, was it taking reasonable care for the safety of their tenants for Axes/Tandem to do nothing from 1986 to 1995 to rectify the danger created by the absence of SCDs on the suite doors until they were forced to do so by legislation, and even then to seek an extension of time for this work?

Reasonable Care is a Proactive Duty:

¶ 70 In their written submissions, the Axes defendants wrote:

> - page 6: Axes/Tandem purchased the property in 1988, and were not aware that door closures on suite doors may have been required in 1974 when the building was constructed.
> - page 7: Axes/Tandem, who were not the original owners that constructed the building in 1974, should not be criticized for failing to know that door closures had been required by Bylaw 22000 if that be the decision of this Court at the
> - page 14: It is respectfully submitted that at 2 Forest Laneway, the suite door of Apartment 509 complied with Bylaw 22000, the Building Code and the new Fire Code, with the sole exception of the absence of a door closure, should this Court find that Bylaw 22000 required their presence.

¶ 71 These submissions, although pertinent to the dispute between the City and Axes/Tandem over liability if Bylaw 22000 did require suite door SCDs in 1974, are not germane to an examination of Axes/Tandem's liability under the theory advanced by the plaintiffs in this part of their submissions. That theory proceeds upon the basis that Axes/Tandem owed its tenants a duty whether or not Bylaw 22000 required such SCDs. The issue is what ought Axes/Tandem, as reasonable high-rise owner/operators, to have known about the risk of not having SCDs and what ought they to have done when they learned of those dangers. Their position was stated as follows:

> There should be no obligation on the part of Axes/Tandem to make inquiries as to the absence of door closures on suite doors when a building permit had been issued in 1974, evidencing compliance with the Building Bylaws which plans and specifications showed no door closures being installed on the suite doors.
> (page 15) The retrofit procedure proposed in 1994 re-affirmed the state of mind of Axes/Tandem that individual suite door closers had not been necessary under Bylaw 22000.

¶ 72 Axes/Tandem thus claim the right to ignore all developments in building safety since 1974 on the strength of the original Building Permit. They had, they say, no obligation to consider whether such developments indicated that what had been an acceptable situation in 1974 was no longer acceptable, but actually created a situation of danger to their tenants which could be rectified easily and with little expense. Even when the new Fire Code was enacted and their own engineers, SPG, told them they had to provide door closers for the suites, they postponed the work as long as the Code allowed by obtaining an extension of time to comply.

¶ 73 There was no evidence called of the state of mind of Axes/Tandem in 1994 or at any other time. There was no evidence brought to explain

what their thinking was about the Webber Report and its emphasis on the importance of preventing the spread of smoke as a life protection matter. The plaintiff's position on the public nature of the information needed to protect the occupants was known to Axes/Tandem and was reiterated by plaintiffs' counsel in opening the trial. There was no surprise; the Axes/Tandem defendants deliberately chose to call no evidence to explain their inaction. No one testified that they were unaware of the facts, or that they considered the matter and bona fide concluded there was no danger, or that their finances could not afford the $13,000 per building to install suite door SCDs. No one even testified that they ever considered By-Law 22000, never mind relied on it. They cannot complain if the Court draws the inference, as it does, that the available testimony would not have assisted their case because they would have had to admit that they knew of the danger and chose to ignore it as long as they could.

¶ 74 In Waldick v. Malcolm (1991), 83 D.L.R. (4th) 114 (S.C.C.) the defendant occupier of a farm house had salted the steps and the approach to the door on a wintry February day in rural Ontario. She had not, however, salted the driveway and parking area which was, as she knew, icy from a recent storm. The plaintiff was knowledgeable about the condition of the area, having traversed it carefully earlier, on arrival to visit the Malcolms. He went out to his car for some cigarettes and, while returning, slipped on the icy parking area, fell and fractured his skull. The defendant Roberta Malcolm testified that she had not considered it necessary or reasonable to salt or sand this area, and that few of the residents of the area, including the plaintiff himself, did so.

¶ 75 At trial, (61 O.R. (2d) 624), Austin J. followed the similar case of Preston v. Canadian Legion, Kingsway Branch No. 175 (1981), 123 D.L.R. (3d) 645 (Alta. C.A.). There the Court held that the Alberta statute, similar to our own, imposed an affirmative duty upon occupiers to take reasonable care for the safety of persons coming onto the premises, in place of the former common law position of liability for unusual dangers of which the occupier was aware. Austin J. held that the icy condition of the Malcolm's driveway was not unexpected but they did nothing to render it less dangerous. He rejected a lesser standard of care for rural areas and concluded:

> The question is, by doing nothing under these conditions, do the [Malcolms] meet the standard of care required of them under the Act? In my opinion they do not.

¶ 76 On appeal, the trial judgment was upheld: 70 O.R. (2d) 717. Blair J.A. approved of the decision in Preston, supra, rejected the lower standard for rural areas and the alleged local custom of not sanding driveways, and agreed that, by doing nothing, the Malcolms had breached the standard required by the Act.

¶ 77 In the Supreme Court the Malcolm's appeal was dismissed. Iacobucci J., for the Court considered the appellants' submission that the lower courts had wrongly failed to take into account the local custom of not sanding driveways. He found that the lower courts had in fact considered this local custom among the many factors that were relevant to what constituted reasonable care in all the circumstances. The burden of proof of such a custom was on the one asserting it, the Malcolms, and the evidence was such that the lower courts could reasonably conclude that the onus had not been met. He then pointed out that even with adequate evidence, such a local custom would not necessarily have prevailed. He referred to Prof. A. Linden's article Custom in Negligence Law (1968) 11 Can. Bar J. 151, where, at 154, the author notes that "tort courts have not abdicated their responsibility to evaluate customs, for negligent conduct cannot be countenanced, even when a large group is continually guilty of it." Iacobucci J. continued, at page 125: "In short, no amount of general community compliance will render negligent conduct 'reasonable in all the circumstances'." Farther on he added, after noting some authorities, "If, as the lower courts found, it is unreasonable to do absolutely nothing to one's driveway in the face of clearly treacherous conditions, it matters little that one's neighbours also act unreasonably. Presumably it is exactly this type of generalized negligence that the Act is meant to discourage."

¶ 78 Finally, at page 128, Iacobucci J. said:

> The goals of the Act are to promote, and indeed, require where circumstances warrant, positive action on the part of occupiers to make their premises reasonably safe.

¶ 79 This case is strong authority for the view that the Act requires a landlord/owner/occupier to be proactive in making its premises reasonably safe for those who use them. It is not enough to do nothing in the face of a known risk, even though it may well be that other owners in the same position may also be doing nothing until they are forced into action by legislation.

¶ 80 In Mortimer v. Cameron (1994), 111 D.L.R. (4th) 428 (Ont. C.A.) two party-goers engaged in some 'good-natured horseplay' during which they fell down some stairs striking the exterior wall of the stairwell with minimal force. Due to sub-standard construction, it gave way and the plaintiff broke his neck in the ensuing fall to the ground. The City of London had issued a Building Permit without due care and had failed in its duty to inspect the work for compliance. It was found liable. Of more interest to us at the moment, the landlord, whose predecessor had built the structure, was also found liable as an occupier under s. 3(1) of the Occupiers Liability Act.

¶ 81 The occupier, 'Stingray', acquired the building in 1979, seven years after the faulty wall was built. It submitted, paralleling the Axes submissions here, that it should have no liability for failing to correct defects which were not apparent to it and which would not have been apparent on a reasonable inspection. The court found no reason to interfere with the trial Judge's finding of liability on Stingray. At page 438, Robins J.A., for the Court, said:

> The trial judge correctly held that this company, as owner and occupier of the premises, was under an ongoing duty to inspect the enclosed stairway irrespective of any notification from its tenants of any problem relating thereto.

¶ 82 In my view, the law required Axes/Tandem to take positive action to make their premises reasonably safe in the circumstances which prevailed between 1986, when they first bought the premises, and 1995, when the fire occurred, notwithstanding the fact that they did not create the danger. During that period the publicly available information on the vital role played by suite door SCDs in preventing the spread of smoke throughout the whole building was so compelling that any reasonable landlord/occupier ought to have realized that their absence created a situation of danger to all the tenants in the entire building in the event of a fire in a suite. They had an ongoing obligation to review the safety of their building in the light of developments in fire safety. Given the great danger and the simple and inexpensive solution, reasonable care required prompt action; it was not 'reasonable care' in such circumstances for them to wait until legislation forced them to remove the danger.

Allegations relating to the Fire Plan and Tenant Education:

¶ 83 The Fire Plan for the building was submitted to and approved by the North York Fire Department in 1990. It called for inspections monthly of doors such as those leading to the stairwells. I have already noted the failure of Axes/Tandem to instruct the building Superintendents to do these and the absence of evidence that anyone else did them. Various tenants gave evidence that they received no training or information about what to do in case of fire as required in the Fire Plan. There were no fire drills even though called for every three months in the Fire Plan and the Fire Code.

¶ 84 As set out earlier in these reasons (Response of the Axes Defendants, supra) Axes/Tandem submitted that there was no evidence that failing to distribute the Fire Plan to tenants and to conduct regular fire drills caused or contributed to the injuries. So far as educating the tenants is concerned, the failure to conduct fire drills may be irrelevant as their participation was optional: Fire Plan, section 8, page 9. Nevertheless, the failure to hold drills and to distribute the information as to fire safety procedures indicates a lack of attention to fire safety procedures which seems to have extended to the training of the staff also as seen in the testimony of Mr. Broderick.

¶ 85 Axes/Tandem submitted that they had complied with the Fire plan in part by posting a sign as required by section 3, page 4 and shown in the photograph in evidence at Exhibit 1, tab 4. It instructed, in suitably large print, that on discovery of fire tenants should:

> Leave fire area immediately and close doors
>
> Pull fire alarm located by stairwell exit
>
> Dial 911. Ask for North York Fire Dept.
>
> Leave building via nearest exit
>
> DO NOT USE ELEVATORS
>
> Upon Hearing Fire Alarm
>
> Leave Building via nearest exit
>
> Take Apartment Key

CAUTION

If smoke is heavy in the corridor, it may be safer to stay in your apartment
Close door behind you, and place wet towel at base of door
Listen for instructions over P.A. system
If you encounter smoke in stairway use alternate exit REMAIN CALM

¶ 86 This sign was approved in the Fire Plan and Axes/Tandem cannot be criticized for its use. It neatly illustrates the dilemma referred to in the Webber Report as facing all occupants in a high-rise fire: Stay or Leave? In their submissions, Axes/Tandem refer to this dilemma and point out that only tenants who left their apartments were killed or injured. They further say that the plaintiffs were well aware of these instructions. This is all true, but it does not mean that the plaintiffs were somehow wrong to leave their apartment. The instructions twice state that one should leave the building by the nearest exit, which is exactly what the plaintiffs tried to do. The caution warns that if smoke is heavy in the corridor, it may be safer to stay. There remains a dependence upon the individual judgment of occupants facing stressful conditions they did not create. No legal comfort can be taken by Axes/Tandem if the plaintiffs chose an apparently reasonable, but ultimately disastrous course, as they did. Nevertheless, in my view, the evidence does not establish that better education of the tenants would have prevented the deaths and injuries that occurred.

¶ 87 It is evident from the Fire Plan that one of its major objectives is to see that the owner's staff are educated in their duties in case of fire. This is the main point of fire drills, for example. This educational duty was not carried out by Axes/Tandem. It was said that this lack of training led to the failure of the staff, on the morning of the fire, to communicate with the tenants via the voice communication system. Mr. Broderick arrived at the lobby of 2 Forest Laneway after the Fire Department was already there. On arrival he said he observed the annunciator panel in the open position and Mr. Macht already at work bringing the elevators to the ground floor. Mr. Broderick did not attempt to use the annunciator to communicate with the tenants because the firefighters were already there and they were trained to take over. Various tenants indicated they heard nothing that morning over the voice system, so it is fair to conclude that Mr. Macht also did not use it. However, it is not clear when he arrived, the firefighters may well have been there. In any event, it would be speculative to think that Mr. Macht would have advised people to remain in their suites when the instructions in the Fire plan were as has been outlined earlier, to leave the building by the nearest exit, but if there is smoke, it may be safer to stay in the suite. At the outset of the fire there was no reason for someone in the lobby to suspect that the smoke would spread as it did. I do not think that the failure of Axes/Tandem to train their personnel to use the annunciator was a causal factor in the deaths and injuries that took place.

Defective Roof Hatches:

¶ 88 There was evidence that the roof hatches above both stairwells were defective and failed to open automatically, as they were meant to do in the presence of smoke. Mr. Harpur's report at Exhibit 13, page 198 comments that opening the hatch would have increased the flow of smoke coming into the stair. The plaintiffs did not rely on these defects in their final argument.

Conclusion as to Axes/Tandem:

¶ 89 The negligence of Axes/Tandem, both in failing to maintain the 5th floor fire stair SCD and in failing to install suite door SCDs caused or contributed significantly to the injuries and deaths that occurred in the fire. The plaintiffs are entitled to judgment against the corporate Axes defendants.

Liability of the Officers, Directors and Employees of Axes/Tandem:

¶ 90 Although the plaintiffs pleaded that the defendants Alfredo DeGasperis, Paul Reid, Van Forbell, John Broderick and Robert Macht ought to be personally liable for the failures of Axes/Tandem, the issue was not pressed at trial. No submissions were made to establish the factual or legal basis upon which such a finding could be made. Mr. Macht failed to appear to be examined as a witness under Rule 53.07 and judgment was sought against him on that basis. Rule 53.07(7) provides that where a person required to testify under the Rule does not attend, the Court may grant judgment or make such other order as is just against the person. The issues upon which Mr. Macht could have given evidence would have been those on which Mr. Broderick did testify and have essentially been found against Axes/Tandem. There is no indication that the lack of Mr. Macht's evidence hampered the plaintiffs' case in any significant way. There is no indication that he acted deliberately; he is said to have disappeared, but it

was not shown that he did so to avoid testifying. In my view, Mr. Macht should not be treated differently from the other superintendent, Mr. Broderick, against whom the plaintiffs did not press for judgment. The action will be dismissed as against Messrs. De Gasperis, Reid, Van Forbell, Broderick and Macht. As they all appear to have been defended by Axes/Tandem, the dismissal will be without costs.

Liability of North York, Part 1: Alleged Failure to Enforce By-Law 22000:

¶ 91 The plaintiffs say that North York was negligent in three different ways, each of which caused or contributed to their injuries: the city failed to enforce its own Building Bylaw; acted negligently in dealing with Axes application to extend the time for compliance with the retrofit; and, at the fire scene, failed to warn the tenants to stay in their suites. This section of my reasons deals with the first of these allegations.

¶ 92 Bylaw 22000 was enacted in May 1968 and, as amended to March, 1971, governed the issuance of building permits and the approval of building plans in 1974 when the application for 2 Forest Laneway was processed by North York. The plans were approved without any provision for SCDs on suite doors. The plaintiffs say and the defendants deny that SCDs were required on those doors.

¶ 93 Specifically, the plaintiffs say, the building as approved for construction in 1974 and as constructed in 1975, failed to comply with s. 3.1.3.6(15) of By-Law 22000 which required that there be self-closing devices on the suite doors. The plans examiner failed in his duty of care to require compliance with the By-law prior to approving the plans. The building inspector failed in his duty of care to require that such self closing devices be installed in the building;

¶ 94 Certain extracts from By-Law 22000 are pertinent:

> Section 1.2(a): When a building is built, ... this By-law shall apply to the ... construction of the building ...
> Section 1.5 RESPONSIBILITY OF THE OWNER: S. 1.5.1: Neither the granting of a permit, nor the approval of drawings and specifications, nor the inspections made by the Building Commissioner ... during the erection of a building shall in any way relieve the owner ... from full responsibility of carrying out the work in strict accordance with the provisions of this by-law ...
>
> Section 1.6: The Building Commissioner shall:
>
> 1.6.1 Examine all applications for permission to do work in connection with building;
> 1.6.3 If the matters mentioned in any application for a permit or if the drawings, specifications or block plan or survey submitted with the application indicate to the Building Commissioner that the work proposed to be done will not comply in all respects with the provisions of this By-law and all applicable governmental regulations, refuse to issue a permit therefore and no permit shall be issued until the application, drawings, specifications and the block plan are made to conform to the requirements of this By-law and all applicable governmental regulations; ...
>
> 1.6.5 Enforce this By-law;
>
> Section 1.11: No person shall occupy or permit to be occupied any building ... which has been erected ... until a Certificate of Compliance has been obtained from the Building Commissioner, certifying that the work has been completed in accordance with this By-law ... and the approved plans in respect of which the permit was issued."

¶ 95 Part 1A of the By-law is the Definition Section. The following are relevant:

> APARTMENT HOUSE shall mean a building used for the purpose of providing three or more separate dwelling units other than a triplex.
> APPROVED shall mean approved of by the Building Commissioner, unless specifically mentioned otherwise.
> MEANS OF EGRESS shall mean a doorway, hallway, corridor, lobby, stair, ramp or other facility or combination thereof, provided for the escape of persons from a building, floor area, or room to a public thoroughfare or other approved open space. Means of egress include exits and access to exits.

NON-COMBUSTIBLE, as applied to a building material shall mean that the material is classed as non-combustible when tested by a standard method of fire test as prescribed herein. (Section 3.1.3.1.)
OCCUPANCY shall mean the use or intended use of a building or structure or part thereof for the shelter or support of persons, animals or property.

¶ 96 Part 2 is entitled MEANS OF EGRESS.

Section 2.3.12.5: Doors to Be Kept Closed:

Every exit door that is normally required to be kept closed shall be provided with an approved [by the Building Commissioner] self closing mechanism, and shall not at any time be secured in an open position.

¶ 97 Part 3 of the By-law is titled "USE AND OCCUPANCY". The Introduction to this Part states:

This part shall apply to all buildings other than houses hereafter erected, enlarged or altered and sets forth minimum requirements for safety for such buildings, taking into consideration the occupancy, the type of construction, the exterior exposure and the accessibility of the building to fire fighting facilities and equipment.
The design and location of means of egress shall be in accordance with Part 2 of this By-law.

¶ 98 By s. 3.1.2.4, apartment buildings such as 2 Forest Laneway were classified as Group C, Division 2, buildings used or intended for use for Residential Occupancy.

¶ 99 Section 3.1.3.6 is entitled Fire Separations. A Fire Separation is a barrier to the spread of fire and smoke in the form of construction, i.e. a wall, having a fire rating and fire rated closures (doors) or complying with ss. 3. 1.3.6(2) to 3.1.3.6(16). Section 3.1.3.6(15) states:

Except as provided in Section 3.1.3.6(16)* all doors in interior fire separations shall have approved self closing devices which, when the door is opened, will return the door to the closed position. Such devices on exit doors shall not reduce the headroom below that required for exit doors in Part 2 of this By-law.

* Section 3.1.3.6(16) has no application to this case.

¶ 100 Section 3.3 is entitled REQUIREMENTS FOR FIRE SAFETY WITHIN FLOOR AREAS. Section 3.3.4 sets out Special Occupancy Requirements for Floor Areas Intended for Residential Occupancy:

Section 3.3.4.1: Separation of Rooms or Suites, states:
1 ... suites in ... apartment houses ... shall be separated from adjacent corridors and suites by not less than

(a) a one hour fire separation in buildings required by this By-law to be of fire resistive construction [which this Building was by virtue of s. 3.2.1.27] and (b) a 3/4 hour fire separation in all other buildings.

Section 3.3.4.1(2): Doors from rooms or suites to corridors may be solid core wood doors not less than 1 3/4 inch thick.

¶ 101 The plaintiffs submit that SCDs are required under Bylaw 22000 because: suites must be separated from adjacent corridors by a one-hour fire separation (3.3.4.1); which may have a door of solid core wood not less than 1 3/4 inch thick (3.3.4.1(2)); and any door in such an interior fire separation must have an approved SCD (3.1.3.6(15)). I agree with this analysis.

¶ 102 The defendant North York, whose submissions the Axes/Tandem defendants adopt, submitted that the Bylaw did not require SCDs on the suite doors. In support of its submissions, it called two witnesses, Mr. Rick Mori and Mr. Yaman Uzumeri. Mr. Uzumeri was not involved in the review of the 2 Forest Laneway plans in 1974, and Mr. Mori was involved only in the structural aspects, although each was experienced in the field of plans examination and with Bylaw 22000. The actual plans examiner, if still living, would have been some 93 years old and could not be called to explain what he had done. Mr. Forbes sought to call these men, not as experts, but as lay witnesses to testify as to the background facts so as to explain why the examiner might not have overruled the architect and called

for closers on the suite doors. Objection was taken to the relevance of any of this. Neither man was involved in the approval of the relevant part of the plans and their evidence would at best be speculation. In the end, I heard the evidence although I felt that the plaintiffs had the better side of the argument, because it seemed more practical to put it on the record and argue about its relevance and weight afterwards.

¶ 103 Mr. Uzumeri testified that after the fire he asked Mr. Mori to research why there were no SCDs on the suite doors, partly for his own information and also because a request came from the OFM for the same information. Mr. Mori's explanation dated February 7, 1995, became Ex. 56. He agreed with counsel that when he wrote it he was aware that the OFM believed that SCDs could have confined the fire to the suite of origin. Mr. Mori's evidence in large measure turned out to be speculation as to how the examiner might have reached the conclusion that SCDs were not required. I thought the explanation self-serving and contrived.

¶ 104 Mr. Mori testified that the National Building Code, 1965, was used as an aid to interpret the Building Bylaw where there was doubt because, in general, the NBC 1965 had been used as a model for Bylaw 22000. The NBC 1965 expressly provided that suite doors in apartment buildings did not require closers. He said that therefore, those who wrote Bylaw 22000 would 'obviously' have had the same intent. In my view, this is a stunning non sequitur. Section 3.1.3.6(15) demonstrates clearly the opposite intent: all doors in interior fire separations are to have SCDs. Just because NBC 1965 was the model is not a reason to ignore clear language. Indeed, in cross-examination Mr. Mori admitted that the absence in the Bylaw of the phrase 'and closers need not be provided' found in NBC 1965 could fairly lead to the conclusion that the Bylaw drafters intended closers to be installed.

¶ 105 Mr. Mori sought to demonstrate a latent ambiguity in Bylaw 22000 by referring to the permission for suite doors to be solid wood core at least 1 3/4 inches thick. Such doors, he said, had no fire rating and it was not logical to require such doors to have closers. Again, this turns logic on its head. The two requirements address different risks. The fire rating of the door relates to how long it and its latch will stand up to flame; the closers refer to the risk that the door will be open and flame and smoke will spread uninhibited by any door at all. Even the highest fire rated door will not prevent the spread of smoke and flame if it is standing open. As well, because a door is unrated does not mean it offers no resistance to the spread of fire and smoke. Evidence from Mr. Harpur of the OFM showed that the unrated door on suite 509 would have represented a 'useful barrier against the spread of fire and smoke' if it had been closed, and the unrated door within the suite kept the fire out of the adjacent room. The test conducted by U.L.C. for Mr. Harpur after the fire on a typical suite door showed that it took 8 minutes for an 11 mm. (0.433 inches) gap to appear and 13 minutes for a burn through hole of some 60 mm (2.36 inches) in height along the lock side of the door to develop. At 18 minutes it was noted that the hole had increased in size, but the new dimensions were not given. At 20 minutes the fire test was ended with Mr. Harpur noting that the door remained essentially intact and in place and a useful barrier to the spread of the fire and smoke.

¶ 106 Mr. Mori's theory that the requirement for SCDs could not logically apply where the door in question had no fire rating was further undermined by the fact, pointed out in cross-examination, that NBC 1965 contained a provision that up to a one-hour fire separation requirement could be waived if a door opening was closed by a solid wood core door 1 3/4 inches thick. Such a door, at the time, was an unrated door, but this provision recognized that such a door had fire resistance value.

¶ 107 Mr. Mori's theory of ambiguity was based on the view that there was no point in requiring SCDs on a door with no fire rating. For the reasons noted, I reject that theory as not in accordance with logic or the evidence before me.

¶ 108 Mr. Mori's memorandum also refers to the OFM 1971 Fire Safety Design Standard. It stated that all fire doors required SCDs, but Mr. Mori referred to an exemption for school classroom doors which he speculated was based on those doors not having a fire rating. Therefore the same situation in apartments would not require SCDs. This is pure speculation; he did not know the basis for the OFM exemption for classrooms.

¶ 109 On its face Bylaw 22000 requires SCDs on suite doors and any other conclusion can only be reached by going back to NBC 1965 and concluding that the drafters of the bylaw did not mean what they said and really intended to follow NBC 1965. Mr. Mori himself admitted at the end of his cross-examination, that this was so. When it was put to him that the drafters of the Bylaw could have included the phrase that closers 'need not be provided', but did not, Mr. Mori suggested that they might have taken it for granted, a blatant piece of self-serving speculation. Only when pressed

did he admit that it would be a fair reading that the drafters intended closers to be provided.

¶ 110 In 1970 a new edition of the NBC was issued. The copy in the material before me is from the second printing with corrections to April 1, 1971 and was received at the Great Library at Osgoode Hall in February, 1972, and so the first printing of the new edition would have been in circulation well before that time. Section 3.3.1 contains requirements applying to all floor areas and by 3.3.3.5.(1) requires that doors acting as closures in fire separations be equipped with SCDs. Section 3.3.4 applies specifically to areas intended for use for residential occupancy and by 3.3.4.2(4) requires that doors between corridors and suites in Group C buildings, which includes apartment buildings, be provided with SCDs. Mr. Mori at first speculated that perhaps this change was not known by 1974, but conceded that he would have expected it to be published and available by 1974. As I have noted, the dates indicate it was available long before that.

¶ 111 Once the NBC 1970 came out, it seems to me that any temptation on the part of plans examiners applying the Bylaw to think that the drafters of Bylaw 22000 did not mean what they wrote must have disappeared, if it ever existed. Indeed, there was no actual evidence that anyone in the department held any such view at the time.

¶ 112 A series of letters was put to Mr. Mori in cross-examination relating to an opinion he gave to Mr. Holden, an investigator employed by counsel for the plaintiffs, as to the issue of door closers and Bylaw 22000. The first was a letter dated August 9, 2000, summarizing the conversation earlier that day between Messrs. Holden and Mori. The letter states, and Mr. Mori agreed, that during that conversation Mr. Mori got out Bylaw 22000 and reviewed it. The letter states that Mr. Mori advised Mr. Holden that it required SCDs on all suite doors and that, although some buildings had exemptions from this requirement, apartments did not. Mr. Mori agreed that he 'probably' so advised Mr. Holden. Mr. Mori said that he received Mr. Holden's confirming letter and looked at it and filed it away. He did not contact Mr. Holden to correct any of it. On November 29, 2000 Mr. Mori was subpoenaed for this trial.

¶ 113 Early in January, 2001, Mr. Mori met with counsel for North York, went over Mr. Holden's letter and 'realized the conclusion that someone could reach' based on it. On January 4, 2001, he wrote to Mr. Holden to 'clarify' some issues referred to in the latter's letter by introducing some of the arguments mentioned in the 1995 memorandum. Mr. Holden responded on January 6, 2001 reiterating some of the key points discussed as he recalled them from his notes, particularly that Mr. Mori had confirmed that 2 Forest Laneway was not exempt from the SCD requirement, and had confirmed that he had enough information to give Mr. Holden that opinion. Mr. Mori was far from impressive when testifying about these letters.

¶ 114 Mr. Holden gave evidence supporting the accuracy of his description of the interview and Mr. Mori's statement that SCDs were called for. He denied that there was any discussion of fire rated doors or of dwelling unit doors being exempted. He denied the suggestion in Mr. Mori's letter that his opinion as to the requirement for SCDs had been based on to-day's standards rather than those prevailing at the time of construction. He was a careful and impressive witness and I prefer his evidence as to the conversation to Mr. Mori's. I find that Mr. Mori did indeed tell Mr. Holden in the summer of 2000, that Bylaw 22000 called for SCDs at 2 Forest Laneway in 1974.

¶ 115 Mr. Uzumeri's evidence as to the background of Bylaw 22000 was similar to Mr. Mori's. He had been the secretary of the Toronto Area Building Code Committee which had prepared a model bylaw based on NBC 1965 for adoption by Toronto area municipalities. He had not been able to locate any minutes of the Committee. He had no personal knowledge of how the Bylaw was interpreted in 1974 with reference to SCDs on apartment suite doors. He generally supported Mr. Mori's theory of how the Bylaw might have been interpreted to allow construction of 2 Forest Laneway without SCDs on suite doors. Like Mr. Mori, his evidence on this point was speculation.

¶ 116 I do not accept Mr. Mori's reasoning, nor Mr. Uzumeri's support of it. There is no ambiguity in the relevant sections of Bylaw 22000 and no need to go to NBC 1965 or other external aids to interpret the plain words. I find that Bylaw 22000 required that 2 Forest Laneway be equipped with SCDs on all suite doors. In approving the plans and issuing the permit without such SCDs, North York failed to correctly interpret and enforce its own Bylaw.

¶ 117 By not enforcing this part of Bylaw 22000, North York caused or contributed significantly to the deaths and injuries, including the injuries of

the plaintiffs, which occurred in the fire of January 6, 1995. If the suite door to 509 had been closed, it would have at least been a useful barrier against the spread of the fire and smoke; indeed, Mr. Hiscott and Mr. Silvestri felt that they would have been confined to 509 itself. Had that been the case, there would likely have been no injuries or fatalities from smoke. The tests done for Mr. Harpur do not, of course, precisely duplicate the actual conditions, but the results suggest that the smoke would have been entirely confined to suite 509 for at least 8 to 10 minutes and very significantly restrained thereafter. Given the speed with which the smoke spread through the open door and into the halls, and the relatively short time the tenants had to evacuate, even that time would have been significant. Again, confining the fire to 509 would have meant that there would have been no thick black smoke from the hall carpeting adding to the dangers to the tenants.

¶ 118 Was the failure to correctly interpret and enforce its Bylaw an act of negligence on the part of North York? It was not argued that the decision not to require SCDs either in the Bylaw, as the City interprets it, or in the case of 2 Forest Laneway itself, was in any sense a policy decision attracting special legal considerations. The case was argued by North York on the basis that it owed a duty of care in the administration of the Bylaw to those likely to be affected, including the plaintiffs.

¶ 119 A municipality is not required to interpret the applicable building code to perfection and the mere misinterpretation of the applicable code is not, in and of itself, negligence. In Manolakos v. Vernon (City), [1989] 2 S.C.R. 1259, the Supreme Court held that a municipality "is only called upon to show reasonable care in the exercise of its powers of inspection." and at page 1268 that an owner "... should be entitled to rely on the City to exercise reasonable care to ensure that all construction is built according to the standards set out in the bylaws."

¶ 120 In Beutel Goodman Real Estate Group Inc. v. Halifax (City) (1998), 169 N.S.R. (2d) 248 (S.C.), the Court held that the plaintiff had the onus of showing that the City did not act with reasonable care when erroneously interpreting the NBC. In that case the plans examiner had not even read the Code and agreed that if he had, he would have known his interpretation was incorrect. The City claimed to have relied upon an interpretation bulletin and the City's interpretation was in direct contradiction of the plain meaning. The Court rejected the submission that only if the City had been made aware that its interpretation was being seriously questioned could it be argued that its interpretation showed a lack of reasonable care on its part. The evidence amounted to lack of reasonable care.

¶ 121 In Beutel the Court had the benefit of the evidence of the actual examiners who described what they had done. In the present case, the Court does not have any direct evidence as to what care was taken to ensure that the Bylaw was correctly interpreted. The evidence of Messrs. Mori and Uzumeri was not about what the examiner had done. Rather it was speculation created after the fire, directed to trying to explain how he might have reached a conclusion directly contrary to the plain language of the Bylaw. Neither of them testified that their interpretation was in fact held by anyone in the Building Department when this work was done.

¶ 122 Messrs. Mori and Uzumeri testified there was an interpretation book in which the department recorded interpretations of difficult sections of the Bylaw. There was no evidence that this issue and interpretation was in the book. Further, Mr. Mori testified he helped the examiner with the structural plans. Thus, he was active in the department at the time, but gave no testimony that this matter was raised. If the examiner had any doubts about the interpretation and had acted reasonably, he would have raised it in the department and an interpretation would have resulted. No reasonable examiner would follow the path outlined by Mr. Mori without checking it out with his superiors, given that it was a life safety matter and the result was to reverse a plain language requirement. The evidence simply does not support the speculation that the examiner went through the process of reasoning theorized by Mr. Mori.

¶ 123 In discharging their onus, the plaintiffs cannot be expected to delve into the City's bureaucracy; they fulfill their obligation by demonstrating the unreasonableness of the interpretation. In the speculative and illogical analysis of Mr. Mori and Mr. Uzumeri, North York has not produced a reasonable explanation for the failure of its examiner to require what the by-law required.

¶ 124 It was submitted that, in assessing the reasonableness of the City's interpretation of Bylaw 22000, regard ought to be had for the principles set out in the decision of the B.C. Court of Appeal in Virdi v. Inland Feeders Ltd., [1982] 1 W.W.R 555, (B.C.C.A). In that case the Director of Planning gave incorrect information as to permitted uses, resulting in damage to the plaintiff. The trial judge held while the Director of Planning misinterpreted

the bylaw, he had acted in good faith and not carelessly or imprudently. He did not reach a conclusion which would be unacceptable to any skilled professional person. The Court held that the opinion he expressed, while incorrect, was one which could well have been made by the most competent of lawyers or judges. He was mistaken, but the conclusion which he reached was open to any skilled person in his field of endeavour.

¶ 125 Notwithstanding these findings, the trial judge found the municipality liable, [1980] 5 W.W.R. 346, but the Court of Appeal reversed the decision, holding that although municipal officers are required to be careful, skillful and reasonably competent, they will not be held liable to compensate anyone merely because they are wrong in their representations. The Court of Appeal refused to impose a standard of liability on municipal officers that would not be imposed on lawyers, accountants or bankers or even doctors, whose opinions may be the basis for life or death decisions.

¶ 126 It was further submitted that where there are two bodies of professional opinion, equally competent, one of which supports a decision as being reasonable, a defendant is justified in relying on that one. Although a Court may prefer one body of opinion to the other this is not the basis for a conclusion that there had been negligence on the part of the defendant: Maynard v. West Midlands Regional Health Authority, [1985] 1 All E.R. 635 (H.L.).

¶ 127 I have no difficulty in accepting the principles of these two cases, but the facts of this case are very different. Here there are no contending bodies of professional opinion, one of which supports the decision reached by the plans examiner. The evidence of Messrs. Mori and Uzumeri does not demonstrate that anyone in the department held that opinion in 1974 or at any other time. The examiner cannot be exculpated on the theory that he chose between two bodies of competent opinion when there is no evidence that he did so and no evidence of the existence of any such bodies. Similarly, I cannot say, as the Trial Judge did in Virdi, that the decision was one which could have been made by the most highly skilled persons in the profession. On its face, that is not so in this case.

¶ 128 The essence of this aspect of the case is that Bylaw 22000 called for SCDs on all interior fire separation doors in plain language. The plans examiner failed to require them in this building. If he had a problem with the requirement, he acted unreasonably in failing to take it up with his superiors and obtain an interpretation. That is enough for liability. By way of defence, North York produced no reasonable explanation for how this could have happened if their employee had exercised reasonable care. This was a life safety matter whose importance was well known in the industry; the National Building Code had been changed four years earlier to require these safety devices and the Bylaw itself had required them since it was enacted in 1968. It was utterly foreseeable that failure to require these devices would, in the case of fire, place the health and lives of the occupants at risk.

¶ 129 Failure to require the SCDs was an act of negligence for which North York is liable.

Liability of North York, Part 2: Granting the Retrofit Extension:

¶ 130 In the 1980s Ontario had a program of compulsory up-grading or "retro-fitting" of older buildings to bring them into compliance with more modern Building Codes. Types of buildings were brought under this program over a period of years, with the types most vulnerable to disastrous fires such as places of assembly and rooming houses, for example, being covered first. High-rise buildings were brought into the program by legislation enacted in 1992. There was a two year period for compliance and a possible extension for two additional years. The Axes/Tandem defendants, as owners of 2 Forest Laneway applied for that extension in 1994 and received it. The plaintiffs say that the defendants were not entitled to the extension and were granted it only because Mr. Cleary, North York's official in charge of deciding on applications for the extension, was unsuited to the job and acted negligently.

¶ 131 The statutory framework for the application for an extension in 1994 starts with Regulation 454/90 (the "1990 Fire Code"), enacted under the Fire Marshal's Act, s. 19. It contains Part 9, the "Retrofit", requiring mandatory upgrading of existing buildings not already in compliance. Section 9.1 gave an owner 2 years to comply, but permitted an application to the Chief Fire Official for an extension of up to 2 more years. The legislation did not set out any criteria upon which the extension application was to be judged.

¶ 132 The Chief Fire Official of North York delegated the responsibility for review of extension applications to Mr. Cleary who had been a Fire Protection Engineer with North York since 1990. He had spent most of his time in 1991 administering the retrofit program for rooming houses, and in

late 1992, after an interval studying "911" response times, he was assigned to administering the retrofit program for residential uses. He was solely responsible for dealing with extension requests in 1993-6. He was aware that the purpose of the retrofit legislation was to achieve minimum life safety standards. He handled some 670 extension applications of which 240 were for high-rise buildings. Of the 240, he granted about 100. It is clear that, despite the pressure of numbers, he did not merely 'rubber stamp' these applications.

¶ 133 Mr. Cleary was a chemical engineer and had no training or experience in reading or analyzing financial statements apart from a memory of possibly taking an introductory course in accounting at University. He said that in assessing applications he relied on the October, 1992 OFM Commentary on Changes to the Ontario Fire Code which included this passage:

> The owner may apply for up to two additional years to October, 1996. The request for an extension must be based on sound financial or logistical reasons and be accompanied by a schedule for completion of the required work.

¶ 134 In assessing the expectations of the Legislature as to the degree of investigation required in support of an extension application, it is important to note section 9.1.3.2.(3) which requires the Chief Fire Official to grant or refuse the extension within 10 days of receipt of the application. While that timetable was not met in the present instance, the shortness of the period indicates that a close and critical examination of the financial situation of applicants cannot have been expected. Mr. Cleary testified that he did not consider or evaluate the relative life safety impact of work items listed in extension requests. His rule was if the owner was losing money, any expense was a hardship. He did not believe at the time that he had any discretion to grant an extension less than two years, if two years was sought by the owner.

¶ 135 Later, in the fall of 1994, a more detailed and updated document was sent out by the OFM for the guidance of Chief Fire officials in evaluating requests for extensions. Mr. Cleary thought that it was radically different from the Commentary and changed the criteria. He did not alter his approach as he felt he had evaluated many requests on the Commentary approach and it would be unfair to alter the approach. He had not received this document when he granted the extension for 2 Forest Laneway. The entire Commentary was not in evidence, so comparison is not possible, but he said the new document laid some emphasis on considering the life safety implications and weighing them against the capacity of the owner to undertake the work. It seems likely that the emphasis on weighing the life safety aspects was at least one of the ways in which the new document seemed to Mr. Cleary to be radically different from the Commentary.

¶ 136 The plaintiffs say that the appointment of Cleary, a chemical engineer, unqualified and untrained in analyzing financial statements; the manner in which he conducted the task assigned to him; and his use of the criteria he himself set and relied upon, constituted negligence. To assess this allegation, I turn to the facts relating to the granting of the extension for 2 Forest Laneway itself.

¶ 137 In February 1994 SPG prepared a document entitled Fire and Life Safety Study for 2 Forest Laneway. This study was forwarded to Mr. Cleary under cover letter dated March 7, 1994, which stated that the study was prepared for the "owners Axes Investments Inc.". The letter stated:

> We request you to grant the owners a two year extension in time for compliance with Ontario Regulation 627/92 under the Fire Marshal's Act.

¶ 138 This Report was one of a number of applications submitted by SPG covering approximately 20 buildings. Mr. Cleary examined two reports in detail and concluded that the SPG reports were more than was needed for an extension application, and should have been differently formatted. He wrote back to SPG on July 8, 1994 regarding buildings at 10 and 20 Sunrise. He said he may have glanced at the Report for 2 Forest Laneway, but did not read it in detail. He wrote:

> "Based on the number of deficiencies in this report [the Sunrise Report] and in conjunction with cursory reviews of some of the other reports submitted by your company that show that they appear to be similar, we are returning the reports [numbering 20] for the following locations [including 2 Forest Laneway]".

¶ 139 Mr. Cleary went on to advise SPG what information was to be included in the application in order for him to grant the extension. He

developed this list of information, set out below, on his own and did not review it with any more senior people in the Fire Department.

a) The number of storeys in the building (so he could know if there were more than or less than 6 storeys);
b) The approximate cost of the retrofit upgrades;
c) Basic income and expense information for the building that show the retrofit costs are a hardship;
d) The specific length of the extension being requested;
e) The proposed order in which the retrofit upgrades will be performed.

¶ 140 SPG replied on July 29, 1994 and submitted "... the following information for the building ... which will show that the retrofit costs are a hardship to the Corporation." SPG requested an extension of time of two years, the maximum permitted. The total cost of the upgrades was $146,000. SPG requested an extension until October, 1995 to, inter alia:

> "restore damaged doors, frames, hardware, including door closers, garbage chute intakes, etc".

and an extension until October, 1996, inter alia, to

> "... supply and install ULC list door self closure [sic] devices for suites".

¶ 141 By letter dated September 29, 1994, Mr. Cleary granted the request by SPG to extend the deadline of compliance with the retrofit for two years to October 9, 1996. Identical extensions were granted for 4 and 6 Forest Laneway. Prior to doing so, he examined the financial and other information sent by SPG in support of the request.

¶ 142 The financial statements for the Forest Laneway Co-Tenancy for the year ending December 31, 1993, with comparative figures for 1992, which were before Mr. Cleary, are likewise in evidence. He concluded that they showed that the buildings had lost millions of dollars on their operations and qualified for the extension on financial hardship grounds. On cross-examination, it was put to him that the total cost of the retrofit was $146,000 and the Co-Tenancy had some $487,000 in the Bank at year-end 1993, up almost $21,000 from 1992. In response, he observed that this was money in the bank and he would not have assumed it was available as it might have been earmarked; he had looked at the operational bottom line. In the course of this answer, he said that he did not know how the finances of apartment buildings worked. This answer was stressed by the plaintiffs in their submissions as demonstrating the unsuitability of Mr. Cleary for the job. While he may not have been the best qualified person, further consideration of the financial statements shows that he was not far off the mark. They do show serious losses on operations, even after excluding non-cash items.

¶ 143 For the year ending December 31, 1993, the three buildings showed a loss on operations of $3.73 million (1992 $3.47 million). Removing the non-cash items, there was a loss of $1.94 million (1992 $2.28 million). The members' capital dropped from $2.8 million to $.47 million despite the injection of $1.3 million by two of the partners. With expenses to meet of just under $15 million and revenues of $11.2 million, one can see that the float of some $480,000 in the bank would be required for operational purposes. I also observe that the notes to the financial statement reveal that some of the mortgage interest was being deferred under an agreement with the mortgagee and was being added to the principal. There are thus several important indicators that these buildings were not in good health financially.

¶ 144 Mr. Cleary was also cross-examined about the fact that the financial statement was for an entity identified as Forest Laneway Co-Tenancy and he did not know what a co-tenancy was, nor did he ask anyone; that he did not make any inquiry as to the capability of the members of the co-tenancy to make advances to fund the retrofit programme, indeed he did not know who the members were. As noted, the financial statement reveals that the members had already injected substantial capital into the project in 1993 to cover the losses. Mr. Cleary also testified on cross-examination that he made no attempt to evaluate the reasonableness of the costs estimated for the upgrades by SPG. He stated there were three reasons for this: he was not a contractor, conversations with contractors led him to understand that market prices were variable and that there were time limitations, although these last were not the major problem. Here again, it seems to me that the scope of inquiry being pressed for by the plaintiffs in asking these questions exceeds the scope contemplated by a legislative scheme that gives the decision maker 10 days to make the decision.

¶ 145 In my view, the evidence reveals a sufficient basis for Mr. Cleary's decision that there were financial reasons supporting the granting of the extension.

¶ 146 Mr. Cleary was closely cross-examined on the dangers of leaving these buildings without SCDs for up to another two years. He acknowledged that he knew that heat and smoke are two products of combustion; that in high-rise fires, smoke is the primary cause of injuries and death; that he was aware that a feature of fires in high-rise buildings is the stack effect, and the consequent migration of smoke; that in 1994 he knew what a self closing device was, that its purpose was to return the door to the closed position and that keeping a door to a suite in the closed position was "an important part of fire safety." Mr. Cleary also testified that he knew that the information from SPG that many doors that had self closing devices did not close properly was an important matter of fire safety. This was not a matter of retrofit but of building maintenance, and on its face a breach of the Fire Code. Mr. Cleary said he did not refer these Fire Code breaches to the Fire Prevention Division of the Fire Department, the branch responsible for the enforcement of the Fire Code, because he assumed the owners would already have addressed them. No evidence was brought as to what would have happened if he had done so, such as the practices of the branch, the likely time lapse before they took action, etc. There is no basis in the evidence for a finding that this omission contributed to the tragedy that occurred some three months later.

¶ 147 Mr. Cleary granted Axes an extension until October, 1996 to complete the retrofit. The extension letter did not in any way authorize a continuation of the maintenance deficiencies identified by SPG. They were not part of the retrofit. The failure of the owners to take action on these deficiencies speaks to their negligence, not to any on the part of Mr. Cleary.

¶ 148 The plaintiffs submitted that the City was required by the Fire Code to appoint an individual to make statutorily mandated discretionary decisions regarding fire and life safety affecting the occupants of high-rise buildings. That individual made those decisions based on an assessment of a claim of financial hardship. The City had a duty to the occupants of high-rise buildings to be satisfied that the decision-maker knew and understood how the finances of apartment buildings worked sufficiently to make a reasonable decision or reasonable exercise of the discretion considering all the relevant factors, including safety. Notwithstanding that his job was to assess claims by owners of apartments, of financial hardship (he never saw an application for extension based on logistical reasons), Cleary's evidence on cross-examination was astonishing: that he himself did not know "... how the finances of apartment buildings work".

¶ 149 Certainly Mr. Cleary's evidence was surprising, but the issue is whether the negligence, if it was negligence, of the City in appointing him, or any careless conduct by him relating to 2 Forest Laneway, caused or contributed to the damages of the plaintiffs. In my opinion they did not. Despite his frailties, Mr. Cleary reached a decision which is supportable upon the financial criteria recommended by the Fire Marshall's October, 1992, circular. It was entirely reasonable for Mr. Cleary to have relied upon the criteria recommended by the OFM in that circular. The amended circular dated September 1, 1994, did not reach him until after the decision in question had been made. The decision reached was not unreasonable and could have been reached by a person familiar with financial statements. The plaintiffs' case against North York on this point fails.

Liability of North York, Part 3: Fighting the Fire:

¶ 150 The heart of the plaintiffs' case as to negligence in the manner in which the fire was fought is set out in their written submissions beginning with paragraph 50 c)(i) as follows:

> Inexplicably, on the morning of the fire, the Incident Commander Chief Hudson failed to take any steps whatsoever to alert or warn the occupants of 2 Forest Laneway to stay in their apartments or exit the stairwells from the time of his arrival at 5:14:44 a.m. By the time Deputy Chief Stewart made that attempt at approximately 5:50 a.m. to 6:00 a.m., after the plaintiff victims were located by firefighters in the stairwells, it was too late. From 5:14:25 a.m. on, those occupants who telephoned the Fire Department Communications Centre, or 911, were being told to "just stay in your apartment". Between 5:14:25 a.m. and 5:30 a.m. there were approximately 29 callers to the Fire Department Communications Centre from 2 Forest Laneway. All were told to stay in their apartments and all survived the fire without injury.

c)(ii) The Fire Department Communications Centre received a call at 5:11:30 a.m. from apartment 514 that they had just woken up to their fire alarm, "... and there is smoke, lots

of smoke in our hallway", which was "... coming from next door", namely apartment 509. This information was apparently communicated over track 18 (one on which Chief Hudson was communicating) at 5:12:41 a.m., that there was "... smoke on the 5th floor, believed to be coming from apartment 509". Inexplicably, Chief Hudson failed to attempt to communicate this information to the tenants and provide them with advice to stay in their apartments;

c)(iii) Commencing at 5:19:12 a.m. the Fire Department Communications Centre received a significant number of calls from occupants regarding smoke conditions in the halls and stairways. For example, at 5:19:12 a.m. occupants called to say they were "trapped on the 10th floor" and reported that "the stairwell is full of smoke". Inexplicably, it appears the Communications Centre did not provide this information to Chief Hudson or if they did, he failed to attempt to communicate this information to the tenants and to provide them with advice to stay in their apartments.
The defendant City did not lead any evidence from anyone in the Fire Department Communications Centre at the time of the fire. Most significantly, the defendant City did not call Chief Hudson to explain his apparent failure to take into account what he knew to be the existence of "lots of smoke" in the 5th floor hallway or to even attempt to communicate with the building occupants until after Deputy Chief Stewart's arrival at 5:45 a.m. and after the discovery of the bodies of the victims.

¶ 151 In summary, this aspect of the plaintiffs' case is that if Chief Hudson had used the building's Emergency Voice Communication System (EVAC) upon arrival or shortly thereafter, to notify the tenants to remain in their apartments, the plaintiffs would have done so and their injuries would have been avoided.

¶ 152 North York had a protocol which called for the use of such a system by emergency crews, recognizing that various circumstances would dictate when the system would be activated. One circumstance was, upon arrival, to notify the occupants that the crew was on the site and investigating the situation. Thereafter, the system could be used to keep occupants informed, to instruct occupants on evacuation procedures and for communication between fire fighters. Chief Hudson did not use the system on arrival and later it was found to have become inoperative due to fire damage.

¶ 153 Earlier in these reasons, I noted that the Webber Report (Report of the Public Inquiry into Fire Safety in High-rise Buildings, December, 1983) accurately reported the dilemma faced by occupants of high-rise buildings during a fire: stay or leave? On balance, Judge Webber thought that evacuation was a preferred option. In hindsight we know that in the 2 Forest Laneway fire, those who stayed in their apartments did not suffer injury; only those seeking to escape via the stairwells did. Nevertheless, the dilemma was real at the time. Uniformly, those who phoned 911 were advised to remain in their apartments. Others, including the plaintiffs, chose to evacuate. Significantly, the protocol did not call for the chief, upon arrival, to advise the occupants to remain in their apartments; it was left to his judgement after evaluating the situation to give whatever instructions were appropriate.

¶ 154 The plaintiffs submitted that Chief Hudson had enough information on arrival to advise the occupants to remain in their apartments. He had heard (there is no evidence he had not) the call on track 18 at 5:12:41 that there was smoke on the fire floor. It was inexplicable that he did not at once pass this information to the occupants. He did not give evidence and the Court should infer that he has no reasonable explanation for this conduct.

¶ 155 It is true that the Chief did not give evidence and that this casts a shadow over his conduct and means that some matters, such as whether he heard the transmission at 5:12:41, may properly be assumed against him. However, despite his failure to testify, the Chief deserves the benefit of an analysis of the evidence we do have from the perspective of the lobby of 2 Forest Laneway and not from the quiet of our offices years later.

¶ 156 On arrival, at 5:14:44, the fire fighters knew that there was a working fire in progress, probably on the 5th floor, venting to some extent out onto the balcony; that there was smoke on the fire floor; and very little else. The Chief put in a second alarm and despatched his available forces to the fire floor; forces arriving in the next wave were sent to perform search and rescue.

¶ 157 While the Chief might have speculated, because of the smoke on the fire floor, that the fire suite door was open, he had no way of knowing that the fire suite balcony door was also open; that the 5th floor fire door to the S1 stair was open; that the fire had gone to flash-over even as he was arriving; and that as a result, the scope of the fire had enlarged into the hall and heavy smoke was pouring into the stairwell. In short, he did not know the facts that made evacuation an impossibility. The first information that there was smoke above the fire floor began to come in from tenants' calls to 911 at 5:19:12 when 10th floor occupants reported the stairwell was full of smoke. Several other calls followed indicating that the entire building was full of smoke. There is no record of this information being passed to the Chief until 5:24:08 when North York Fire reported to Chief Hudson that there was a person on the 17th floor in front of the elevator who could not find her way back to her apartment. While nothing is said about smoke, the inference is clear and Chief Stewart testified that this was the first information to Chief Hudson about the reports of smoke on the upper floors.

¶ 158 The intensity of the fire and smoke at the fire floor became apparent when fire fighters James and Dosant, commanded by Captain Struthers, left the 4th floor staging area at 5:20 to enter the 5th floor. The colour and density of the smoke was severe and most unusual for an apartment fire. Visibility on the 5th floor was zero; they had to feel their way along the wall. Mr. Dosant suffered an injury and he and Mr. James returned to the staging area, which was now on the third floor due to heavy smoke on the 4th. There they met Captain Struthers who recorded them as leaving the floor at 5:35 en route to get treatment for the injury. He said he assumed that Mr. James would inform Chief Hudson of the situation, but Mr. James did not mention doing so in his evidence.

¶ 159 In my view, Chief Hudson was required to size up the situation before taking a step such as instructing the occupants to evacuate or to remain in their apartments. It must be said that the Chief had no reason to suspect that the stairwell was open to the smoke. Chief Stewart testified that in 23 years he had never seen a stair well door compromised. Evacuation was a live option on the facts known to the fire fighters on arrival. Only when it became apparent that there was heavy smoke on the upper floors and in the stairwells would it have been reasonable to conclude that remaining in the apartment was the only option available. That did not become apparent at the fire scene until 5:24 at the earliest and perhaps not until the first wave of fire fighters returned from the fire floor.

¶ 160 It is true, however, that at no time did Chief Hudson attempt to use the EVAC to warn the occupants to remain in their apartments. As he gave no evidence, it is fair to assume that he became aware that evacuation was not possible when he heard the transmission at 5:24. Once the facts became known to him, failure to communicate to the occupants was a breach of proper procedures. No doubt the Chief was very busy indeed at this time with other necessary duties. Perhaps he weighed the various demands on his time and concluded that communication was lower in priority than other duties. Had he so testified, much might have been forgiven him. In the absence of his evidence, I accept the plaintiffs' submission that breach of the requirement to communicate the information as to smoke in the upper floors and to instruct the occupants to remain in their apartments amounted to negligence. I do not accept that this duty arose upon arrival, but only after the transmission of 5:24. The question then remains: did this failure cause or contribute to the injuries of the plaintiffs?

¶ 161 Before addressing that question, it is convenient to consider the further submission by the plaintiffs that North York is responsible for the failure of North York Fire operators who received the calls at and after 5:19:12 to pass on the information that there was smoke in the upper floors and stairways to Chief Hudson in a more timely and direct fashion. The 5:24 call was confined to the person on the 17th floor and did not mention that several other calls had been received indicating that there was smoke throughout the building. No doubt the operators were flooded with incoming calls, but the information was of great importance and ought to have been communicated to Chief Hudson clearly and rapidly. In the absence of evidence from the persons involved, there is no explanation for this failure. It is possible that the Chief would have taken action to advise the occupants had these calls been drawn to his attention, although the call he did receive should have, but did not, lead to any attempt to communicate to the occupants.

¶ 162 Did these failures cause or contribute to the injuries of the plaintiffs? The answer to this question depends upon two factors: whether the EVAC system, which we know had failed by about 5:45 when Chief Stewart tried to use it, was still functioning at the critical time; and whether such an announcement would have come in time to deter the plaintiffs from leaving their apartment, or to cause them to return before getting into trouble in the stairwell.

¶ 163 Sharon Moynes, a 29th floor tenant, testified that she was awakened by the sound of the fire alarms. She recalled that her clock, which read 5:10, ran a bit fast and she thought that the time was actually 5:08 or 5:09. She went to the intercom near the door to listen for announcements. This system was shared by the EVAC system and the intercom for visitors. Hearing no announcements, she pushed the "Listen" button which she knew enabled her to hear any sounds from the lobby, and heard voices and other sounds. She went to get dressed and after a couple of minutes returned to the intercom. There were no announcements, so she again pressed the "Listen" and heard no sound at all, the intercom was dead.

¶ 164 The statement of David Harris, a 16th floor tenant, was put in on consent. He was awakened at 5:10 by the fire alarm which, however, ceased to ring in less than 10 minutes. He attempted to flee, encountered smoke at the 12th and heavy smoke at the 8th floor and returned to his apartment. The heavy smoke was rising up the stairwell as fast as he could walk. He took time to wet a towel and place it at his door and then called 911. His call was recorded at 5:20:55. Likewise, Susan Edwards (suite 2309) and the Hachmers (1807) were driven back to their respective suites by heavy smoke and made 911 calls. The Hachmer call was at 5:17 per Exhibit 72.

¶ 165 Earlier in these reasons, I reviewed the evidence of Mr. Harpur of the OFM as to the speed with which the smoke spread throughout the building. For convenience, I note here that Mr. Harpur concluded that both stairs were sufficiently contaminated with smoke as to be unusable from the 4th floor to the 30th floor as were most of the corridors above the 4th floor. The speed with which this happened was of significance. The 5th floor hall was smoke-filled within one-half to 2 minutes after the first alarm sounded at 5:09 am. (Exhibit 66). The lower levels of the stairs were probably contaminated within 4 or 5 minutes of the alarm sounding and the upper levels to the 30th within 15 and possibly within 10 minutes after the alarm. That would place the smoke at the 30th floor between 5:19 and 5:24. Smoke was thick in the 28th floor hallway between 5:15 and 5:20 a.m.

¶ 166 This smoke and the smoke encountered by Mr. Harris, Ms. Edwards and the Hachmers was the same heavy black smoke described by the plaintiff as overtaking them in the stairwell. He and his mother awoke shortly after 5 am and dressed and fled into the stairwell. Their travels have been described earlier. Pedrum testified that the fire alarm awoke him and was still sounding when he passed out. The evidence of Mr. Harris was that the alarm ceased after less than 10 minutes and the fire fighters said it was not sounding in the lobby when they arrived at 5:14. The heavy black smoke was rising rapidly in the stairwells between 5:10 and 5:20. This evidence is not all totally consistent, but it is probable that the smoke overcame the plaintiffs at the 30th floor between 5:20 and 5:25. At that time, they had already been in the stairwell for many minutes in order to have time to take the route that Pedrum described. Beginning at the 17th they descended several floors and then climbed to the 30th, a total of perhaps 20 floors all together, 4 or 5 down and the rest climbing in a smoky atmosphere. It seems very probable that they had left their apartment before the fire department arrived at 5:14. No conceivable announcement by Chief Hudson could have prevented their leaving the apartment. By the time that he could have grasped the scale of the smoke problem, even with perfect communication of the calls from tenants to 911 which began to mention smoke away from the fire floor at 5:19, it is most improbable that an announcement would have assisted them. They were trapped on the 30th floor, 13 smoke-filled floors away from their apartment.

¶ 167 David Goodyear of the OFM testified as to the fire alarm and EVAC systems. He had been a Fire protection Technologist with the OFM since 1983 with a particular specialty in electrical systems and alarms. He has a background in the design of alarm circuits for safety systems and has been active on ULC committees establishing standards for such systems. He was assigned to investigate the electrical and alarm systems at the fire site and arrived about 9:30 am on January 6, 1995.

¶ 168 He found the fire alarm system in the 'alarm state.' Fire alarm bells were ringing below ground but not in the lobby or in the tower. He investigated why the tower bells were silent. The fire alarm manual pull station at the 5th floor east stair exit had been destroyed in the fire. Three cables for the alarm circuits for the upper floors passed through the junction box at this pull station and two were visibly fire damaged. When these cables were replaced, the circuits from the ground floor to the top of the tower became operational. There were also certain incorrect bells installed in three of the circuits. Tests showed that these bells would fail within 7 to 14 minutes of activation of the alarm. He testified that the silence of the bells noted by the firemen on arrival at 5:14 indicated that the fire damage had been done by that time.

¶ 169 The 5th floor east side EVAC speaker was located high on the west wall of the corridor some 10' south of the fire stair door. There were three multi-conductor cables passing through the speaker box carrying the circuits that provided the signal to all speakers in the building. These cables were separated from the fire by a perforated metal grill and the paper cone of the speaker. This did not provide much protection and the cables were badly damaged in the fire, short-circuiting the system and rendering the EVAC unusable. Testing showed that announcements from the lobby microphone produced virtually no sound on any of the floor loudspeakers. Replacement of the damaged cables restored the functionality of the EVAC.

¶ 170 Mr. Goodyear was asked to consider how long it would have taken for the fire to destroy the EVAC circuits and short out the system. He pointed out that flashover is a change of state in a fire and there would have been a tremendous amount of heat generated and at those temperatures electrical wiring would not last more than five minutes. In cross-examination, it was put to him that he had not given such an estimate during his evidence at the Inquest. There he had noted that it was difficult to estimate when the EVAC would have ceased to work; the best indication would be looking at the alarm bells which were closer to the fire but were better protected, so the time frame for failure would probably be "not too far different". It was possible that the EVAC, like the fire alarm, was out when the fire fighters arrived. Before me, he explained that he had been asked about the time for the first time at the Inquest. Since then he had given further thought to it and reached his conclusion. Since the conclusion is not very different from his Inquest evidence and is in accord with the evidence of Ms. Moynes, I think it reasonable to conclude that the EVAC was, in all probability, not available to Chief Hudson after 5:20 am.

¶ 171 It follows from these findings that the failures of the North York Communications Centre and of the Chief did not cause or contribute to the injuries of the plaintiffs.

Summary as to Liability:

¶ 172 The defendant Merv Doctorow negligently allowed the fire to start. The Axes/Tandem defendants were the occupiers and failed in their duty in the manner described above. The City failed to properly interpret and enforce its own by-law. Each of these acts or omissions contributed to the plaintiffs' injuries. In considering the issue of the comparative negligence of each, I am struck by the central role played by the absence of SCDs on the suite doors, and the failure of the 5th floor fire stair door closer, aspects in which Mr. Doctorow played no part; and by the open fire stair door in which neither Doctorow nor North York played a role. The City's operative negligence occurred once, in the process of approval of the plans over 20 years before the fire. The negligence of Axes/Tandem went on for years as they failed to remove the risk which they knew or ought to have known was created by the absence of these essential safety devices, and failed to maintain the fire stair doors. They must bear the greater part of the loss. I assess the respective degrees of fault as follows:

Doctorow: 10%
North York: 20%
Axes/Tandem:70%

The Injuries I: Zari:

¶ 173 Prior to January 6, 1995, Zari Bakhtiari, age 41, was employed as a Customer Service Representative by the CIBC. She lived independently at 2 Forest Laneway with her dependent son Pedrum. She had been educated in Iran where she obtained a degree from the University of Tehran. She had come to Canada from Iran by way of Turkey with her husband and two small sons in 1986. The parents separated and were divorced in 1991 and she became self-supporting. She was respected by her sons who looked to her for guidance and in Pedrum's case care. She was respected by her employer and was doing well in her job. Her income was modest but sufficient. She had opportunities for advancement with the Bank. She had friends, took a course to improve her education and lived a quiet but pleasant life.

¶ 174 Six years after the fire she is unemployable and isolated due to severe cognitive deficits from hypoxia, CO poisoning and smoke inhalation. She still has upper back and neck pain, is prone to headaches when she pushes herself, or gets cramps in her hand from writing.

¶ 175 The plaintiffs submit that Zari's injuries are permanent and that she will require extensive future care to provide her any sort of quality of life. She has not been able to work since the fire and the evidence supports that she is permanently unemployable. Her attempt to return to work was a dismal failure. Zari suffers from and will continue to suffer from post-traumatic stress disorder that will affect and impair the quality of her life for

the foreseeable future. No improvement in this condition is reasonably foreseeable.

¶ 176 The defendants' position through most of the trial was that Zari would be able to return to work, but ultimately this was abandoned and it was conceded that she would never work again. As a result, much of the evidence as to her condition need not be reviewed in detail. However, some of the evidence also throws light on her quality of life issues.

¶ 177 The plaintiffs say that the real issues remaining in dispute regarding the assessment of Zari's damages are:

(1) Zari should be entitled to an amount equivalent to the value or the benefit of some or all of the future care items identified by Ruth Whitham, the future care consultant, as being those required to restore to her a reasonable quality of life, including transitional and assisted housing.
(2) There is a risk that Zari will suffer from early onset dementia and that this risk should be reflected in her award of general damages.

¶ 178 These two points are inter-related since the prospect of a premature onset of dementia would greatly influence the future care plan and so the costs predicted by Ms. Whitham in her evidence. The first point largely depends on the reliability of the evidence of Ms. Whitham, as the defendants did not call a future care consultant. The second point involves my assessment of the conflicting evidence of Dr. Upton for the plaintiffs and Dr. Stewart for the defendants as to whether the hypoxic insult to her brain introduces a probability that Zari will suffer an earlier than normal onset of dementia.

¶ 179 One of the issues relevant to that medical controversy is whether Zari suffered a physical trauma to the head as well as the hypoxic trauma. This requires a review of the evidence of her son Pedrum. Zari has no memory of the incident. Zari and Pedrum attempted to escape first through the stairwell at 2 Forest Laneway and then attempted to go to the roof but the exit door was locked and the roof hatch would not open. They then went down a floor and just above the landing the heavy black smoke reached them and it was impossible to see or breathe. They were holding hands on the stairs when this happened and when the smoke came, Pedrum tried to pull his Mother down low to the floor and himself knelt down and passed out. Pedrum was found on the stairway to the mechanical room floor, just above the landing at the 30th floor. Zari was found by the fire fighters on the 29th floor. Since they were together when the smoke came, and the effects were very swift, she would have had no chance to walk down that flight of stairs. The inference is that she fell down one flight of stairs.

¶ 180 It was submitted, correctly, that the hospital records did not refer to cuts, scrapes or bruises such as might accompany such a fall. Dr. Upton reviewed the Toronto Hospital records and testified that he did not find any bruises or injuries recorded in the early days, and that subsequent recorded complaints about neck and hand and arm pain may have been related to other factors. On the other hand, the medical attendants could get no complaints from her in the early days as she was unconscious and they had much more serious issues to contend with. The records show that a CT Brain Scan performed on January 9th revealed a normal brain with no infarcts or haemorrhages. When she regained consciousness Zari felt pain "everywhere"; her right hand could not be moved and she had severe right shoulder and upper back pain. This upper back and neck pain continues to the present.

¶ 181 In August 1995, Dr. Skaredoff saw Zari for assessment of her pain. He observed pain ranging from tenderness to 'exquisite' in her shoulders and neck. He wrote that her possible fall down the stairs might account for some of her neurologic deficit along with the CO 'but also the stretching and possible tearing of the various ligamentous attachments of the neck muscles resulting in microscopic hemorrhaging and fibrosis with resultant low grade inflammation of the tendinous structures of the neck musculature.' Dr. Skaredoff concluded that an absolute diagnosis of head injury had not been confirmed, but it could 'be well inferred'.

¶ 182 Zari was free of such pain before the fire and there does not seem to be anything in the evidence to account for it unless she did fall down the stairs. As Pedrum was trying to pull her down to the floor, there is a very good chance that Zari was off balance already when she passed out. I think it very probable that she had that fall and got banged around a bit in the process. There was a reference to smoke smudges on her face. The results of the scan seem to be evidence against any serious physical blow to the head. I am satisfied that the pain she experienced in her neck and shoulders was a direct result of a fall down those stairs. A blow to the head cannot be

ruled out on the basis of the available evidence as to the events in the stairwell and on admission to the Emergency.

¶ 183 The admission note on Zari's arrival at the Toronto Hospital, as Jane Doe, indicates that she had a Glasgow Coma Scale of 3 at the fire site and was intubated by the paramedics. Three is the lowest scale on the GCS and is essentially 'vital signs absent'. Notations were made as to carbon monoxide poisoning, respiratory and cardiac arrest, second degree hypoxia and brain ischemia, and a carboxyhaemoglobin level of 10%. As a result of the clinical findings she was taken to the hyperbaric chamber. She was unconscious for 9 days in the ICU, breathing at first with the aid of a ventilator. She was weaned off the ventilator on January 13, 1995. She was able to whisper on the 14th. Her total stay at the Toronto Hospital was 48 days. Zari had extensive post traumatic amnesia time indicating a severe brain injury. A diagnosis of hypoxic encephalopathy and respiratory failure was made. This diagnosis is not disputed by the defendants.

¶ 184 As early as the 10th a consultation note observed that Zari was "... at risk for some cognitive impairment". Prior to leaving the Toronto Hospital she showed signs of posterior left cerebral dysfunction, right hand impairment/weakness, intellectual deficits, anxiety and panic attacks, headaches, and chronic pain. Zari was discharged to St. John's Hospital on February 21, 1995 where she underwent some neurological rehabilitation. She was discharged on March 31, 1995 and was admitted to the Day Treatment Program at West Park Hospital on July 26, 1995 and discharged in December 1995 back to the community. She received psychotherapy from Dr. Tahbaz in 1995. She was treated at Columbia Health Centre for her memory problems from February 1997 to April 1998. She saw Ms. Whitham for therapy in 1995-97. Thereafter, due to lack of rehabilitational funding, only minimal cognitive/behavioural therapy and chronic pain treatment were provided despite the strong recommendations for intensive therapy from Dr. Skaredoff, Dr. Cancelliere, Dr. Tahbaz and others.

¶ 185 The most comprehensive medical evidence for the plaintiffs was given by Dr. Adrian Upton (Head, Division of Neurology, McMaster University). He was not a treating physician for either plaintiff, but is a neurologist of great learning and experience. Among other attributes, he is a reviewer for ten medical journals, has patents, including a 'pacemaker for the brain', lectures regularly to students, sees 65 patients a week and has published as author or co-author over 300 publications. Zari's condition and prognosis were summarized in his report dated April 25, 1997. In his report and in his extensive oral evidence, Dr. Upton reviewed the numerous medical and psychological reports relating to Zari's condition and drew the following conclusions:

(1) As a result of the fire Ms. Bakhtiari suffered hypoxia, acidosis, and a general reduction of availability of oxygen to the tissues, particularly the brain.
(2) Correction of the hypoxia was attempted using intubation and oxygen. However, it is probable that reduced breathing, swelling of the throat and smoke inhalation produced reduced absorption of oxygen. Pre-accident anemia and 10% carboxyhaemoglobin (carbon monoxide inhalation) were additional adverse factors.
(3) The hospital record and history are consistent with the effects of a hypoxic brain injury.
(4) The plaintiff had some spasticity (increased reflexes, reduction in motor control) and tremulousness (shaking - a common hypoxic symptom) in the upper limbs.
(5) The effects of such hypoxic brain injuries overlap with the effects of closed head injuries, including:

* headache
* memory loss
* reduced concentration
* altered mood with irritability, easy frustration depression and anger
* fatigue
* sleep disturbance
* dizziness

(6) Ms. Bakhtiari has had extensive neuropsychological testing showing a broad impairment of function in comparison with her pre-accident levels of function, gauged by her academic and life performance. After the fire she functioned at the impaired to the lower levels of the normal range, for example, 16th to 25th percentile:

* full scale IQ - 16th percentile
* verbal IQ - 25th percentile
* performance IQ - 9th - 16th percentile

A performance at the 16th percentile indicates that about 84% of the population will do better than she does. There was little improvement over time from the tests of Dr. A. Cancelliere (July 1995) to March 1997 (Neurovocational Assessment, Sharyn Butt, Allison Roberts and Dr. Robert Gates).

(7) She suffered some general muscle aches and pains. These were probably due to:

* her probable* fall down the stairs on January 6, 1995
* multiple myofascial injuries
* inability to cope with the symptoms due to the hypoxic brain damage, mood change, depression and irritability. (*corrected to 'possible' during oral testimony).

(8) Zari did not receive intensive cognitive, behavioural and physical rehabilitation after the events of January 6, 1995. This reduced her opportunity to reach her maximal potential level of recovery.

¶ 186 Although Dr. Upton referred to Zari as having probably/possibly had a fall down the stairs, he made it clear in cross-examination that his opinion did not depend on her having had an external head injury.

¶ 187 Dr. Upton concluded that Zari's symptoms were organic and related to the events of January 6, 1995. The apparent psychological and psychiatric problems were a consequence of the brain damage and hypoxia of January 6, 1995. Most recovery from brain injury occurs in the first six months to two years after injury. Recovery is slow and limited after this time. It is probable that the combination of physical, emotional, cognitive and behavioural problems will render Zari unemployable in any competitive work area. The potential for retraining is severely limited and the main window of opportunity for recovery has been lost. She will probably suffer from an early onset of dementia.

¶ 188 Importantly for our purposes, given the concession that Zari will not work again, Dr. Upton stated that she will need supportive care, counselling and measures to improve her quality of life in the absence of a return to work.

¶ 189 There is no real disagreement from the defence psychologist, Dr. Travis and neurologist Dr. Stewart as to Zari's diagnosis and ongoing symptoms as described by Dr. Upton and the physicians upon whose reports he relies. There is, however, a disagreement with respect to prognosis. That disagreement centres around the last paragraph of Dr. Upton's report of April 25, 1997 in which he opines that the severity of the brain injury to Zari will lead to an early onset of dementia and inability to function, probably manifesting itself around age 55 and leading to an ongoing requirement for supportive or custodial care for her life expectancy. This disagreement will be dealt with later.

¶ 190 Dr. A. Cancelliere did a neuropsychological assessment of Zari on two days in July 1995, some 6 months post-fire. Dr. Cancelliere is an eminently qualified psychologist accepted by the Court as an expert in the areas of psychology, neuropsychology (the study of the brain with respect to behavioural relationships) and clinical psychology. He has in his resume considerable experience in dealing with the head-injured patient including responsibility at Toronto Western Hospital for, inter alia, developing a head injury rehabilitation program. His practice involves working with brain injured patients, doing neuro-psychological assessments (60-70%) and working with such patients to rehabilitate them (30%). He also does work assessing the competence of persons to manage their affairs or their personal care. That work would bring him into contact with persons at or about the early manifestations of dementia. Two of his reports were filed and he gave evidence.

¶ 191 He found low average verbal and non-verbal intellectual abilities with impairments in many areas. Some important impairments for our purpose in assessing Zari's life skills outside of the work environment included vocabulary, attention, immediate memory, social judgment, abstract concept formation and mental flexibility, all of which may impact upon her life quite apart from work. There was evidence of frontal lobe dysfunction which would impair her executive functions. Dr. Cancelliere concluded that Zari's condition likely represented acquired declines from her premorbid status and was compatible with brain damage sustained on January 6, 1995. Further, she fulfilled the DSM-4 criteria for Post-Traumatic Stress Disorder (PTSD) which was directly related to the fire. Objective psychometric assessment was compatible with PTSD. Her depression was rooted in her physical and cognitive limitations; she was anxious, fearful and possibly tending towards withdrawal and isolation. These results suggested a serious disability. Further limited

spontaneous recovery was likely; with active rehabilitation and treatment meaningful but limited gains were likely.

¶ 192 In March, 1997, Zari was seen by Dr. Robert Gates and his associates at Columbia Neuro-Rehabilitation Services for a neuro-vocational assessment. Dr. Gates had the report of Dr. Cancelliere and reported that Zari's: "... performances have not changed in a substantive way. She appears to exhibit the same degree and pattern of intellectual impairment ... ". His estimate of her premorbid intellectual ability, based on her educational and employment history was that she functioned at the average or 50th percentile range. Her performance suggested that she had suffered a loss of general intellectual function. He thought that she did not have the impairments in social judgment that often accompany brain damage and so should be able to maintain pleasant and socially appropriate interpersonal relationships. I have difficulty with this last opinion given the evidence of Zari's tendency to withdrawal and isolation reported on by Dr. Cancelliere.

¶ 193 Defence psychologist Dr. Keith Travis saw Zari in March, 1998. His behavioural observations during testing were largely consistent with the plaintiffs' expert reports. His conclusions were marginally more optimistic than Dr. Cancelliere's and he felt that she had not done as well as she might have on the tests. Although she had been co-operative and not malingering, there was a slowness and lack of drive apparent. He accepted that this was the result of depression. He thought that the changes in her personality were not all organic; that some were a result of psychological trauma and could be improved by treatment. Nevertheless, he wrote:

> "Without question, Ms. Bakhtiari is clinically depressed and shows features of subjective depression, psychomotor retardation, extremely low energy and activity levels, as well as general malaise. Ms. Bakhtiari's levels of self-esteem and confidence are low and diminished from pre-morbid levels. She has lost much of her former sense of self-efficacy. There was evidence of anxiety-related components to her continuing psychophysiological and cognitive complaints. There was evidence of discomfort in social situations, as well as social alienation/avoidance."

¶ 194 Dr. Travis concluded that: "The circumstances of the fire, including the failed attempts to escape, and other psychologically problematic events taking place in the aftermath would ordinarily be expected to generate intense emotional reactions, if not the symptoms of psychological trauma." He also wrote: "... there is copious documentation of psychophysiological, cognitive and emotional/affective symptoms, including significant disturbances of sleep, anxiety, and depression. The onset of such symptoms was relatively immediate and dates back to shortly after she regained consciousness and an initial appreciation of the consequences of her injuries and functional limitations." He thought it unlikely that Zari would ever be capable of returning to her pre-accident employment as a customer service representative. Nor was there much to be gained by urging her to return to school for further academic or technical skills training.

¶ 195 Dr. Travis conceded in cross-examination that there was a medical consensus that Zari's complaints were consistent with organic brain injury. Organic brain damage can result in complaints of depression and anxiety. There can be secondary factors involved. He agreed that it is difficult to separate organic symptoms from psychological symptoms. Clearly one cannot restore damaged brain cells and in treating organic brain damage one must try to optimise what capacity the patient has left. With non-organic depression and anxiety, one may also not be able to restore a patient to the pre-morbid state, so rehabilitation may be more a question of maximising the patient's quality of life.

¶ 196 Prior to Dr. Travis testifying, Ruth Whitham had given evidence about Zari's future care needs and a number of issues had arisen during her cross-examination as to her views of Zari's condition. Dr. Travis was cross-examined on a number of these issues and some of his answers supported the evidence of Ms. Whitham. He said that organic brain injury can increase the patient's anxiety, cause sleep difficulties and depression, and affect the patient's quality of life in general. It can cause fatigue and it is not unusual for brain injured persons to be reporting fatigue five or six years after the injury. Fatigue in turn can exacerbate cognitive deficits, fuel anxiety, provoke erratic sleep patterns, deepen depression, decrease pain tolerance, reduce the ability to control anger and decrease the patient's coping abilities. Zari suffers from fatigue which could be seen during the taking of the tests he had administered.

¶ 197 Ms. Whitham had spoken in her evidence of a "downward spiral" experienced by some brain injured patients. Dr. Travis was asked if it was fair to say that brain injured persons' complaints can interact so as to

produce a downward spiral in their condition. He agreed that the interaction of problems caused by the injury can result in such an effect: social isolation, helplessness, hopelessness, high tuned anxiety, suicidal ideation, depression, all can be caused by organic brain injury. He diagnosed Zari as being clinically depressed.

¶ 198 Defence neurosurgeon, Dr. Horsey, saw Zari on March 10, 1998. He was not available to testify at trial due to illness. In his March 17, 1998 report which was filed, he accepts the diagnosis of hypoxic encepalopothy. Over the objections of Mr. Outerbridge, I allowed Dr. Bruce Stewart to testify in his place and no reference was made to Dr. Horsey's report in the submissions of the defence.

¶ 199 Dr. Cancelliere re-examined Zari in December 2000. She came from British Columbia by overnight plane which could have affected her performance. His assessments of Zari in 1995 and December 2000 were essentially consistent with that of Dr. Travis in 1998. He disagreed with Dr. Travis that there was anything unusual about Zari's low scores on some tests. Dr. Cancelliere found that Zari's overall profile across all the assessments was consistent with what one would expect given Zari's brain injury. He stated that her deficits are permanent as would be expected given the extent of her injuries. He had seen the report of Dr. Gates and had reviewed Zari's educational background to get a base of comparison in order to estimate the degree of deficit from her pre-morbid condition. It was put to him that her C- in her accounting course at Ryerson in the fall of 1994 was an indication of only average intelligence. He did not agree. Based on all the information that he had, there was a very good possibility that she had been of above average intelligence and one C- did not change that opinion.

¶ 200 In his evidence, Dr. Cancelliere said that Zari presented well 'superficially'. Expanding on the point, he said that for the first few minutes of contact she is pleasant to interact with, but spending more time with her you begin to see her significant problems. This is why she feels isolated, she cannot form social alliances of any depth. She will probably not be able to establish a social network and is likely to remain, as she has been since 1995, a relatively isolated unemployable person.

¶ 201 Her isolation has an effect on her prognosis. Dr. Cancelliere testified that it is well known that brain injured persons are more susceptible to earlier loss of cognitive functioning as they age. This may be because they have lost brain cells due to their injury which are then not available as they age to replace cells dying in the normal course. But as well, the maintenance of cognitive function as one ages is in part a function of use: 'use it or lose it', so that a person such as Zari, isolated socially and not in the work force, does not have the protective factor of use that others less isolated have which would lessen the likelihood of premature onset of dementia.

¶ 202 Dr. Cancellierre's December 14, 2000 report concludes:

> "Functionally, while Ms. Bakhtiari has some strengths, she would be unable to utilize these strengths based in her significant impairments and weaknesses as well as her executive dysfunction. My own earlier assessment found significant evidence for frontal lobe dysfunction. Damage to the frontal lobes is particularly vexing from a vocational perspective because of executive dysfunction. Executive function refers to a number of cognitive processes necessary for adaptive functioning in the real world. These include initiation, planning, hypothesis generation and evaluation, mental flexibility, self-monitoring and awareness, self-regulation, judgment and feedback utilization. An additional obstacle to functional utilization of her strengths is her lack of insight into her difficulties. She is unable to recognize her own impairments and weaknesses and would likely have great difficulties using feedback to alter her performance in any employment setting. Her manner of presentation leads others to over-estimate her abilities.
> Ms. Bakhtiari is not and will not ever be employable in her premorbid capacity. She would be unable to take on any full-time position within the CIBC or with any other organization. While it is possible that she may come to participate in some part-time employment, this is unlikely on a competitive basis. What would be required here is a position which allowed her to utilize her pleasant (but superficial) verbal manner and presentation in isolation. Her intact abilities on intelligence testing involved only basic auditory verbal echoing (e.g. digit span) and her fund of information. Any such position should not involve any responsibilities which are dependent upon her impairments or weaknesses. Thus, attention to visual detail, understanding of English (e.g. vocabulary), a regular

pace of movement, basic arithmetic capacities, and any degree of social judgment should not be necessary. She should not be required to read, remember information, or undertake fine motor tasks. No unusual circumstances should present themselves. No degree of problem solving, independent judgment or dealing with changes independently should be encountered. Finally, she would likely be unable to utilize feedback from an employer. Change in her behaviour should not be expected. These restrictions are all based upon her neurocognitive profile as documented by myself and Dr. Travis. I believe that these exclusion criteria would exclude any competitive vocational position - even on a part-time basis. In my opinion, part-time competitive employment either currently or in future is unlikely. To add to the analysis above, the likelihood that she will show accelerated neurocognitive declines as she ages will further compromise her status over time."

¶ 203 In their submissions, defence counsel pointed out that Dr. Stewart disagreed with the last sentence of the above, as in his view brain injury does not accelerate the onset of dementia except in cases of dementia pugilistica. While Dr. Cancelliere is a psychologist and not a neurologist, his opinion is, in my view, entitled to weight in the light of his experience as detailed supra. As well, he was not cross-examined on this statement although counsel knew Dr. Stewart's views.

¶ 204 Dr. Pieter Butler was called by the plaintiffs and was accepted by the Court as an expert in psychiatry. He has been in practice for many years and was the only psychiatrist to testify. The defendants did not have the plaintiffs examined by a psychiatrist. Dr. Butler examined both Zari and Pedrum and wrote reports on each. He described the condition of post-traumatic stress disorder as one suffered after a serious harm, where helplessness was a primary condition. The victim experiences shock, helplessness, a sense of unavoidable serious harm, and a sense of defeat. There are a whole cluster of symptoms, which include:

* Avoidance
* Sympathetic nervous system arousal, i.e. a siren could start which would remind the victim of the sound associated with the accident, namely the fire alarm.
* A shortness of breath and sweating, tremors and

¶ 205 Dr. Butler stated that PTSD can be totally disabling and makes one feel as if one is constantly living an unsafe existence. It can also be partially disabling. Literature showed that after 2 years there was an equal chance of recovery and non-recovery, and that the longer the disorder lasts the greater the chance is that there will be no recovery. After 7 years the chance of recovery is down to 20 - 30% or less. PTSD can exist in the presence or absence of organic brain damage. The presence of organic brain damage makes the treatment of PTSD more difficult, because the patient would be unable to utilize new information received in treatment. The emotional instability associated with brain injury causes its victims to be more impatient, to act impulsively and sometimes to dismiss their caregivers.

¶ 206 Dr. Butler found signs of frontal lobe damage. He testified that damage to the frontal lobe areas can cause patients such as Zari to believe they are actually quite well and need no treatment. This injury causes an impairment of judgment and a lack of awareness which is exceedingly difficult to treat. The patient is unaware of her lack of insight and judgment. In her evidence Zari said she did not believe that she was as badly off as the doctors claimed. She just wanted to get something to do and get on with her life. The frontal lobe is where executive decisions are made, translating a concept into a series of steps. Zari cannot carry out simple executive functions such as plan the making of a chicken dish or the week's shopping, two of the problems she was asked to solve. When asked to do the latter, her reaction was: "I'll get Pedrum". This condition is not likely to improve.

¶ 207 Zari's work life would be adversely affected by her condition. Although she presents well, she would convey her uneasiness to her prospective employer. Zari has trouble with calculating which would come to the attention of any employer early on. She tires easily. She has grandiose ideas of what she can accomplish which are contrary to her performance capabilities. At work her relationships would be impaired, as she is closed off, constricted, and unreachable. Zari's personal life would also suffer in the same way. She is emotionally dependent, but is unable to give back. She is impatient, and has trouble organizing. This was supported by the evidence of her sons. Zari has done her best to maintain the impression of a dignified, immaculate person, but she has been disabled

since the fire. The prognosis for improvement is poor; she will stay as she is. Her PTSD is chronic.

¶ 208 It was put to Dr. Butler that, as Zari had no memory of the fire, she did not meet the criteria for PTSD. He disagreed, stating that as Zari had experienced the fire, she could re-experience the fear without recalling the event. He thought that she did have some recall of grey spaces. Literature showed that PTSD could occur in the absence of memory of the event. It was also put to him that some literature showed that loss of consciousness during the event may protect patients from PTSD. Exhibit 28 is an article from the British Journal of Psychology by two psychiatrists at the University of Bristol suggesting that loss of consciousness may protect patients from developing PTSD by preventing the activation of further brain circuits. The same Exhibit contains a letter from a psychologist at the University of Surrey and a psychiatrist at St. George's Hospital Medical School about this article, disagreeing with it and stating that several ways in which PTSD can develop despite loss of consciousness and post-traumatic amnesia have been reported. These include distressing 'windows' in memory and isolated memories during post-traumatic amnesia. The correspondents conclude that available studies show that unconsciousness may not protect an individual from [PTSD] but not that this never occurs. One of the authors replied to the correspondents thanking them for drawing attention to articles of which the authors had been unaware, and raising questions as to why intrusive traumatic images could occur despite unconsciousness. On re-examination further instances of the development of psychogenic symptoms despite loss of consciousness were discussed, including data from Exhibit 28 itself. Dr. Butler stated at the end of his testimony that his opinion remained that Zari suffered from PTSD. I accept Dr. Butler's evidence.

¶ 209 Dr. Marvin Weber gave evidence for the plaintiffs. He is a qualified neurologist whose expertise was conceded by the defence. He has a special interest in migraine headaches. He examined Zari on November 24, 1995 with respect to her headaches. In his report he explained that there were some similarities between migraine and brain injury sequelae; in fact, migraine was the leading symptom of post-concussion syndrome. He concluded that Dr. Cancelliere's testing was the most sensitive objective measure of Zari's neurologic deficit and that the greater part of her deficit was due to the hypoxic damage done to the brain. He postulated a fall down the stairs as the way to account for her complaints of neck, shoulder, thoracic and scapular pain, dizziness, headaches with associated paresthesia and weakness and attention deficits, all of which are symptoms of post-traumatic or post-concussion syndrome. In 1996 he saw an improvement in her condition which made him optimistic that she could return to work, but at a lesser level than before. In November 2000 he saw the report of Dr. Butler and its contents persuaded him that his 1996 optimism was not well founded and that Zari was permanently unemployable. He wrote in his November 29, 2000, report: "The patient's current disability will be her lifelong disability and I would agree with Dr. Upton when he suggests that this patient is prone to the development of early dementia (Alzheimer's Disease).

¶ 210 In his evidence he noted that Zari had some risk of developing epilepsy, although 80% of patients who develop epilepsy after brain trauma do so within two years. As she was not yet 10 years after the injury, she must still be regarded as at risk. Her December, 1995 EEG showed mild diffuse slow features and not the waves and spikes characteristic of a propensity to epilepsy. He thought it much more probable that she would not develop epilepsy, than that she would. He was cross-examined on the difference between himself and Dr. Upton on the possibility of epilepsy, which Dr. Upton had discounted. He stuck to his opinion, noting literature references to support his view. He also noted that where there were several disciplines reviewing one case, it was common for them to see things differently. The bottom line was that the patient suffered hypoxic encephalopathy and developed severe and frequent headaches after the event. The headaches had the features of migraine. He had thought they were post-traumatic, but if there was no fall, then the migraines were induced by something in the fire. It was asking too much of coincidence to suggest that these headaches, which came 'thick and fast' for a year after the fire had nothing to do with it Migraine was his contribution, hypoxia was the diagnosis of ten persons who have seen her and the post-traumatic stress disorder was the finding of those qualified to diagnose it. Dr. Weber was not cross-examined upon the basis for his agreement with Dr. Upton that Zari was prone to the development of early dementia.

¶ 211 Dr. Bruce Stewart testified for the defence. He is an experienced neurologist who was an Assistant Professor of Neurology at the University of Toronto for 20 years and is now in private practice. He is in the Canadian Boxing Hall of Fame for his achievements as a university boxer. He has a special interest in dementia pugilistica, the progressive end-stage of the chronic traumatic encephalopathy of boxers. He challenged the 'Upton Theory' saying that Dr. Upton's evidence had not proved it and it

was not consistent with the current opinion of neurologists. It was his view that there are but two types of progressive dementia, Alzheimer's Disease and vascular dementia which arises from events such as cerebral stroke. The only form of late appearing dementia caused by brain trauma was dementia pugilistica, a condition essentially confined to boxers and arising from repeated blows to the head. For some reason which is not understood the consequences of this particular form of trauma are often delayed for years before appearing. In his practice he had not seen a patient with hypoxic encephalopathy from smoke/CO go on to develop a progressive dementia. Dementia pugilistica was a specific and rare phenomenon and could not be used to infer that other forms of brain trauma produce a progressive dementia of the Alzheimer-like type.

¶ 212 Dr. Stewart had prepared an unpublished paper in February, 1999 reviewing the literature on the subject of a possible connection between head trauma and the later development of Alzheimer's disease. The papers reviewed were not consistent. Some found no statistical relationship; others found possible relationships; one referred to a 'putative' relationship. Dr. Stewart concluded that: "... there has not been a clear association established between Alzheimer's disease and head injury."

¶ 213 In his report of January 15, 2001, after reviewing the reports on Zari, he concluded that she did have cognitive impairment resulting, in all probability, from the hypoxia associated with her CO poisoning. It was permanent and appeared to have limited her employability. However, Zari was not at risk of a gradual deterioration in intellectual function at an earlier age than normal.

¶ 214 By way of contrast, I quote the final paragraph of Dr. Upton's report of April 25, 1997:

> There is increasing evidence that brain injury is associated with an increased probability of subsequent dementia. Recovery often involves gradual improvement for about two years, a plateau of recovery and maintained function and then gradual deterioration in intellectual function at an earlier age than normal. In my opinion the severity of the brain injury in Zari ... will lead to an early onset of dementia and inability to function. In my opinion it is probable that this deterioration will occur around the age of 55. Her life expectancy will probably be normal and therefore there is a probability that she will require supportive or custodial care for many years.

¶ 215 During cross-examination he explained this passage and summarized his view as follows:

> Your Honour, I'm dealing with an opinion based upon probabilities and you're quite correct that not every one of us is going to show significant decline with age to the point where we are unable to continue with our work but a proportion of us, a percentage of us will develop a decline which is more rapid than that. Some of those patients will have Alzheimer's disease according to the criteria for Alzheimer's.
> In my opinion, Mrs. Bakhtiari's future is that her probability of developing that decline, which we all have, is increased by the effects of the hypoxia that she suffered, so it is not inevitable that she will decline, it is an increased probability that she will decline. In other words, she has increased the probability that she will suffer an Alzheimer-like process earlier in life than would have been the case in the absence of the fire.

¶ 216 Also in cross-examination, Dr. Upton clarified the time frame for persons who have not suffered brain injury. The incidence of age-related dementia increases in our society after the age of sixty and often after the age of fifty-five. In this lady, there will be an earlier onset of what can be seen in the population and his best estimate was that it would become apparent around the age of fifty-five. The probability was of a five to ten year acceleration of the inevitable decline.

¶ 217 Early in the cross-examination, Mr. Forbes asked for a summary of Dr. Upton's view on hypoxia and dementia and got this, which he then dubbed the 'Upton Theory':

> Various degrees of hypoxia or head injury lead to an increased probability of earlier onset of dementia.
> Later, Dr. Upton elaborated:
> Yes, that the various complex factors involved in a fire can lead to hypoxia; that is a reduction in the available oxygen to the tissues of the body, particularly the brain, as a result of which there is brain damage, as a result of which there's an increased probability of long-term effects, including premature dementia.

¶ 218 Dr. Upton did not accept Mr. Forbes' characterization of his opinion as the "Upton Theory", but stated that it was the accepted theory in the literature. He produced a number of articles from learned journals on various aspects of hypoxia to illustrate the principles involved. He was extensively cross-examined on these articles and Dr. Stewart also reviewed them critically in his evidence, maintaining that they did not really support Dr. Upton or were flawed as studies. I do not intend to rehearse this controversy, which occupied at least two court days, in a blow-by-blow fashion. A few examples will suffice.

¶ 219 An article abstracted at Exhibit 37 page 36 referred to 'age-dependent neurodegeneration in Alzheimer Disease (AD)' as a 'complex interaction' among several factors - genetic, age-dependent bodily changes and determinants such as head injury, stroke or hypoxia, and continued: "A matrix involving each of these complex factors may influence the age of onset of AD in a particular individual". Dr. Upton said the article supported the view that hypoxia could be involved in long-term effects; the point was the inter-action of the factors. Dr. Stewart agreed that a matrix of these factors could influence the age of onset of AD but said that it did not demonstrate that progressive dementia results from hypoxia.

¶ 220 Dr. Upton referred to page 25a. of Exhibit 37, a recent article on dementia pugilistica itself. The article referred to it as the effect of repeated sub-concussive blows. It stated that even very mild degrees of brain trauma can produce neuropathological changes similar to severe trauma. Dr. Upton contended that hypoxia was trauma to the brain and these statements applied to it. The article also noted similarities between the brains of dementia pugilistica and Alzheimer's patients: the presence of a protein E epsilon4; the presence of neuropathology in Meinert's nucleus; compromise of the acetylcholine system and so on. The brains of patients with the two problems showed neurofibrillary tangles, although located in different parts of the brain. All of this showed a potential connection between these conditions in Dr. Upton's view. When he was taken to this article, Dr. Stewart agreed that the author thought that there were very definite similarities between Alzheimer's Disease and dementia pugilistica, but pointed out that the author also showed that there were many aspects that were not similar.

¶ 221 Exhibit 88 includes four abstracts, all concluding that moderate to severe head injuries in young men may be associated with increased risk of AD and other dementias in later life. Significantly, patients who reported loss of consciousness exceeding five minutes were at significantly increased risk compared to those with lesser periods of lost consciousness.

¶ 222 One article concluded that the risk associated with head injury with loss of consciousness was approximately double that where there was no loss of consciousness. Dr. Stewart said that the article did tend to support the hypothesis, although it raised other issues. He did not dispute the conclusion set out as to head injury, but he distinguished head injury from hypoxic injury to the brain.

¶ 223 Towards the close of the cross-examination of Dr. Stewart I sought a further explanation of the distinction being made between traumatic brain injury, i.e. caused by a blow, and hypoxic brain injury. Dr. Stewart confirmed that the evidence had shown that both types of injury killed cells and the death of cells caused the dysfunction. As to why it made any difference how the cells died, since it was their death that led to the dysfunction, he described the slow strangling of cells in AD versus the acute loss of cells in the period of hypoxia. The cells in hypoxia all died at the beginning and their death was not progressive. As to why, if cells can keep dying after the boxer's blows have stopped, they cannot equally keep dying after the hypoxic insult, the answer was that there was no explanation of why that happened, but it did happen. On the other hand the same evidence was not available for hypoxia.

¶ 224 At the end of the cross-examination of Dr. Stewart this took place:

Q. You say that there is no connection between brain trauma and progressive dementia of the Alzheimer type?
A. There are some articles which you have brought out and I have brought out which show that there is a possible relationship. It is not proven.
Q. And that the articles show that other persons, other than Dr. Upton, have extrapolated to infer that there are a number of other forms of brain trauma that produce progressive dementia of the Alzheimer's type?
A. We've heard a great deal about possible relationships which are not true - which are not proven.
Q. Which are not proven?
A. Yes.
Q. And it's your position that until they are proven with a certain degree of scientific certainty that the court

shouldn't accept them? Is that your evidence?

A. I have a very strong opinion on that. If the court makes a decision on a statement that you've suggested here that you say is wrong, it will be a travesty. [Court reporter's version. My note is: If the court makes a decision on such a statement it's a travesty.]

¶ 225 It is clear that Dr. Upton is not alone in postulating the possibility of brain trauma leading to the later development of AD or AD-like processes. In the end Dr. Stewart conceded that there were articles suggesting that, although it was not proven. Whether hypoxia has an effect similar to blows is as yet more problematic, but even on this Dr. Upton is not alone. Both Dr. Weber and Dr. Cancelliere agree with his prognosis for Zari. Neither was cross-examined on this aspect of their evidence. Knowledge of the mechanisms of AD, dementia pugilistica, blows to the brain and hypoxia has many unanswered questions and it seems to me unsound to assume that the possible link between trauma and AD-like dementias shown by the research in evidence is confined to trauma, and the consequent death of cells, by blows on the one hand and excludes trauma, and the consequent death of cells, by hypoxia. Further, it is clear that Dr. Stewart demands proof to a degree of scientific certainty before accepting the possibility. I do not criticize him for that, but it is not the test that I must apply.

¶ 226 There is an area of medical controversy at issue here and I am obviously not going to solve it for the physicians. For the purposes of this case, I am to take into account the possibility of early onset of dementia in Zari if I find it to be a real and substantial possibility - not probability - that it may occur in the future: see Schrump v. Koot (1977), 18 O.R. (2d) 337 (C.A.).

¶ 227 Weighing all of the evidence, I am so persuaded. I accept the evidence of Dr. Upton. I accept that there is a reasonable possibility that Zari will develop a degree of dementia by age 55 to 60 which most of the population will not experience at that age or for some years after. Such dementias, Dr. Upton testified, move at variable speeds and may be dormant until some life event - the death of a spouse, moving from a familiar house, etc. - triggers awareness of the decline. Given her present limitations, the onset of such dementia is likely to have greater and earlier effects upon her than would be the case with most of the population. Dr. Upton estimated the increased probability of dementia as in the order of 10 - 20%. This is a real and substantial possibility.

Damages I:Zari:

¶ 228 Having determined that there is a real and substantial possibility of earlier than normal dementia in Zari's prognosis, it is now possible to address the issue of her future care needs. Ruth Whitham was called by the plaintiffs. No evidence on the subject was called by the defendants. As a convenient introduction to her, I reproduce the descriptive portion of my ruling of February 12, 2001, omitting the legal analysis which led me to accept her as an expert:

> "Neurorehabilitation is a term coined by Miss Whitham to describe one who analyses the life situation of a person who has suffered a major injury to the brain and is having difficulty recovering. She analyses why the person is not apparently succeeding in rehabilitation and suggests strategies for the patient to follow in adapting to the new situation. Forensic rehabilitation is simply performing the task just described when legal proceedings are proceeding currently.
>
> Miss Whitham qualified as a registered nurse in 1969 and is licenced in Ontario. She practiced her profession at the Toronto Western Hospital, McMaster University Medical Centre, Parry Sound Hospital and as nursing crisis manager at Pearson Airport. At McMaster, she worked in the psychiatric crisis unit. In 1987, she sustained a brain injury in a motor vehicle accident, leaving her with post-traumatic headaches and pain. She returned to work in 1990, beginning a consulting practice devoted to the problems of brain injured persons, including medical case management, future care cost analysis, life care planning and educational training for patients and their families. She also practiced therapy specific to chronic pain and brain injury deficits.
>
> In 1993, she suffered a further brain injury in another motor vehicle accident. She has described these injuries as her greatest teacher as to the needs of the brain injured. However, she has also built upon her nursing training by taking numerous courses relevant to rehabilitation, pain management, neuropsychological evaluation of the brain injured and has attended various conferences on neurological subjects.

> In determining the needs of patients, she reviews all medical records, discusses the patient with the treating physicians and convenes meetings of insurers, treating practitioners, patient and family to make her rehabilitation plan. ... She has developed a two hundred and forty question diagnostic questionnaire to identify the patient's deficits as they are understood by the patient. She has made presentations to conferences on this and other subjects related to her practice.
>
> She conceded that her practice is rather unique. She is unaware of others who have exactly her mix of experience in the treating of others, personal knowledge from her injuries and the studies which she has done. She sat for and passed written examinations for entry into the U.S. organization the American Academy of Pain Management. She testified that physicians, including neurologists and anesthesiologists, made up much of the membership of this organization and they sat the same examinations to enter.

¶ 229 Although she had expertise of potential assistance to the Court, there were certain difficulties with the position of Ms. Whitham. She was dismissed by Zari, (although not by Zari's counsel), and had not seen her for three and a half years at the time of trial. She was not present during Zari's testimony and had no direct experience of Zari's current living arrangements or Zari's handling of the activities of daily living. Some of her recommendations seem to be based on the reports of persons (such as Dr. Skaredoff who suggested cryotherapy in 1995, if other treatment modalities failed) who likewise have not seen Zari for years. She could not make the home assessment which she testified was a critical component of a study such as hers. Certainly these factors weaken the force of her recommendations, but they do not make her evidence speculation. She has reviewed the same medical reports which have formed the basis for the testimony in the trial, which is as much familiarity with Zari as was possessed by some other witnesses.

¶ 230 It was submitted, both when she was tendered as an expert, and in the final argument, that she was really an advocate for the disabled and not an impartial witness. She wrote a book which admittedly was designed to alert the disabled and their advisors to opportunities to improve their lot. She is brain-injured herself and this gives her a point of view, but also a valuable insight. I did not find her testimony to be advocacy, certainly not any more than the evidence of most experts I have heard. Sometimes she strayed beyond her medical expertise, but mainly the statements she made as to Zari's medical condition were found in the reports. She did urge that Zari would benefit hugely from going into assisted transitional housing at once rather than at 55. That was said to go beyond even Dr. Upton whose testimony was that she might begin to suffer early dementia by 55 or so. But Ms. Whitham's recommendation was not based on early dementia, but on her experience with Zari and with the brain-injured. Nor did Dr. Upton confine his recommendation to dementia: he stated that Zari would need supportive care, counselling and measures to improve her quality of life if she could not return to work, as she cannot.

¶ 231 In my view, the evidence as to Zari's present condition from herself, her doctors and her sons, is such that she would clearly benefit today from the services available in a setting which left her free to come and go, but assisted her with activation programs and had therapeutic modalities as well. There is no need to wait for the possible onset of early dementia or the normal problems of aging after perhaps the age of 55 or 60. Her present condition, derived from the fire, suffices to make this kind of care reasonable now, as Ms. Whitham suggested. She is unemployable for reasons which also severely impact upon her likelihood of having a happy social life or of remarrying. Her executive functions are severely impaired, leading to difficulties in decision-making and planning in ordinary aspects of life. She does not accept her disabilities, but has unreasonable expectations for herself which she cannot meet. Her level of frustration and anger is high. She requires a high level of attention, emotional investment and care from those around her, but is unable to give much back. She is concerned about the load her injuries have put on her sons, to the point where she worries that they will grow tired of her. She lives with Pedrum, but he has been away and in reality she is alone much of the time, for months on end. This does not mean that she is independent, however. She said that she rarely drives her car, she goes for walks with Pedrum but not often if he is not there. She does not feel comfortable walking alone. She is clinically depressed and has chronic PTSD. She is isolated and likely to remain so. Her very isolation is likely to exacerbate her cognitive problems through lack of challenging use of her remaining faculties. In my view her quality of life would be greatly enhanced by the social activation and rehabilitative opportunities available in the proper setting. Indeed, this is the only way to compensate her for the loss of her former life. The debate in the trial over the specific sites referred to by Ms. Whitham and by the defence surely did not cover all the possibilities. If Zari has to move to obtain the right setting, she should do so, but that is beyond my task. To

help her in these and other decisions, the services of a case manager are properly chargeable.

¶ 232 Although Ms. Whitham's report of April 20, 1997 contains tables of costs relating to overcoming the various barriers Zari faces in rehabilitating herself and living with her disabilities, a revision (Exhibit 51) was put in during the evidence of the accountant Jim Muccilli to capture some of the changes necessary as a result of Ms. Whitham's actual evidence. It was also agreed that these figures would need to be re-done after my findings were available. No doubt Ms. Whitham would be of assistance in that process as well. At this point, I will deal with the principles involved rather than the figures.

¶ 233 As noted, a case manager to help Zari with medico-economic decisions is justified although, if she moves into a care-oriented facility, I would think the role would be less costly than forecast. Similarly, the homemaking support and many of the 'Initial Outlay Costs' would not be necessary if she were in a facility, nor would such costs be chargeable separately if Zari were awarded the funds necessary to live in a facility starting at once. Financial planning advice is desirable, but its relationship to the 5% management fee proposed by Mr. Muccilli is not clear. There appears to be overlap here. To the extent that this covers income tax reporting, the need to file does not arise from the fire. I do not see the evidentiary basis for the pharmaceutical costs of more than $75,000 present value. No physician gave evidence that such drugs would be needed currently or in the future so far as I can discover. Ms. Whitham's report included psychotherapy costs for Pedrum and Pejman in the total for Zari. If allowable at all, such costs must be assessed as part of their damages. The taxi costs are problematic for a person who leases a car currently even if she does not choose to drive it. Work hardening, job coach and on-site job coach are problematic for a person who will not work again, and in any event seem to overlap with the already overlapping life skills training, stress management, and functional restoration programs. The fitness club, the footrest and the day-timer are de minimis and I don't know why the defendants should provide Zari with pocket money when she has a claim for replacement of her lost income. The transitional housing cost estimate stops at age 70 and Mr. Muccilli commented that there was no prediction thereafter. The evidence is that Zari's life expectancy has not been shortened by the fire and the average age achieved by females in Canada was put in as 82. A contingency may well be that development of dementia would lead to a situation where the benefits of such a facility would cease to be meaningful at some point, but I do not know of any evidentiary basis for the choice of a cut-off age at 70.

¶ 234 I recognize that Zari may resist the semi-institutional setting. That is certainly one of the contingencies to be taken into account in fixing the final award. I should reiterate that I do not regard the process which will now take place as mathematical. There are contingencies to be applied to any cost figure.

¶ 235 I turn now to the issue of income loss. Jim Muccilli C.A. of Arthur Andersen prepared schedules for past loss, future loss and pension consequences. He has been preparing such reports for 12 years and was accepted by all parties as an expert. His report is based upon certain assumptions as to Zari's progress at CIBC which he accepted as given.

¶ 236 Zari had been with the CIBC since November, 1991 as a Customer Service representative which is classed as a Level 2 position. She was a permanent part-time employee with a 30 hour work week (full time being 37.5) earning $11.57/hr. which increased to $11.87/hr. on February 26, 1995. Her supervisor from May 1994, Ms. Suzanne Mottram, gave evidence. She regarded Zari as one of the top employees, confident, ambitious, determined to do a good job and competent. She was polite with the customers, immaculately groomed and good at recognizing opportunities for clients.

¶ 237 Zari's October, 1994 performance review covering the year since November, 1993 is in evidence. She met all customers' expectations, had all the skills necessary and needed to work on her own development plan. She had enrolled in a course to better herself and Ms. Mottram testified that this sort of initiative was very rare among her peers. Ms. Mottram also said that she and Zari had discussed that Zari would be taking a securities course offered by the bank the next year. In her opinion that step, which was not common, would be a real plus for her future and would have great significance when Zari sought other positions. The course description in evidence indicates that the course identified by Ms. Mottram as the one that Zari would take would qualify her to sell mutual funds. She remarked in the review that Zari was 'a great asset' and the manager wrote: "Keep up the good work, Zari." Other, earlier, reviews were also looked at and it appears that Zari pretty consistently got a rating of 3: a consistent contributor who achieved performance targets. Most employees

would receive such a rating; a few would get 4 and Ms. Mottram had not seen a 5. Some would get 2 which required improvement.

¶ 238 The next job above the CSR is Personal Banking Representative I (PBR I) which is a level 3 position. PBR I's respond to walk-in customers needs by selling a limited range of bank products including investment, mutual fund and other products. Ms. Mottram said that Zari had the ability to move to level 3 and she would have supported such a promotion when, as Zari's supervisor, she would have been asked. Ms. Mottram felt strongly that Zari had the ability and motivation to move even higher, up to a level 7; there was, she said, room in the CIBC for anyone with ambition.

¶ 239 Since about 1994 all CIBC job opportunities have been posted internally on the computer system and employees can apply at will. Ms. Mottram had done some historical searches and there were numerous jobs available in the appropriate levels. Beyond level 3 was PBR II, similar to PBR I but with a wider range of products to sell and with a base of regular customers in addition to walk-in traffic and classed as a level 4 position. An Account Manager Personal Banking I manages the portfolios of regular clients and does not see walk-in customers and is a level 5 position. Account Manager I manages, under direction, a portfolio of mid-market business relationships in diversified business sectors delivering a wide range of bank services and seeking to build long-term business relationships; it may be seen as a chance to gain the necessary knowledge contacts and experience to manage a portfolio of corporate loan and deposit accounts. It is a level 6 position. Finally, Account Manager II, a level 7 position, manages a portfolio of customers emphasizing delivery of advice to clients on all of their financial needs, a variety of complex accounts, more challenging asset quality issues and customizing services for clients.

¶ 240 Mr. Muccilli estimated Zari's loss of income based on two alternatives regarding her career path had she not been injured as a result of the fire. Alternative A assumes that Zari would have continued working at the CIBC and would have progressed from level 3 to level 5, earning the midpoint salary at each level commencing July 1, 1995 at level 3 at a rate of $31,800, moving on July 1, 2000 to level 4 at $37,800 and on July 1, 2005 to level 5 at $45,000. Alternative B assumes Zari would have continued working with the CIBC and would have progressed from level 3 through level 7, earning the midpoint salary range (for the entire period she holds that job) commencing July 1, 1995 at level 3, $31,800.00, January 1, 1998, level 4, $37,800.00, July 1, 2000, level 5, $45,000.00, January 1, 2003 at level 6 for $53,600.00 and July 1, 2005 at level 7 for $63,800.00. All of these salary figures are for full-time employment.

¶ 241 In my opinion the progress assumed in B is unrealistic. Ms. Mottram said she knew of seven people who had moved from level 2 to level 5 and that it was not unusual, but to move from level 2 to level 7 in 10 years would be very hard unless one was very, very motivated. Certainly in the higher levels the nature of the experience needed to move upwards would appear to require much more time to accumulate. While there is some evidence that the pre-fire Zari may have been of above average intelligence despite relatively poor marks in the course in evidence, there is no evidence that she would be regarded as a superstar to be pushed along rapidly. I also doubt if it is realistic in either A or B to use the mid-point of the salary range, since on these hypotheses she would not spend enough time in each position to make the mid-point represent an average given the modest annual advances within the ranges - 2 to 3% per annum - discussed in evidence by Ms. Mottram.

¶ 242 Alternative A also has its problems. The element that Ms. Mottram thought would be of great help to Zari in securing advancement was her taking courses. In early 1995 she had not completed the first course and not even applied for the second. Although some people had moved to level 4 without it, in Ms. Mottram's opinion the key to level 4 was the securities course. Nor had Zari applied for either full-time work or for promotion. To assume that she would have applied and been accepted as soon as July, 1995 seems unreasonably optimistic. I have no doubt that she could do the level 3 job and with her supervisor's support she had a good chance of getting it, but I think July, 1996 a more reasonable working hypothesis after she had finished a year of the second course (Securities). Level 4 in another 5 years - 2001 - is not unreasonable, but at level 5 we reach a change in emphasis toward managing the relationship and the inclusion of some small business customers. Typically the higher up one goes in a business, the fewer jobs and more applicants per job. There is no evidence about the situation at CIBC in this regard, but I assume that if it were not so, the plaintiffs' counsel would have told us. It would be reasonable to assume that promotion to level 5 would take longer and might not have been available even to an ambitious person. As compensation for the loss of the chance to compete for a level 5 job, I would notionally award Zari from 1 January, 2007 an increase in salary equal to one-half of the difference between the level 4 mid-point and the level 5 mid-point.

¶ 243 There is included in Zari's claim an amount for loss of the benefit of the Employee Share Purchase Plan. She had not made this investment, but it is assumed that it was such a good deal (CIBC contributed 50 cents for every dollar the employee contributed) that she was bound to do it. That is an unlikely assumption for Zari in 1995 with a dependent son and an income under $20,000. Perhaps by 2000, with Pedrum established and her income better, there would have been money for investment and I will allow this claim from Jan. 1, 2001 only.

¶ 244 A management fee is part of the claim. Mr. Muccilli said that 5% was a usual fee. It is submitted that there must be specific evidence that one is needed. I agree, but there is the evidence of Zari's condition which makes it plain to me that she will need help to manage the sums awarded to her so that they will in fact support her as they are intended to do. Indeed, in my opinion counsel should be considering whether these funds should not be paid into court or otherwise protected. I will fix the amount after Mr. Muccilli has done his work.

¶ 245 At the end of the trial it was agreed that Mr. Muccilli would be available to perform calculations based on the facts as I would find them and finalization of the amount of an award of lost income must await this work. At that time, I must consider whether the resulting sum ought to be adjusted for the impact of contingencies.

¶ 246 I turn to general damages. The trilogy 'rough upper limit' is now approaching $300,000, having passed through $260,000 in 1999 according to the plaintiffs; and is $275,000 today, according to the defendants. The defendants submit that Zari has the life skills to live alone, do her banking and shopping and possibly drive her car. She takes a course. She is a far cry from the trilogy plaintiffs. Her generals should not exceed $150,000 at the most.

¶ 247 In my view, the quality of Zari's life has been destroyed. She has been reduced from an independent, respected, confident, self-supporting, employed mother of two sons who looked to her for guidance, to an unemployable, unsociable, dependent person, no longer able to be the mother, rather now dependent upon her sons for her emotional support. Once she has done her banking and her shopping, she has no activities to stimulate her socially or cognitively. She does not travel for pleasure. Her course is a correspondence course, lacking in the give and take of a classroom. Her short-term memory is so bad she often has to re-play movies to pick up the plot. She has a similar problem when reading. She has reasonable health, except for her shoulder and neck pain (for which she goes to the gym occasionally) and a normal life expectancy, but she has severe cognitive deficits. It is true that she is in a better situation as to health than any of the trilogy plaintiffs. Nevertheless, the result of her injuries has devastated her former life. She has a reasonable possibility of coming to dementia earlier than she would have. Such a plaintiff is a candidate for an award towards the upper end of the scale: MacMillan v Ontario, [1998] O.J. No. 2763 (O.C.J.).

¶ 248 I assess Zari's general damages at $225,000

¶ 249 Zari's special damages are claimed at:

a) 82 hours of psychotherapy with Dr. E. Tahbaz at a cost of $8,200; I allow this;
b) Neuro-rehabilitation expenses at Columbia Neurorehab are allowed in the amount of $31,200, less any interest contained in that amount;
c) Treatment costs for cognitive therapy at Whitham Neuro Inc. are allowed in the amount of $20,848, less any interest contained in that amount;
d) Physiotherapy treatments at Line Troster are allowed at a cost of $119;
e) Various expenses consequent on attending on medical treatments were claimed in the amount of $6,722.76. Some were objected to - a parking fine and some pizza orders - and one was prior to the fire; Zari was in hospital for a long time and gas and parking in that period are clearly allowable, as are payments to various treating agencies. Rather than deal with each deduction separately, my review of the list leads me to allow this at $5,500;
f) a subrogated claim for special damages on behalf of the Ontario Health Insurance Plan in the amount of $46,281.06 for medical expenses incurred as a result of the injuries caused by the fire. Although the index to the joint books of Exhibits indicates the payment summary is included, it is not in my copy. This should be filed for my consideration.
g) a subrogated claim for special damages on behalf of the

Medical Services Plan of British Columbia in the amount of $423.85 for medical expenses incurred as a result of the injuries caused by the fire. I cannot find evidence that these expenses are related to the fire and I do not allow them.

¶ 250 In my view these costs are reasonable and incurred as a result of the fire. It was said that expenses incurred outside of Toronto were suspect, but I cannot think why they should stand on a different footing from Toronto expenses. The therapy treatments were an effort to mitigate and there are any number of medical recommendations for therapy. I do not accept that Ms. Whitham's fees for therapy should be disallowed, her experience with the brain-injured may well have been of help to Zari.

Injuries II: Pedrum:

¶ 251 The real issues in dispute regarding the assessment of Pedrum's damages as seen by the plaintiffs are:

(1) The plaintiffs assert that Pedrum's learning and his earning capacity have been impaired by his mild but permanent injury.

(2) The plaintiffs assert that there is a probable risk that Pedrum will suffer early onset dementia and or epilepsy and that this risk should be reflected in his award of general damages.

¶ 252 Pedrum was a 20 year old Grade 13 student at Northern Secondary School at the time of the fire. His intention was to attend Clarkson University in the United States to pursue Aerospace Engineering. There is considerable evidence that pre-fire Pedrum was of above average intelligence. When the family left Iran they went first to Turkey. Zari said that Pedrum, then 9, swiftly learned Turkish and could translate for the family. He then did the same thing in English in a few months when they moved to Canada.

¶ 253 He began his Canadian education in Grade 4. He did well. When they moved to 2 Forest Laneway he enrolled at Northern Secondary School. His secondary school marks are in evidence. His English marks were consistently between 67-75%; his mathematics marks were better, ranging from 70-90%. He took a number of courses in subjects related to engineering - electronics, computer technology, automotive mechanics, applied electricity - and scored mainly above 75% and up to 94% in this type of course. In Grade 13 in the fall of 1994 he was enrolled in two co-op courses where he worked at Downsview Canadian Forces Base with pilots. He received marks of 94% on these courses. His reports are peppered with descriptions of him as a sincere, serious student who worked hard and was a pleasure to have in class. His June 1994 report shows marks as follows:

Keyboarding	88	(course average 69)
English	67	(course average 67)
Mathematics	78	(course average 68)
Chemistry	75	(course average 66)
Auto Mechanics	94	(course average 57)
Electronics	77	(course average 69)
Photography	83	(course average 71)
Personal Average	80	66.7

While this is not an outstanding record, it is clearly an above average one by a good margin.

¶ 254 Pedrum's fall 1994 Grade 13 marks show the 2 co-op courses at 94% each, well above the course median. His other marks were less impressive than his Grade 12 results which he told Dr. Cancelliere he thought was related to having more 'on his plate'. He is shown as absent 21 days in the fall term which could also be a factor. Dr. Travis described this fall 1994 record as mediocre and not indicative that Pedrum would likely gain entrance to graduate work in Engineering. In cross-examination, he conceded he did not know that Pedrum was out of the school 2 days a week doing the co-op courses; or that his overall average in the fall of 1994 was 77%; or that he was taking Physics at night. He was aware that Pedrum had a part-time job. He said it was important in assessing Pedrum to focus on the 'core' courses. If one accepts that invitation and focuses on English (except Co-op which was called "English 4A5" on the report), Mathematics, Science, Physics and Chemistry, one finds that Pedrum averaged 75.9% in these subjects from Grade 9 to Grade 12. This puts his marks in the fall of 1994 in a larger perspective. Pedrum was injured at a time when his maturation was not complete. His marks were variable but he showed that

when his interest was engaged he was capable of superior work. I conclude that pre-fire Pedrum was an above average student capable of attending university and that it was a reasonable possibility but not certain that he might be able to do graduate work.

¶ 255 When the dense black smoke caught up with Pedrum and his mother, he lost consciousness on the 30th floor. He was found unconscious there by the fire fighters and taken to the lobby and revived, but lost consciousness again, at least to some extent, as he remembers only part of the trip in the ambulance to the hospital. He received oxygen through a nasal tube. He testified he was at the hospital emergency for 9 hours and spent a couple of hours in the hyperbaric chamber. He felt as if he had awakened from a 10-year sleep. His eyes had been chemically burned and he was treated and bandaged for three days during which he could not see. There has been no permanent damage to his eyes. He went to his father's home to be cared for and there he learned that his mother was still alive. He did not learn that she was in a coma until several days later when, the eye patches having been removed, he was able to go to see her. When he saw her, he was shocked, numbed and emotionless; he stayed with her every day as long as he could and some nights he spent on the floor of her room.

¶ 256 In the days immediately after the fire, Pedrum made diary entries which are summarized in the report of Dr. Travis of 8 March 1999. Pedrum wrote of being trapped and of his mother's panic in the stairwell, of his fears that she was dead, his pain - agony - at the time of losing consciousness, nightmares about choking to death in the stair, self-blame over failing to protect his mother, his distress about his blindness and his extreme fatigue. The note dated January 8 indicates he learned that his eyes would recover and that Zari was in a coma and reflects his anxiety over her recovery.

¶ 257 In his trial evidence, Pedrum described his injuries. He had recovered from the burns to his eyes. He had on-going emotional and psychological problems in dealing with the fire events and occasional self-destructive thoughts. He had short-term memory problems including difficulties with mental arithmetic and recall of names, things he could do with ease previously. He learned to cope by making lists, a technique that he still has to follow and had not had to do before the fire. From 1995 through 1997 he had many sleepless nights, flashbacks, nightmares and headaches and he still is not completely free of these problems. Flashbacks in class destroy his concentration. He had some psychotherapy but could not complete the program for lack of money. For some four years he was emotionless and in a kind of fog from which he has now emerged, perhaps because of the move to Victoria, B.C. He described himself as very angry about the fire. His previous relationship with his mother was reversed. He had gone to her for advice and help; now she comes to him instead and he finds himself making decisions for her. The mother he knew is gone.

¶ 258 The neurologist, Dr. Weber, also testified about Pedrum whom he first saw on November 24, 1995. He felt that Pedrum had shown early symptoms of neurocognitive deficit including reduced facility with numbers and with word-finding and easy fatigability precipitated by mental tasks. Such fatigability often accompanies migraine headaches and Pedrum had four severe headaches since the fire which had migraine characteristics. The stress of the fire may have aggravated minor pre-existing migraine.

¶ 259 An EEG was done and Dr. Weber summarized the results in his report of December 19, 1995. Pedrum's results were borderline abnormal record with mild diffuse slow features that could reflect the effect of drowsiness not detected by the EEG technician (the technician observed the patient to be awake). Such diffuse slowing can also reflect a toxic or metabolic cerebral disturbance.

¶ 260 In January 1995, Pedrum was seen by Dr. Leigh Solomon, a psychiatrist, who diagnosed Post-Traumatic Stress Disorder and in June 1995 by Dr. Tahbaz who diagnosed severe depression and projection of blame, anger and hostility as well as PTSD.

¶ 261 Not long after the fire, Pedrum wrote an examination in a course he had taken before the fire and did well. However, he left school that winter finding he could not cope with the demands of his course work and family upheaval. He returned to Northern Secondary School in the fall of 1995 and completed grade 13.

¶ 262 He attended Carleton University in Ottawa from September 1996 until December 1997, working towards an engineering degree. His marks were not good. He obtained only 5 credits out of 10 required. He testified that he had a lot of emotional difficulties there. His contacts with his mother, who was at first still in Toronto, were very discouraging; she was lonely and depressed. In class he would have flashbacks of the fire which

destroyed his concentration. He decided to shift to Mechanical Engineering and to move to western Canada. He applied to the University of Victoria but was required to upgrade his academics. He therefore enrolled at Camosun College. In August 1999 he and Zari moved to Victoria, B.C. At Camosun he did well, taking 6 courses and achieving 2 A+, A, A-, B+ and B marks. He was admitted in the fall of 2000 into the second year of Mechanical Engineering at the University of Victoria. At the time of the trial he was in the co-op portion of the year, working in industry. He said his marks had been B+ to B-.

¶ 263 As with Zari, Dr. Upton gave the most comprehensive medical evidence about Pedrum whom he examined and interviewed on August 26, 1998. Pedrum was then still at Carleton and described himself as passing but not up to his standard. In his report of August 26, 1998, Dr. Upton wrote:

> "Pedrum Sodouri has a history of a significant head injury in Turkey when he was 11 years old".
> head hit sidewalk
> Basal skull fracture
> Period of unconsciousness
> Subsequent dizziness
> This predisposed him to develop increased problems from any further head injury or hypoxia.
> He tried to save his mother who suffered significant smoke inhalation, hypoxia and probable carbon monoxide poisoning with permanent residual effects.
> Pedrum Sodouri was unconscious when he was found. He was unresponsive with a Glasgow Coma Scale Score of 3. (NB: The Glasgow Coma Scale score is 3 to 15 where 3 is near death and 15 is normal).
> It is probable that he suffered a combination of:
>
> (a) Smoke inhalation:
>
> - Nose
> - Throat
> - Brachia
> - Lungs
> - Burns of his corneal surfaces in his eyes.
>
> (b) Hypoxia:
>
> - a reduction in the total oxygen saturation of his blood.
>
> (c) Carbon monoxide poisoning:
>
> - His carboxyhaemoglobin was 10%. Carbon monoxide has about a 230 times affinity for haemoglobin in comparison with oxygen. The bond between carbon monoxide and haemoglobin is essentially irreversible and the haemoglobin is broken down and remanufactured by the body.
>
> In my opinion, it is improbable that he was unconscious due to 10% carboxyhaemoglobin. It is the combination of smoke inhalation, hypoxia and carbon monoxide poisoning that rendered him unconscious.
> It is improbable that the carboxyhaemoglobin levels changed significantly on the way to the hospital.
> It is probable that there was a delay in putting him in a hyperbaric oxygen chamber. This increased the probability of brain damage from the smoke inhalation, hypoxia and carbon monoxide levels.
> He suffered a number of typical post-hypoxia (and post carbon monoxide poisoning changes which produce hypoxia) effects including: Headache, Depression and anxiety, Reduced concentration, Reduced memory, Fatigue and Dizziness
> The effect of the hypoxia acted on the residual effects of his head injury.
> He developed psychosocial, financial and stress problems resulting from the fire. He had to look after his mother. He required multiple psychotherapy sessions to reduce his anxiety and to increase his self-confidence.
> He has done everything to mitigate his losses and the effects of the fire.
> He has returned to school.
> In my opinion, he is a bright and intelligent young man. However, it is probable that he has suffered some long-term (permanent) effects of the hypoxic episode acting on his residual effects of his head injury at the age of 11. He describes reduced memory, reduced concentration and some word finding problems.

I believe that these problems are real.
He continues with his courses. It is very difficult to estimate a percentage loss of cognitive function related to the fire because of his excellent residual intelligence and cognitive skills.
* * * *
In my opinion he is at risk of developing an earlier dementia than would have been in comparison with the probability before his hypoxia episode. (underlined in original)

¶ 264 Dr. Upton returned to the subject of future impairment in his report of October 7, 1998 at page 1480:

In my opinion the degree of future impairment will probably be between 10 to 20%. Since he has chosen to be a consulting aerospace engineer, this is a significant disability."
"A major problem is that there is evidence that brain damage due to trauma or hypoxia increases the probability of earlier onset of a decline in mental abilities or dementia."

¶ 265 Dr. Upton expanded on this opinion in his report of November 23, 2000 at page 1482:

"He returned to school and he seems to have made maximal efforts to mitigate his losses. However, he had continuing symptoms when he saw Dr. Travis. Dr. Travis accepts that Mr. Sodouri made good efforts in the tests and it is my opinion that it is probable that his previously superior abilities have been significantly reduced and this has had an important and continuing effect with residual sequelae of the accident of January 6, 1995. These effects will reduce his potential to start and maintain his own aerospace company and it is probable that the negative effects on employment, earning potential and enjoyment of life will be permanent."

¶ 266 As with Zari, Dr. Stewart testified for the defence. His opinion on the prospect of Pedrum's developing an early onset dementia in comparison with the probability that existed before his hypoxic episode, was naturally the same: t he literature did not support the possibility to the necessary degree of scientific certainty. There is no need to repeat the analysis already undertaken. On this point, I accept the opinion of Dr. Upton in preference to that of Dr. Stewart.

¶ 267 Pedrum was also seen by Dr. Butler on June 25 and September 14, 1998 and on November 25, 2000. Dr. Butler described him in September 1998 as presenting himself in a distant way preventing emotional engagement with the observer. He was doing his best to accept what had happened, while having difficulty doing so. Dr. Butler continued:

He is a bright man who hopes to become an Aeronautical engineer. In January, he will be moving to California where he is to attend a University in San Jose. He tells me that he is not doing awfully well, he has failed some subjects and is far too preoccupied to be able to concentrate properly.
Mental State. He is neatly dressed, his appearance is immaculate, he is precise and correct in his manner. He displays no emotion but responds courteously, if slowly. There are often times when I had to wait for several seconds before he replied to a simple comment or question. He speaks from a realistic frame of reference.
There is some psychomotor retardation. The content of his thinking is largely of worry about his mother and his own future, about his losses and about the inability to bring closure to this unpleasant part of his life because of the litigation process. His fund of knowledge was above average and his vocabulary in keeping with that, but his ability to use this to abstract principles or to do simple calculations was surprisingly inadequate. He is vaguely aware that he is emotionally constricted. He is aware that his judgment is somewhat affected by denial and avoidance."
* * * *
He suffers from a chronic post-traumatic stress disorder which at this stage has an 80% chance of continuing indefinitely. This will significantly affect the quality of his life. It could also affect his ability to study significantly. His relationships will tend to be shallow or protective but not healthy or enhanced by mutual sharing. He will be nervous, highly strung person who will be preoccupied, unable to devote his full attention to whatever he does. This state of affairs is the result of the fire as well as the subsequent carbon monoxide poisoning."

¶ 268 Pedrum was seen again on November 29, 2000 by Dr. Butler who wrote:

Mr. Sodouri is mainly preoccupied with the need to take care of his mother who has changed from being his protector and caregiver to needing the same service from himself. He has described how she is unable to organize her life adequately, is remote, afraid and disabled. Nevertheless, he had hoped to continue his studies in Aeronautical engineering and had described high ambitions. He has moved to Victoria with his family and is now enrolled in the University of Victoria.
He has, in fact, not done nearly as well as he had believed he would. He had to go back to a Community College since his marks from Carleton were below the standards for Victoria. He says he is doing quite well in his laboratories but not too well in the written work now. He continues to emanate feelings of success and distinction.
While the acute symptoms of the Post-Traumatic Stress Disorder have largely been displaced by the mechanism of denial, avoidance and other psychological defences, he continues to be a somewhat remote figure with chronic underlying anxiety and emotional constriction as the principal residues of the experience of the fire which is documented at the Toronto General Hospital and other reports including my own of September 1998. Having to supervise the activities of his mother's daily life, is an added handicap.
Mr. Sodouri's condition is chronic. There will be no substantial change now. He will continue to be handicapped by the consequences of the fire of January the 6th, 1995.

¶ 269 Dr. Keith Travis, consulting psychologist, examined Pedrum for the defence in March 1999 in Ottawa, while Pedrum was attending Carleton. He did extensive testing of Pedrum and observed that his test findings were, in most respects, similar to those reported by Dr. Tahbaz (who had treated Pedrum for a number of months until he could no longer afford it). Dr. Travis noted in his report Pedrum's complaints of psychosocial problems, financial stress, of feeling like a parent to his mother, reduced memory, problems with his concentration, and problems with word finding. Like Dr. Butler, he observed that Pedrum's mother's problems appeared to be of more concern to him than his own problems. Zari was no longer the parent figure.

¶ 270 Dr. Travis concluded that Pedrum was not over-reporting his complaints. He also noted Pedrum's complaint of fatigue. He stated in his evidence that this complaint could be as a result of asphyxiation, hypoglycaemia, anxiety, psychological trauma, or even trauma to the brain. He agreed that the fire likely caused the symptom of fatigue in Pedrum. He acknowledged that many victims of such events have complaints of fatigue.

¶ 271 Dr. Travis made special note of Pedrum's report of diminished concentration and inefficiency of memory which he found equivocal, as they could be explained by other factors. In chief he elaborated on this, stating that because of Pedrum's general adequacy on the tests, he had difficulty relating to the concept of a 10 to 20% slippage in cognition due to neurological factors. He did however concede that he would defer to the neurologists on the point. This was explored with him in cross-examination where it was established that his own observations supported Pedrum's report of word-finding problems. There were several reasons why Pedrum might have these symptoms, including post-traumatic stress disorder, the accident in Turkey at age 11, (this was more remote) and organic brain injury. He acknowledged that Pedrum's symptoms could be a result of an accumulation of all the potential causes, possibly including, as a neurological matter, the long-term effects of hypoxia acting on the results of the incident in Turkey. He agreed that there is a medical consensus that Pedrum's Turkish episode predisposed him to greater injury from subsequent brain insults.

¶ 272 Dr. Travis said in cross-examination that Pedrum's anxiety context scale was moderately elevated. This demonstrated that he had some residual anxiety and loss of self-esteem. The Trauma Symptom Inventory showed evidence of residual psychological trauma, defensive avoidance of facing his problems; avoidance of social contact; and mild but significant anxiety. He demonstrated autonomic hyper-arousal, and other symptoms of anxiety. All of Pedrum's complaints were consistent with an impairment of a permanent nature of a mild degree, with continuing evidence of post-traumatic stress disorder and of other emotional sequelae as a result of the fire. Some cognitive rehabilitation could still be useful.

¶ 273 Dr. Cancelliere also testified about Pedrum whom he first met in 1995 in the course of his investigation of Zari's condition. He interviewed Pedrum to assess him only in December, 2000. At that time he reviewed the report of Dr. Travis. In his report he was mildly critical of some of the tests that Dr. Travis had used. The WAIS-R intelligence assessment test was outdated and use of the modern one would have produced lower scores for Pedrum. He also noted that the Rey Auditory Verbal Learning Test

results were not within normal limits, as per Dr. Travis, but were at the lowest end of the low average range. (Dr. Travis conceded in his cross-examination that this score revealed "relative weakness" in memory.)

¶ 274 Dr. Cancelliere stated in his report and his evidence that Pedrum's continuing symptoms will continue to compromise his functional ability to some extent. Considering his CO poisoning and significant period of anoxia, one would expect a limited or subtle influence upon neurocognitive capacities. His report illustrated these impairments and he concluded that, while it was possible that Pedrum had recovered, the current information was more consistent with long-term or permanent effect to a mild degree.

¶ 275 Returning to the evidence of Dr. Stewart for the defence, on the question of the extent of Pedrum's injuries (apart from future early onset dementia), he based his opinion on reviewing the available reports, but seems to have been primarily influenced by those of Dr. Travis and Dr. Sitwell (who did not testify). He said that he disputed that there was any impairment of intellectual capacity, but when shown the findings of Dr. Cancelliere, he conceded that it was much worse than what was described by Dr. Travis, and that, although Dr. Cancelliere described the impairment as "mild", his findings showed significant impairment. He sparred with counsel over the influence of fatigue on these tests but said again that the results were worse than "mild"; they were significant results for what he regarded as a low degree of CO poisoning - 10% carboxyhaemoglobin.

Damages Pedrum:
II:

¶ 276 In my opinion the weight of the medical evidence - Drs. Butler, Cancelliere, Upton and Weber and to some extent Dr. Travis and also Dr. Stewart in cross-examination - supports the view that Pedrum has suffered permanent, although mild, cognitive deficits as a result of the fire in which he experienced 10% CO poisoning, a significant period of hypoxia and smoke inhalation, all of which contributed to his impairment. There is a possibility, which I regard as a real possibility, in the order of 10%, that at some future time he may experience some degree of dementia perhaps five years earlier than would have been the case absent the fire. He almost certainly retains sufficient intellectual capacity to achieve an engineering degree, but his career may suffer. He will actually never know. I deal elsewhere with the economic consequences of that, but this is the place to consider the frustrations engendered by it. Apart from intellectual function, the emotional/psychological consequences of the fire for him have been severe, altering his personality, restricting his ability to engage in a full social life and burdening him with chronic anxiety and emotional constriction. In considering the quantum of general damages, I also must recall the experiences of the day itself, apart from the sequelae: the terror, the pain and suffering of the hospital stay and the immediate as well as long term disruption of his life. I assess his general damages at $100,000.

¶ 277 The plaintiffs submitted that, as Dr. Upton had estimated Pedrum's impairment at 10-20%, the challenge was to translate that into dollars and they made some estimates of Pedrum's pre-morbid IQ and its reduction and the dollar consequences of such a percentage reduction in income. I think that the effort to translate such a prediction into lost future income in a mathematical way is unsound. It is not a mathematical problem; there are innumerable contingencies, good and bad, that might affect him in the future and might or might not have affected him absent the fire. As a general statement, it may well be true that higher intelligence generates additional income, but there is no evidence that the relationship is linear or that relatively small differences are economically significant. Motivation, willingness to work, sufficient good health to enable maximization of one's abilities and the good luck to be in the right place at the right time all play a role in most of our lives and may be expected to play a role in Pedrum's future.

¶ 278 That is not to say that no assistance can be derived by examining the sort of figures presented by the plaintiffs. Jim Muccilli, M.B.A., C.A., is a Principal in the Business Valuation and Litigation Advisory practice of Arthur Andersen and is well qualified to assist the Court on the mathematical aspects of this problem. He prepared his report largely upon assumptions given to him by plaintiffs' counsel. Some key assumptions were that Pedrum would have entered University in the fall of 1995 and this was deferred for a year by the fire; that he was unable to carry a full load and would graduate four years later than he would have; that he would have earned 10-20% above the average engineer's income during his career but for the impairment; and that the average engineer's income was, and would remain $70,000 per year in 2000 dollars.

¶ 279 Based on these assumptions, Mr. Muccilli estimated Pedrum's future loss of income on three bases. Alternative A assumes that he would have earned 10% above the average but for the fire; B that he would have earned 20% above average; and C that he would have become an

aeronautical engineer whose average income would have been $80,000 per year.

	A	B	C
Income without the fire		(millions)	
January 1, 2001 - May 31, 2040			
Present value	1.82	1.99	1.89
Less: Income post fire including $38,000 earned during the engineering co-ops			
Present Value	1.47	1.47	1.47
Present Value of Future Loss	.348	.514	.419

¶ 280 I don't accept the assumption on which C is based as Pedrum decided to switch to Mechanical Engineering for the wider opportunities it offered. The plaintiffs urge B on me as the fairest. It presupposes that the pre-fire Pedrum would have likely earned well above the average engineer. We are dealing with a person injured at the age of not quite 20 and in high school, his maturation by no means complete. He was, as I have found, an above average student. His pre-fire marks are not consistently so high as to give the impression that he was then a truly superior student, although some were very high indeed, apparently when his interest was engaged as in the aeronautical co-op. Since the fire, his Carleton marks are not a reliable guide to his possible impairment. He was distracted by the then recent events of the fire and by worry over Zari and he was, as he said, in a fog that only lifted when they moved to Victoria. There is strong reason in the evidence to think that the pre-morbid Pedrum would have continued to do better than average, but I don't accept the 20% impairment assumption as fair. The 10% impairment assumption underlying A is probably closer to the mark, but, as noted above, I do not accept that there is a linear relationship at work here. Once a person has achieved a university education, he has passed through the most significant income-differentiating factor. A somewhat better degree and a marginally better ability to concentrate, etc. may or may not become a factor in a long-term career. There is certainly a real possibility that Pedrum's career may be significantly affected and I should attempt to make a fair assessment of that possibility, given that we cannot wait and see. All things considered, I assess the present value of his future loss of income due to the fire at $250,000.

¶ 281 Pedrum's past loss of income as calculated by Mr. Muccilli is problematic because he has assumed that Pedrum would start his working life as an engineer at the average salary for all engineers. The better choice would have been the median starting salary at which level it appears that there would be no loss.

¶ 282 Pedrum's FLA claim for loss of the care, guidance and companionship of Zari is not included in the assessment of his general damages. It is clear that he and Zari had a very close relationship which has been reversed by the fire. Pedrum has become the one who gives care, guidance and companionship. Zari can now give very little back. I assess this loss at $40,000.

¶ 283 Pedrum's special damages were shown as $3559 for the courses at Camosun and treatment by Dr. Tahbaz, none of which would have been incurred absent the fire. OHIP's subrogated claim of $2176.67 is also allowed. Objection was taken to services rendered in B.C. at a cost of $310.47 as "suspect", but I do not see why they stand on any different footing than expenses incurred in Ontario. His eyes were injured in the fire; he saw an optometrist in B.C.

Damages III: Pejman

¶ 284 Pejman Sidouri has an FLA claim for the loss of care, guidance and companionship of both Zari and Pedrum. He was born in 1969 and has lived with his father since the parents separated in 1991. This was evidently a question of the father needing him; he remained close to his mother. He suffered emotionally through the long period of Zari's hospitalization. The fire caused him to postpone a planned move to the U.S. for career purposes and to return from that move prematurely. After Pedrum moved to Ottawa, Zari was alone for a while and then came to California in November 1996 to visit Pejman and her sister. Pejman was surprised at Zari's personality

changes. When she returned to Toronto after a quarrel with her sister, he moved back to be with her in early 1997. Like Pedrum, he has reversed roles with Zari and is now an advisor and comforter to her. Since Zari and Pedrum moved to Victoria, Pejman has visited them four times for periods from two to four weeks each time. This relationship was also a close one and I do not propose to compare it minutely with Pedrum's. The two sons have similar losses in relation to their mother and I assess Pejman's FLA claim in respect of Zari at $40,000. Pejman also has an FLA claim relating to his relationship with Pedrum. On the whole, at present there does not seem to be any adverse impact upon the relationship that can be traced to the fire. That life has carried them to different cities with reduced opportunity for contact is normal. However, at the time of the fire and for some years after, Pejman certainly suffered the loss of the brother he had known while Pedrum lived through his time "in the fog". I assess Pejman's loss in respect of Pedrum at $10,000.

¶ 285 It was submitted that Zari should receive an FLA award although counsel recognized that, if anything, her degree of companionship and care from Pedrum had increased and he had become one of her guides in life. It was said that Zari should be compensated for the reversal of roles. I agree and I have already included that factor in assessing her general damages.

¶ 286 There will be judgment in accordance with these reasons. The matters on which further information and submissions are to be made, as noted above, will be dealt with either in writing or at a hearing to be arranged. Counsel should contact my assistant, Ms. Polly Diamante, in due course to arrange a conference to discuss the arrangements. Costs and interest can be dealt with after all outstanding matters are completed.

¶ 287 It would be wrong to part with this case without expressing my gratitude to all counsel for the professional skill and welcome courtesy with which this long trial was conducted.

LANE J.

Calicloth Textiles Inc. v. Smith Falls (Town)

Between
Calicloth Textiles Inc., Spidertex Inc. and Arko Textiles Inc., plaintiffs, and
The Corporation of the Town of Smith Falls and B. Poole Structures Limited, defendants

[2001] O.J. No. 4946
Court File No. 96-CV-100668

Ontario Superior Court of Justice
Manton J.

Heard: September 4-7 and 11-13, 2001.
Judgment: December 12, 2001.

Counsel:

Brian Parnega, for the plaintiffs.
David R. Neill, for the defendant The Corporation of the Town of Smith Falls.
Steven Stieber, for the defendant B. Poole Structures Limited.

¶ 1 **MANTON J.**:— This action was heard by me on the above dates and my decision reserved until today.

¶ 2 The Plaintiffs resolved all the issues with the Defendants and agreed to pay them the sum of $2,175,000.00 including interest and costs after taking into consideration the contributory negligence of the Plaintiffs. I am to apportion liability for the payment of this amount between the two Defendants.

¶ 3 The facts as stated in an agreed statement of facts filed as Exhibit 1 are as follows:

1. The Plaintiffs are all textile companies, whose principal is Balu Kuriya and as of March 14th, 1993 all of the Plaintiff companies were housed in a building located at 9 Hershey Drive in Smith Falls, Ontario.
2. In 1993, the building was owned by the Plaintiff Calicloth Industries (Calicloth) and the two other Plaintiff corporations were tenants in the same building.
3. On March 14th, 1993 at approximately 4:00 a.m. the roof of the building collapsed under a build-up of snow and this claim is for resulting damages sustained by the Plaintiffs.
4. The building was originally constructed in 1973. The Town has not been able to find the original plans. The Building Inspector in 1973 was Charles Yellen and he remains as the Building Inspector to this day.
5. The Town acquired the building for unpaid property taxes in 1981 and Town passed a by-law that authorized their acquisition of the property. The Town's own documents at that time indicate in interdepartmental memos that the Town was concerned about the roof support system.
6. The Town considered that it ought not to acquire the property without either a Ministry of Labour Safety Certificate or demolishing the building altogether, but did neither.
7. The Town set aside approximately $66,000 for repairs and retained a firm of professional engineers, Adjeleian and Associates to inspect the building who prepared a report dated September 14, 1981.
8. Remedial work was done by the Town in 1981 prior to its first tenant taking occupancy. The Town does not have copies of any written contract with the contractor who did this work or the plans for it. Nor do the Building Inspector and the Town Engineer who was in charge of the project have any files, notes, records or inspection reports.
9. Once the work was done, the Town Engineer and Director of Economic Development delivered a report which stated that:

   (a) Structural repairs carried out in portion of the building only.
   (b) The other areas (office areas, and the unleased areas) have not had any structural reinforcement and are also deficient.
   (c) There were concerns about the structural capacity of the outside walls.

(d) Much of the work during original construction was done in a slipshod manner using the cheapest materials. Deterioration due to weathering and ageing will mean high maintenance costs. It will be important to keep the building from totally deteriorating.

10. The Town subsequently budgeted $60,000 for further repairs to this building but that money was never used for such repairs.
11. In early 1985 the Town listed the building for sale.
12. The Town obtained an opinion from Rivington Associates, a Real Estate Appraiser as to the property's fair market value, which opinion was dated June 11th, 1985.
13. The building was empty at the time the Town had it for sale in 1985.
14. At that time in 1985, the building had an area of approximately 20,000 square feet and was 120 feet by 160 feet with the latter dimension being the frontage.
15. In 1985, Mr. Kuriya called the Town to confirm that the building was for sale.
16. Calicloth purchased the building on September 13th, 1985 for $85,000.
17. In 1987, the Plaintiffs added to the building which addition had approximately the same dimensions as the building, (120 by 180 feet) and was designed to run along the north side of the building. (north side)
18. The Plaintiffs entered into a contract with the Defendant B. Poole Structures Limited (the Defendant Poole) for the construction of the 1987 addition.
19. This structure had a height of 14 feet and a peaked roof that had a pitch, unlike the original roof which was flat. The total cost of this addition was $425,200.
20. The Plaintiffs contracted with the defendant Poole to construct a second Butler building addition in 1990 at a cost of $500,700. (14' had a pitch by 120 x 180) i.e. (same dimension as para. 17 west side).
21. Mr. Poole is the President and sole Shareholder of the Defendant Poole. He resides at R.R. #5, Perth with his wife who is the Secretary of the Company.
22. Mr. Poole has been in the construction business for approximately 40 years and has been operating the Defendant Poole for the last 25 to 30 years.
23. The Town was not provided with any engineering opinion as to the integrity of the roof, vis a vis an increased snowload.
24. "Engineering costs" were included in his Poole's contract prices.
25. With respect to the second addition, an engineer had been retained by Poole, but not to provide any inspection services and did not provide any "as built" drawings.
26. Poole understood his contract documents for the erection of this building to mean that it was up to him to insure that there was no excessive snow load on the original building.
27. Poole was on the roof of the original building on one occasion, between the second addition in 1990 and the collapse in 1993 at which time there was nothing about the roof that gave him any concern.
28. The two Butler building additions were placed adjacent to the unreinforced partitions of the roof.
29. Poole and McLean, his engineer with respect to the first addtion (sic), had noticed the reinforcing in the original building but had not been concerned about the fact that the entire roof had not been reinforced.
30. The unreinforced portions of the roof collapsed.

¶ 4 The position of the Defendant, The Corporation of the Town of Smith Falls (the "Town") is that the roof of the original building collapsed on March 14th, 1993 after a heavy snow fall because of the negligence of the other defendant which negligence consisted of not reinforcing part of the roof on the existing building at the time the two additions to the existing building were constructed. The position of the Defendant B. Poole Structures Limited ("Poole") is that the roof of the original building collapsed after a heavy snow fall because of the negligence of the Town which negligence consisted of reinforcing only part of the roof on the existing building when they knew that the whole roof was deficient and selling the said land and building to one of the plaintiffs without disclosing to the purchaser the fact that only part of the roof was reinforced and issuing a building permit for each of the two additions to the building notwithstanding the fact that the snow load capacity on the existing building as a result of these constructions was not indicated on the plans prepared by the professional engineers.

¶ 5 The original building was constructed in 1973. The municipality cannot find the plans filed in order to obtain a building permit for this construction although Charles Yellen ("Yellen"), the deputy building inspector at the time for the Town, said that a building permit was issued on October 17, 1973, and that one Masika was the engineer who drew the plans for the building. Yellen said he visited the building while it was being constructed in his capacity as deputy building inspector.

¶ 6 After the Town became the owner of the property in 1981, they requested J. Adjeleian, a professional engineer, to assess the structural integrity and safety of the building. An engineer by the name of Juan J. Salinas ("Salinas") made an inspection and prepared a report making the following recommendations.

1. Present roof membrane and joist system should be reinforced or replaced by an adequate system consisting of parallel chord wood roof trusses and insulated roof.
2. Upper four-foot part of south wall should be reinforced by installing 1" x 4" diagonals.
3. Knee bracing to be provided between joists and plywood beams. Cross-bracing to be provided between roof joists.
4. Lateral bracing to be provided by interior walls.

¶ 7 Salinas proposed the following remedial work:

1. Present roof to be reinforced by a system of secondary beams (MK 2) spanning 20 feet in the direction perpendicular to existing Queen Post Joists. These secondary beams, spaced at 8 ft. on centres are nailed to and support the top chord of the Queen Post Joists. These beams consist of 12" open web steel joists supporting a load of 350 p.l.f.
2. Secondary beams are supported at each end by main trusses (T1) with a span of 24 ft. These main trusses (steel) consist of 26" overall depth with specially designed supports at the plywood beam or at the wall.
3. Main truss column support (MK 3) consists of an especially designed assembly of two standard 8" channels attached to the existing columns by two 1/2" plates. This assembly also incorporates two 2" x 8" pieces of lumber on each side of the plywood beams and running down along the column in order to provide lateral restraint.
4. Main truss wall supports (MK 4) consist of two 2" x 8" attached to the 2" x 4" stud in the stud wall and three 2" x 6" nailed on each side of the 2" x 8" and the whole assembly being boxed by 1/2" plywood and capped by a 2" x 6". These supports, integral with the existing wall, will also contribute to its stiffness.
5. Special secondary beam wall supports (MK 5) are provided along the East wall.
6. In order to provide overall lateral stability to the structure, interior walls must be constructed. These will consist of 2" x 4" stud walls with 1/2" plywood sheathing (wall W1) in the North-South direction.

   These walls must be at least one bay (24 ft.) long, but preferably two (48 ft.). Their position would be along column line, 40 ft. and 80 ft. from the East wall. Alternate location or size of interior walls must be discussed and approved by a professional engineer.

7. Top portion of South wall must be reinforced by 1" x 4" diagonals spanning over 4 studs.

¶ 8 It is unknown what remedial work was done. All that is known is that some remedial work was done, including the reinforcement of the roof on part only of the existing building. Other than the preparation of the report, Salinas was never called upon to do anything else and was not aware that the roof was reinforced until a short time before the trial of this action. Although a building permit was required to do work to reinforce part of the roof of the existing building none was ever obtained by the Town, and no plan signed by an engineer was ever filed with the municipality to do this work.

¶ 9 Lucien Lalonde ("Lalonde"), the Director of Economic Development for the Town, said that he had concerns regarding the building. When asked why only part of the roof was reinforced, he said it was because only part of the building was rented by the Town to prospective tenants and if the business expanded then the Town would look at reinforcing the other part of the building. After the Town had made the repairs to the building, Lalonde sent a memorandum to the mayor, councillors, the clerk administrator, and the director of engineering, reporting the following:

a) structural repairs carried out in a portion of the building only. The other areas (office areas, and the unleased areas) have not had any structural reinforcement and are also deficient.
b) the roof membrane will likely need replacement in the very near future, consideration could be given to adding insulation at that time.
c) there are concerns about the structural capacity of the outside walls. One section of wall was observed to buckle when load was transferred to it from a temporary ceiling support. These walls should be reinforced with cross bracing or plywood sheeting were (sic) possible.
d) much of the work during original construction was done in a slip-shod manner using the cheapest materials. Deterioration due to weathering and aging will mean high maintenance costs. It will be important to keep the building from totally deteriorating.

¶ 10 In 1985, the Town sold the property to one of the Plaintiffs, Calicloth Textiles Inc. without informing the purchaser of the existence of the investigation and report made by Salinas and the concerns of Lalonde. In 1987, an addition was constructed on the north side of the existing building by the Defendant Poole. In 1990, a second addition was built on the west side of the building by the same Defendant.

¶ 11 Before the construction of each addition, plans were prepared by a professional engineer and these plans were reviewed by the Ministry of Labour for the Province of Ontario. The contract for the construction of each addition provided for payment by the Plaintiff owner to Poole for the service of a professional engineer, including engineering site work. A building permit was issued by the Town for each of the additions notwithstanding the fact that the snow load capacity for the existing building was not indicated on the said plans.

¶ 12 Several engineers were called as expert witnesses by the Defendants. Anatola Kornachuk is a professional engineer specializing in structural design. He attended the site on March 15, 1993, the day after the roof collapsed. His evidence is that the inspection of the damaged roof immediately revealed that the roof supporting system contravened the basic principles of elementary structural engineering. He also said that the two locations where the roof most recently failed were found in the part of the existing building where the roof was not reinforced. He concluded that the three factors that played a part in the roof collapsing were:

1. The recent plant additions in 1987 and 1990.
2. The roof structure in the original building contained fundamental design flaws.
3. The building deterioration.

¶ 13 With respect to the first factor, he said that it was not the most serious and, although his testimony is that because of the difference in the roof elevation between the addition and the existing building this would increase the snow load on the existing building and the engineers should have provided for that by reinforcing the part of the roof of the existing building that had not been reinforced.

¶ 14 With respect to the third factor, this witness said that the building was deteriorating because of flawed construction and the stripping for the roof was bad. It is also his opinion that the Defendant Poole failed to be concerned with respect to the weight on the existing roof and that this Defendant should have dealt with this problem. The roof on the original building was visible for inspection in 1987 and 1990, and it should have been reinforced. He concluded by saying that the primary responsibility rests with the existing roof not being strong enough to carry the snow load.

¶ 15 Salinas is a structural engineer specializing in wood engineering and has been a professor in engineering at Carleton University for the past 26 years. He was asked by a colleague engineer and professor by the name of Adjeleian as a favour to the late mayor of the Town to assess the structural integrity and safety of the existing building. He inspected the building before part of the roof was reinforced and he made the recommendations and proposed remedial work as stated earlier in this judgment.

¶ 16 It would seem that the Town took it upon themselves to do remedial work without further consultation with Salinas. In fact, Salinas did not even know that the work was carried out because he says he never went back to the site after his report was completed although Lalonde says he saw him there two or three times when the existing roof was reinforced.

¶ 17 Salinas tells us that his report was not intended for construction purposes and to use his report for that purpose would have required drawings sealed and signed by him or another professional engineer. He was never told that his report would be used to effect the reinforcement of the roof on part of the existing building. He made no report on the condition of the roof on the southwest side of the building because that part of the building was locked when he inspected the building and he could not gain access to it. In fact, the Town was not interested in reinforcing that part of the roof of the existing building because the space beneath it was to remain vacant for the time being.

¶ 18 John Leggett, another structural engineer was called by the Town. He was retained by insurance adjusters to prepare an engineering report on the localized roof failure which occurred on March 14, 1993. In his report, he states:

> Drawings as submitted for building permit for the 1987 and 1990 building additions were viewed in the Town office. Both sets of drawings indicated the design loading for the roofs of the new buildings but made no reference to the increased snow loading (as per the Ontario Building Code) acting on the adjacent, existing, lower roof structure of the original building. Both sets of drawings were stamped by registered professional engineers.

He concludes:

> ... The fact that the roof failure occurred shortly after the heavy snowfall of March 12, 1993, in the area adjacent to the ridge (the highest point) of the 1990 building addition, would suggest that the probable cause of the roof failure was overstress of the trusses as a result of drifting snow ...

¶ 19 He found that the building was not particularly well maintained and had several deficiencies. He said that the additions to the building, which were higher than the existing building by some 14 feet, could induce snow drifting on the existing building and that at one point the snow load would be 104 pounds per square foot where the roof collapsed.

¶ 20 It is his opinion that the calculation of the snow load on the existing building would be the responsibility of the Defendant Poole and that the structural engineer should have assessed the snow load on the existing building due to the construction of the additions.

¶ 21 Robert Halsall is a professional engineer who graduated as a civil engineer in Glasgow, Scotland in 1947. Amongst his many other professional affiliations, he is a fellow of the institute of professional engineers. He was asked the following questions and gave the following answers:

> Question A:
> Is it the responsibility of a building department to determine or be alerted to the effect of a new addition to an existing building in terms of snow load and specifically when the Town approved the drawings for 1987 and 1990 additions, did they have a responsibility to check as to the implications of increased snow load acting on the adjacent and existing roof structure of the original building?
> Response A:
>
> A.2 In my opinion, one of the primary functions of a municipal building department is to ensure that buildings within the municipality comply with the Codes and Building Standards which have been adopted by that municipality, for purpose of avoiding risk to public safety. Some building departments have on staff structural engineers who are competent to assess the information provided on drawings submitted for building permits. Such departments from time to time undertake detailed design checks, which would include assessing the loadings on new buildings and also their effect on existing adjacent buildings.
> A.3 Many building departments do not have structural engineers on staff. In those cases I believe the municipality should be entitled to rely on the technical expertise of the professional engineers and/or architects who have sealed drawings submitted for building permits.
> A.4 However, I believe the municipality does have an obligation to ensure that documents submitted with building permit applications do contain the information

required by the appropriate by-laws. This is more an administrative issue than a matter of design expertise.

A.5 It is common practice for building departments to review drawings to ensure among other items that structural safety issues such as roof and floor loadings are properly indicated on drawings.

A.6 Smith Falls By-Law 3844-71 which would have applied when the original building was constructed in 1973, adopted the 1970 National Building Code (NBC), but added Sub-Section 1.8.1 which gave the building department the authority "when deemed advisable, to require the certificate of a qualified architect or Registered Professional Engineer, qualified in building construction certifying that plans and specifications submitted by an applicant comply with the provisions of this by-law".

A.7 Although I have not seen permit drawings for the original construction, reference in the available material indicates that structural drawings were stamped by N. Masika, P.Eng. Thus the procedure may well have complied with the then applicable by-law and the municipality could rely on certification by Mr. Masika.

A.8 The 1970 NBC did require that "Review of the construction of any building or part thereof shall be carried out by the designer or by another suitably qualified person to determine whether or not the construction conforms to the design". Such a review, if carried out, could have given the Municipality additional assurance about the adequacy of the structure.

A.9 The report on the original building by Adjeleian and Associates (Adjeleian) in 1981 clearly indicates that the original structural construction was deficient, but, as noted in A7, it seems probable that the municipality could have properly relied on the professional competence of Mr. Masika.

A.10 When application was made for a permit for the first addition in 1987, the applicable building code appears to have been the Ontario Building Code (OBC) 1983. I have not seen any supplementary by-laws that may have been added to the municipality concerning the processing of applications.

Smith Falls By-Law 4234-76 may have still been in effect. It states in Sub-Section 2.3.1 "Sufficient information shall be submitted with each application for a permit to enable the chief official to determine whether or not the proposed work will conform with the Act, the Regulations thereunder and any other applicable law".

A.11 The three drawings relating to the 1987 addition which have been provided to me do not provide clear details of the relationship between the new work and the building that then existed. Drawing M2686 gives the eaves height of the proposed addition as 14'-0", and the slope of the roof as 1/4 in 12, to a peak on the centreline of the new building. On a slope length of 90ft this would result in a peak height of 14'-0" plus 90x1/4"=15'-101/2". The height of the existing roof is not given, but "Front Elevation" on drawing M2686 does show that the roof the existing building is lower than the eaves of the proposed addition.

The Adjeleian report of 1981 gave the roof height of the existing building as 12'-0".
There was thus sufficient difference in height between the two roofs to result in snow drifting and a requirement for an increased design load as set out in the then current OBC.
In my opinion it was the responsibility of the building department under those circumstances to recognize that there was a difference in roof levels that would affect the snow loading on the existing roof. The building department should have ensured that the drawings submitted for building permit application contained sufficient information to allow determination of the effect of increases snow loading on the existing roof. I would not expect the building department to be responsible for checking the effect on the existing roof, but they had a responsibility to ensure that enough information was provided, and that the issue had been addressed by a professional engineer.

A.12 In this particular case, as there had been a partial collapse of the existing roof as investigated and reported by

Adjeleian in 1981, before application was made for the 1987 addition, I would expect the building department to be aware of the sensitivity of the existing building and to be particularly aware of and concerned about the implications of building a higher building adjacent to the existing one.

Question B:
Did the Town act reasonably in carrying out repairs to part of the roof of the existing building as opposed to reinforcing the entire roof?
Response B:

B.1 In my opinion it was not reasonable to leave a portion of this roof unreinforced after being notified of the deficiencies described in the Adjeleian 1981 report. It had to be assumed that the balance of the building probably failed to meet the design requirements of the Ontario Building Code, both at the time of original construction, and in 1981 and 1987.

¶ 22 He stated that the 1987 addition had nothing to do with the roof collapse.

¶ 23 It is his opinion that the building officer is entitled to rely upon the seal of the engineer and the Town does not have to redo the calculation for snow drift. The building officer saw the stamp of the engineer on the 1987 and 1990 drawings and made assumptions and in his opinion he could rely on the drawings.

¶ 24 After hearing all the evidence, I have come to the conclusion that the negligence of both defendants was responsible for this roof to collapse.

¶ 25 These damages could have been avoided if the Defendant Poole had calculated the possible snow load on the original building because of the construction of the two additions constructed to a height of 14 feet higher than the existing building.

¶ 26 These damages could have been avoided if the Town had warned the Plaintiff who purchased the building that only part of the roof was reinforced, and if the Town had required, as does the OBC that a calculation be made showing the snow load on the existing building due to the construction of the additions when they knew or should have known that the additions were taller than the existing building.

¶ 27 I cannot find whose negligence is greater in the circumstance and I, therefore, conclude that the defendants are equally at fault and each will pay one half of the agreed sum of $2,175,000.00. For obvious reasons, the cross-claim of each defendant is dismissed. If necessary, I am to be spoken to with respect to costs.

MANTON J.

La Sucrerie Casselman Inc. v. Cambridge (Township)

Between
La Sucrerie Casselman Inc., plaintiff, and
The Corporation of the Township of Cambridge, Jacques Whitford Limited and John D. Paterson and Associates Ltd., defendants

[2000] O.J. No. 4650
Court File No. 97-CV-002942-CM

Ontario Superior Court of Justice
Morin J.

December 5, 2000.

Counsel:

Paull N. Leamen, for the plaintiff.
Ben Marcus, for the Corporation of the Township of Cambridge.
P. Donald Rasmussen, for Jacques Whitford Limited and John D. Paterson and Associates Ltd.

¶ 1 **MORIN J.**:— In 1990 the plaintiff constructed a combination theatre and restaurant on its land at a location which put the building at risk of being consumed by a retrogressive landslide into the South Nation River. The chance of such a landslide occurring is slight but the result could be so catastrophic that the risk is unacceptable, absent appropriate remedial work being carried out.

¶ 2 The plaintiff now seeks damages from the defendant geotechnical engineers who provided it with some support in an application for a building permit and from the defendant municipality that issued the building permit.

¶ 3 Attached to these Reasons as Schedule "A" is a summary of the evidence which I have prepared from my bench notes. I have reviewed and considered all of this evidence in arriving at my conclusions.

¶ 4 The plaintiff's property is bounded on the north by the South Nation River. The property is located on the seventeen kilometer stretch of the South Nation River between Casselman, five kilometers to the east of the plaintiff's property and Lemieux, twelve kilometers downstream from the plaintiff's property.

¶ 5 Over the centuries several retrogressive landslides have occurred along that stretch of the South Nation River. In 1971 a retrogressive landslide occurred toward the Lemieux end of the stretch of river which saw approximately seventy-five acres of land slide into the river. In the Summer of 1993 the biggest retrogressive landslide of recorded history occurred at the Lemieux end of the river stretch. That landslide retrogressed for a distance of several hundred meters and the extent of its devastation can be seen in the photographs tendered as Exhibit 19 in this action. In the immediate area of the plaintiff's lands there are scars left by three significant retrogressive landslides which appear to have occurred sometime during the nineteenth century. Two of these landslides occurred almost directly across the river from the plaintiff's lands. The third occurred on the same side of the river as the plaintiff's land, a few hundred meters to the east of the plaintiff's land.

¶ 6 Following the 1971 landslide the Provincial Government, through its Ministry of Natural Resources (MNR), became actively concerned about this stretch of the river and the potential for devastating retrogressive landslides. Since that time there have been many studies conducted and significant government involvement both at the provincial and municipal level. As well, beginning in the early 1980's the South Nation River Conservation Authority (the Authority) whose responsibility it is to manage natural resources within the watershed, became involved in identifying and protecting areas susceptible to retrogressive landslides.

¶ 7 Beginning in 1985 Golder Associates, consulting geotechnical and mining engineers, in the person of Clifford Morey (Morey), began to perform slope analysis on the river particularly at an area known as the Sequinburg Development downstream of Casselman.

¶ 8 Morey is a registered professional engineer, a member of the Canadian Geotechnical Society and a designated consulting engineer. He received his B.SC. Geological Engineering from Queens University in 1973 and his M.Sc. (Eng), Civil Engineering, from the same university in 1977. He took further graduate courses in Civil and Geotechnical Engineering at the Universities of Windsor and Carleton in 1980 and 1982. He was employed as a geotechnical engineer by Golder Associates from 1980 to

1994 during which time he performed subsurface investigative work and slope stability analysis in the area of the South Nation River. He has performed a half dozen geotechnical investigations on the South Nation River along its length from Casselman to Lemieux and beyond those limits has conducted approximately another dozen geotechnical investigations on the river. Morey left Golder Associates in 1994 and since that time to the present has been president of his own engineering firm carrying out geotechnical and hydro geological investigations and environment site assessments. He continues to this date to do work in connection with the South Nation River. On the evidence there is no one in the profession who has done as much work as he in connection with the South Nation River.

¶ 9 At Tab 13 of Exhibit 4 is a letter from Golder Associates in the person of Morey to the Authority dated July 15, 1988 confirming Golder Associates' interest in continuing to provide geotechnical services to the Authority relating to slope stability along the South Nation River and outlining a proposed methodology for investigating the stability of the slopes along the river between Casselman and Lemieux. Golder Associates was in fact retained by the Authority for that purpose and Morey was project engineer. The retainer was prompted primarily by MNR. That particular stretch of the river was of particular interest because of the retrogressive landslide of 1971 and the growing wish to develop along the river in the face of safety concerns.

¶ 10 The letter of July 15, 1988 outlined a three phase plan, phase 1 of which was already in progress at the time that the letter was sent and which included the drilling, at some fifteen individual sites, some twenty-two bore holes, analysis of the bore hole results and a determination, following the drilling and site recognizance work, of the stability of the slopes at each site by way of computer methods and the evaluation of retrogressive landslide activity for each site. Phase 2 was intended to consist of detailed contour mapping of the site to provide cross sections of the riverbank at any specific location throughout the site to permit decisions to be made in view of present and possible future land use as to areas of the site where it would be appropriate and beneficial to carry out further specific detailed investigations to determine the remedial works required to stabilize the riverbank. Phase 3 would consist of specific site investigations in high risk areas.

¶ 11 At Tab 15 of Exhibit 4 is the Golder Associates report dated September 1988 submitted by Morey to the Authority and relating to Phase 1 of the work. The report notes that a review of air photos of the South Nation River between Casselman and Lemieux indicates that at least fifteen retrogressive type slope failures have occurred historically along this twenty kilometer section of the riverbanks. The river is approximately one hundred meters wide.

¶ 12 Marked as Exhibit 5 was FIGURE 2 from the report which shows fifteen or sixteen retrogressive landslide areas. As Morey testified, the number of such retrogressive slide areas is significant in that it shows the activity along the river shores and the tendency for retroactive landslides along that stretch of the river. The landslide designated as M occurred in 1895 and retrogressed some six hundred and fifty meters from the river's edge. The landslide designated as H occurred in 1910 and retrogressed some three hundred and fifty meters from the river's edge. Exhibit 5 shows that apart from the three significant landslides in the immediate area of the plaintiff's property, the bulk of the landslides occurred at the Lemieux end or the downstream end of the stretch.

¶ 13 The landslide sites shown on Exhibit 5 were plotted on Table II appended to the report. The width and distance of retrogression from the river's edge of each of the landslides is indicated in Table II. The distance of retrogression from river edge varied from fifty meters to six hundred and fifty meters. As Morey put it, these slides are an indication of what happened in the past and what might happen in the future.

¶ 14 I may say that of all the geotechnical engineers that I heard from during the course of this trial, none has as much practical experience as Morey with respect to the stretch of the river under consideration and none is as qualified to address the question of initial slope failure at any given site and the retrogressive distance in the event of an initial failure. Where his evidence is at odds with any of the other technical evidence that I have heard during the course of this trial, I much prefer his.

¶ 15 For the purpose of this report, MNR selected fifteen sites for bore holes and Morey put down twenty-two bore holes at the fifteen sites with some bore holes being placed both at the crest and at the toe of the slope at a given site. Following completion of drilling, piezometers were placed at different levels in the hole to measure ground water in the slope and to provide a profile of ground water in the slope. In addition, profiles in the slopes in terms of steepness and height were developed. The bore holes generally disclosed an upper sand layer over silty clay that became stiffer the deeper it went. Test results indicated generally that the toes of the slopes were very unstable and that some of the steeper slopes had safety factors of less than 1.5. The safety factor is the ratio of forces that resist failure over forces that tend to cause failure and is determined by a

computer analysis. A safety factor of 1.5 is considered safe in the industry. Anything below 1.5 is considered questionable and as the ratio approaches 1 the risk of failure increases. If the safety factor is below 1 then the slope has, in fact, failed. Theoretically, a slope with a factor of safety of less than 1 will fail and a slope with a factor of safety greater than 1 will not fail. However, for the purpose of this study, a computed factor of safety of 1.0 to 1.3 was considered to indicate an unstable slope condition while a factor of safety of 1.3 to 1.5 was considered to indicate a slope which is less likely to fail in the long term and provides a degree of confidence against failure ranging from marginal to adequate should actual conditions vary from the assumed conditions. A factor of safety of 1.5 or greater is considered to indicate long term stability provided the slope profile is not steepened by toe erosion or by other means.

¶ 16 The report makes reference to the ground water conditions as ascertained by the piezometers in each of the bore holes. The results indicated that the riverbank is generally saturated below a depth of 1 to 2 meters where the sand cap is relatively thin and where the sand cap is significantly thicker, the slopes are saturated below a depth of about 4 to 5 meters. It was noted that at all sites the ground water measurements indicate that a downward flow of the ground water is occurring within the slopes.

¶ 17 The report beginning at page 11 thereof, discusses the theory of landslide retrogression. It would be worthwhile to quote from that portion of the report:

> It is considered that retrogressive landslides and earth flows are initiated by a simple rotational failure of a slope in a "drained" strength condition (no negative pore water pressures). This initial slope failure may encompass the entire slope or only a portion of the overall slope face. Retrogression occurs when the slide debris from this initial simple rotational slip flows out of the failure area and leaves an unstable backscarp which in turn fails. Continued reoccurrence of this phenomena results in retrogression of the landslide as long as the slide debris flows out of the failure area and the slope material continues to fail in a drained state. However as the slide continues to regress, negative pore water pressures develop due to lateral stress relief causing an undrained strength condition to exist in the backscarp materials. This has the effect of increasing the strength of the soil comprising the slope and will terminate the landslide retrogression unless the conditions of the backscarp allows the criteria for undrained failure to be satisfied.
> The criteria for undrained failure of a slope backscarp can be related to the slope stability number. The stability number, Ns, of a slope is defined as the ratio of the height of the slope and the unit weight of the slope material to the undrained sheer strength of the slope material. If the stability number of a backscarp is calculated to be greater than 4, it is considered that the backscarp has satisfied the condition for undrained failure and is likely to fail and allow retrogression of the landslide to continue in an undrained condition. Retrogressive flow slides will terminate when retrogression produces a condition such that the undrained failure criteria is not satisfied. This could occur if the undrained sheer strength of the backscarp material increases as the slide progresses into the table land, the height of the backscarp decreases as the failure area becomes shallower, or the slide debris fails to flow from the failure area. The more devastating landslides, however, develop into earth flows due to what is considered to be the phenomena of plastic extrusion of softer cohesive materials which exist at depth in the slope due to the weight of the overlying materials. It is considered that for steep backscarps in sensitive clays a continuous plastic flow phenomena can develop if the stability number is greater than 6.

¶ 18 Exhibit 5A is a portion of the report analyzing various slope profiles. It was Morey's evidence that the slope profile drawn at FIGURE 6 of Exhibit 5A is the closest slope profile to the plaintiff's lands. FIGURE 6 describes it as Slope Profile - Site 1/2. If one refers to Exhibit 5 one will see that bore holes 1 and 2 are in the vicinity of the plaintiff's lands with number 1 bore hole being near the top of the slope and number 2 bore hole near the toe of the slope. Morey's analysis of Site 1/2 was that it was a sensitive clay site with a minimum safety factor of 1.0 in the toe and an overall safety factor of 1.4.

¶ 19 Generally, the results of the computer stability analysis indicated that all sites investigated, except for designated sites which did not include Site 1/2, had the potential for either slope toe or overall simple rotational instability either of which could initiate a retrogressive landslide. (See INTERPRETATION OF RESULTS, page 18 of the report)

¶ 20 Conrad Lamadeleine (Lamadeleine) is the sole shareholder of the plaintiff company. He has lived most all his life in Casselman. He has carried on business there as an investment and insurance broker since 1961

and indeed he was the reeve of Casselman for some thirteen years until approximately two years ago.

¶ 21 The subject property was first acquired as a twenty-eight acre lot in 1982 for the sum of $45,000.00. Lamadeleine eventually transferred approximately twenty acres of the property to the plaintiff company and kept about eight acres for himself. The property contains a sugar maple bush and upon purchase Lamadeleine started up the maple syrup business which had been carried on there years before.

¶ 22 For all intents and purposes, except for a short period of time in 1996, the plaintiff's lands were included in set back zones established by the MNR and the defendant municipality. These zones were variously referred to as hazard zones or study zones in which potential retrogressive land slides were of concern. Mr. Lamadeleine at all material times was fully aware of that fact and was very much aware of the concerns that the authorities and others in the municipality had with respect to the stability of lands bordering the South Nation River between Casselman and Lemieux.

¶ 23 In late 1987 or early 1988 Lamadeleine was considering expanding the company's business to include a bilingual summer theatre. The existing building on the property was not adequate for a theatre and Lamadeleine was considering constructing a new building which would be a combination theatre and restaurant, perhaps sixty feet wide by eighty feet long, designed to accommodate approximately three hundred people. Initially his plans were to construct this new building to the south of a large deep ravine that ran across the more southerly portion of the lands in an east west direction.

¶ 24 In a letter from MNR to Lamadeleine dated November 10, 1987, the Ministry responded to concerns that Lamadeleine had expressed about the hazard area. The letter reads in part as follows:

> The concerns you describe are unfortunate. These concerns are shared by other property owners along the South Nation River. Our Ministry's role is to determine how serious the landslide problem is and to recommend appropriate building set backs or other solutions for consideration by the Township. As this Ministry has no direct control on permitted land use, we respectfully request that you direct your concerns to the Township.

See Exhibit 4, Tab 8.

At Tab 9 of Exhibit 4 is a letter from the Ministry to Lamadeleine dated December 14, 1987 which reads in part as follows:

> Enclosed is a map outlining the known earth flow failures near your property. These failures have been identified as occurring in the 1800's. In the earth flow zone, between Lemieux and Casselman, 18 large failures have been identified and 3 have occurred in the last 95 years.

¶ 25 At Tab 14 of Exhibit 4 is a letter from the Ministry to Lamadeleine dated August 31, 1988. It reads in part as follows:

> Subsequent to our visit to your summer theatre/sugar bush we requested clarification of where the line identifying the set back traversed your property. You will note on the attached map that it includes most of your bush and the site of the proposed new theatre.
> The slopes in the "earth flow" area in which you are located are presently being evaluated. Our regional engineer is expecting results this fall of tests based on bore holes already completed. The South Nation River Conservation Authority has requested funding to continue this study into 1989.
> A reduction or modification to the earth flow area can only be determined after the completion of this study. Based on the best available information on slopes in your area, we cannot recommend a reduction at this time.

¶ 26 While the site that Lamadeleine had chosen for the construction of the new theatre restaurant was located to the south of the east west ravine, there was an existing building located to the north of the ravine which, with appropriate modification and extension, could accommodate upwards of two hundred people. It was suggested to Lamadeleine by an associate that he renovate the existing building and operate the theatre restaurant in the renovated building for a few years in order to determine whether the business was viable. He decided to do so. The existing building was located to the north of the east west ravine at a distance of approximately one hundred and eighty meters from the river's edge measured perpendicular to the river. That is, the shortest distance from the building to the river's edge was approximately one hundred and eighty meters.

¶ 27 Before issuing a building permit for the renovations, the defendant Municipality required a site specific geotechnical inspection and analysis to

Caselaw

determine whether the renovated building would be a safe distance from the river having regard to the concerns relating to retrogressive landslides.

¶ 28 After delivery of the September 1988 report to the Authority by Golder Associates, Lamadeleine attended at Morey's office and asked him to carry out an investigation of his site. Initially Morey suggested that Lamadeleine go to other consulting engineers because he was concerned that there might be a conflict of interest having regard to the fact that Golder Associates were retained by the Authority. Lamadeleine persisted. Morey conferred with the Authority and his own people and it was decided that Golder Associates in the person of Morey could be retained by Lamadeleine directly to investigate his site.

¶ 29 Morey had been told by Lamadeleine that he wanted to build a new theatre building on his property which was in a hazard zone and as a result he needed a site specific study to hopefully show that he was not in danger of a retrogressive landslide. The hazard zone established by MNR of some 800 meters from the riverbank and which had been established for approximately 10 years at the time encompassed the plaintiff's lands.

¶ 30 After being retained, Morey placed a bore hole on the Lamadeleine site, performed lab work, did an analysis of the slope, and eventually came up with a report.

¶ 31 By letter dated October 20, 1988 Morey provided Lamadeleine with a preliminary report. See Tab 20, Exhibit 4.

The preliminary report stipulates the following:

(a) The purpose of the evaluation was to determine the potential for retrogressive flow slide or earth flow to occur at the subject site and to determine a safe set back distance from the South Nation River for the construction of a proposed theatre building;
(b) Remedial measures to reduce or eliminate a required construction set back distance were also to be presented if considered necessary;
(c) Based on the results of the in situ and laboratory testing and imperical relationship which can be used to relate to soil parameters with the potential for flow slide or earth flow phenomena, it was considered that the general site area is susceptible to retrogressive flow sliding but probably not susceptible to the more devasting earth flow form of landslide.
(d) Based on the analysis a safe set back distance from the river edge for the building construction was calculated to be 400 meters;
(e) The set back distance of 400 meters might be substantially reduced by ensuring that initial failure of the river bank did not occur. Although detailed stability analysis had not at that time been carried out to determine exactly the appropriate remedial measures required to stabilize the riverbank, based on previous slope stability analysis carried out within the general area of the site, it was considered that flattening of the slope toe area at the river edge to an inclination of three horizontal to one vertical, and providing erosion protection using rip rap and geotextile in the lower portion and mulch and seeding for the upper portion would be sufficient. The length of riverbank along which the remedial work would need be carried out depended on the actual location of the proposed building and the distance between the proposed building and the riverbank. Once the desired location for the proposed building had been chosen the extent of riverbank remedial works could be determined.
(f) There are two major ravines located in the south east quarter of the lands. Major ravines act as a barrier against flow slide or earth flow retrogression. Accordingly, a portion of the lands is naturally protected from retrogressive landslides. The area of the site which is considered safe from landslide retrogression due to the presence of the ravines comprises an area bounded on the north by the east west running ravine located immediately south of the existing building.
(g) If the desired location of the proposed building is somewhat outside of the area described as being naturally protected by the ravine, the ravine could be extended and/or deepened to provide suitable protection.

¶ 32 In due course, Morey produced to Lamadeleine his final report which is dated November 1988 and is located at Tab 23 of Exhibit 4.

¶ 33 The final report confirms in greater detail the information and opinions contained in Morey's initial report. The final report details the procedures used, the existing conditions at the site, the theory of landslide retrogression and sets out the formula used by Morey in determining

retrogressive distance. Beginning at page 7 of the report, the following is said:

> The distance a landslide may retrogress has been studied by others to formulate imperical relationships between slope retrogression distance and easily determined slope parameters. Co-relations have been imperically developed based on documented landslides in eastern Canada which relate distances of retrogression with the stability number, the stability number and liquidity index or sensitivity and with the liquid limit and plasticity index of the slope materials. Based on co-relations relating these parameters to retrogressive distance and the results of the previous investigation carried out to assess the retrogressive landslide potential of the South Nation riverbank slope from Casselman to Lemieux, it is considered that the following equation provides an acceptable method for estimating retrogressive landslide distances in this reach of the South Nation River. R=(Ns-4) 180 where R = estimated retrogression distance in meters for Ns greater than 4.5. Ns = maximum stability number calculated for a specific slope.

¶ 34 Evidence during the trial would indicate that this is the most conservative formula for determining retrogressive distance. Having regard to the use to which the building was intended to be put and the number of people that might occupy it at any given time, it was reasonable for Morey to take the more conservative approach. In any event, the evidence disclosed that using this formula with respect to sites where retrogressive landslides had already occurred, resulted in the calculation of a retrogressive distance very similar to the actual extent of retrogression.

¶ 35 Under the heading RESULT, the final report at page 9 thereof states the following:

> The results of the site recognizance indicate that the riverbank toe slope at this site is in an active state of erosion and evidence of previous slope toe area failures and surficial sloughing is extensive.

and further at page 9:

> The stability numbers for the slope at this site have been calculated based on the results of the in situ vane sheer testing carried out in the bore hole. The calculated stability numbers range from about 1.0 to 5.9. All calculated stability numbers based on the in situ vane sheer strength obtained below a depth of 7 meters are greater than 4. Accordingly a steep failure backscarp at this site would be considered unstable in an undrained state thus satisfying the criteria for retrogressive undrained failure.

¶ 36 At page 10 of the report the following is said:

> The above results indicate that an initial slope toe area failure is possible at this site. A backscarp left from an initial slope failure is likely to continue to retrogress and the material remolded from the initial and subsequent slips is likely to flow out of the failure area resulting in a retrogressive flow side. Based on the retrogression distance equation previously discussed, a retrogressive flow slide at this site could be expected to regress some 340 meters behind the river shoreline.

¶ 37 Under the heading REMEDIAL WORKS in his final report, Morey points out that the results of his investigation indicate that a retrogressive landslide encompassing table land to some 340 meters back of the river's shoreline, is possible at the subject site and that a safe set back distance from the river's shoreline for building construction at the site is considered to be 400 meters. The final report goes on to point out that the set back distance may be substantially reduced by ensuring that initial failure of the riverbank does not occur. Morey points out that detailed stability analyses have not been carried out to determine exactly the appropriate remedial measures required to stabilize the riverbank but notes at page 11:

> ... however based on previous slope stability analyses carried out within the general area of the site, it is considered that flattening of the slope toe area at the river edge to an inclination of 3 horizontal to 1 vertical, together with some upper slope flattening and providing erosion protection using armour stone rip rap and geo-textile in the lower portion and mulch and seeding for the upper portion should be sufficient. The length of riverbank along which the remedial work would be carried out depends on the actual location of the proposed building and the distance between the proposed building and the riverbank. Once the desired location for the proposed building has been chosen, the extent and details of the riverbank remedial work can be determined.

Later in the report in discussing any required extension to the east west ravine, Morey points out that to prevent erosion of the extended ravine channel, a layer of protective rip rap should be provided within the channel and says the following:

> The rip rap should consist of a 450 millimeter thickness of 300 millimeter nominal size blast rock underlain by a suitable geo-textile filter fabric such as Mirafi P140.

¶ 38 The final report goes on to say the following at page 11:

> A recognizance of the site indicates the presence of 2 major ravines in the south east quarter of this site. It is known, based on observations of previous flow slides and earth flows, that major ravines act as a barrier or limit beyond which flow slide or earth flow retrogression does not extend. Accordingly it is considered that a portion of this site is naturally protected from retrogressive landslides. The area of the site which is considered safe from landslide retrogression due to the presence of the ravines encompasses an area bounded on the north by the east west running ravine located immediately south of the existing dance hall building and on the west by a line drawn southward from the south east corner of the dance hall building to the north west corner of the existing house at this site. This area is indicated in the attached site air photo, Figure 4. In planning the location of a building in this area a set back distance of between 10 and 20 meters from the crest of the ravine slope should be established. The actual set back distance within the above range depends on the height and inclination of the ravine slope adjacent to the proposed building location and should be determined in the field by the geotechnical engineer once the site for a proposed building has been chosen. In addition the chosen site of any proposed building which will rely on the presence of the ravines as the safeguard against landslide retrogression must be approved in the field by the geotechnical engineer.

¶ 39 It should be noted that the east west ravine was itself within the retrogressive distance computed by Morey.

¶ 40 Morey's two reports to Lamadeleine clearly indicate that if he wished to construct the building to the north of the east west ravine, it would be necessary for him to do extensive remedial work to the riverbank. Details as to the actual work to be done and the length of riverbank along which the remedial work would be carried out would have to be determined by further geotechnical analysis once the actual proposed location of the building was determined. The reports clearly told Lamadeleine that the building could be constructed to the south of the east west ravine which ravine would safeguard against a retrogressive landslide. Construction to the south of the ravine would obviate the necessity of doing remedial work at the riverbank.

¶ 41 Clearly, Morey in his reports told Lamadeleine to either do the remedial work at the riverbank or construct the building to the south of the east west ravine, extended if necessary. It was Morey's evidence that Lamadeleine had a perfect understanding of the advice being given to him and the alternatives being presented to him to safeguard against a retrogressive landslide and I find that to be the fact. As it turned out, Lamadeleine did not do the remedial work and constructed the building on the north side of the ravine.

¶ 42 Eventually Lamadeleine requested Morey to visit the site on two further occasions, October 19, 1988 and November 23, 1988. The purpose of the October 19th visit was to discuss the location at the site where construction of the proposed theatre building would require no remedial work. The site visit on November 23rd was to inspect and approve completed remedial work to the east west ravine performed in order to accommodate the location of the proposed building to the south of the ravine with a portion of it slightly to the west of the natural west end of the ravine. In other words, the east west ravine was extended a distance to the west in order to accommodate the construction of the building on the south side of the ravine further to the west.

¶ 43 In a letter to Lamadeleine dated December 28, 1988 located at Tab 25 of Exhibit 4, after referencing the two site visits Morey says the following:

> With regard to the remedial works carried out at this site, the results of the inspection on November 23, 1988 indicated that the existing ravine had been sufficiently extended and deepened to provide adequate protection against the possibility of a landslide for a building located on the south side of the ravine and east of the west extent of the ravine.

¶ 44 On the occasion of the site visit on November 23, 1988, Lamadeleine indicated to Morey that the building would be located south of the gully.

¶ 45 At Tab 34 is a letter from Morey to Lamadeleine dated April 21, 1989. The letter purports to provide clarification of the inspection of the work carried out at the site to protect the proposed theatre restaurant building from possible landslide retrogression. Morey in his evidence was unable to offer any explanation as to why Lamadeleine required clarification of the letter of December 28, 1988. In any event, the letter of April 21, 1989 notes that:

> The remedial work alternative chosen and carried out consisted of deepening the existing east/west running ravine at the site and extending the ravine westward beyond the proposed building location.

¶ 46 In the face of all of the documentation from Morey to Lamadeleine, which I find as a fact was at all material times in the hands of the Municipality, Lamadeleine applied for and obtained a building permit dated May 12, 1989 from the Municipality permitting him to construct an extension to the existing building north of the east west ravine thus turning the building into a combination theatre and restaurant which would accommodate some 200 persons. It remains to this day a mystery how the Municipality could have issued such a permit in the face of the Morey reports and letters without first satisfying itself that the required remedial work to the riverbank as determined by Morey had been satisfactorily completed. It should be noted that no knowledgeable person was called to give evidence during the course of this trial to explain the defendant Municipality's involvement in the issuance of the building permits. The only witness called on behalf of the Municipality was Steven Gauthier, an employee of the Nation Municipality into which the defendant Municipality of Cambridge has amalgamated. Gauthier began his employment with Nation Municipality in 1998 and had no involvement in this case before that. He was able to confirm that Brunette, the Municipality's Clerk at all material times, would know all about these matters as would Brisson, the building inspector at the material times. He confirmed that these individuals are still in the locality and available to come to trial to testify. He confirmed as well that there are members of the sitting council at the material times that are still in the area and available to testify.

¶ 47 In his evidence Lamadeleine testified that he did not understand the two alternatives being presented to him by Morey. Indeed those two alternatives are again set out by Morey in a letter to Lamadeleine dated May 2, 1989 at Tab 38 of Exhibit 4 which letter I find was in the hands of the Municipality at all material times. I totally reject Lamadeleine's evidence. I find as a fact that when he applied for and obtained a building permit to extend the existing building located to the north of the east west ravine. He knew full well that what little work he had done on the riverbank was not the remedial work referred to by Morey in his reports and had never been inspected or approved by Morey. Indeed, Lamadeleine knew full well from the reports that the extent of the riverbank remedial work, assuming he wished to construct to the north of the ravine, could only be determined by Morey once the actual building location to the north of the ravine had been determined. Prior to construction of the extension to the existing building located to the north of the ravine, Lamadeleine consistently advised Morey of his intention to construct to the south of the ravine. In my view, Lamadeleine purposely withheld from Morey the fact that he intended to extend the building located to the north of the ravine understanding full well the contents of Morey's reports to him and knowing full well that Morey would not have approved.

¶ 48 It is clear on the evidence that prior to the construction of the extension to the existing building north of the ravine, no meaningful remedial work had been performed by Lamadeleine at the river's edge.

¶ 49 Morey testified as to a meeting on the subject lands with a number of people including the Mayor of Cambridge, a representative of MNR, a representative of the Authority, members of council, the plaintiff and Lamadeleine. He does not recall whether the meeting was before or after the burning down of the first theatre restaurant. The purpose of that meeting was to determine whether the remedial work carried out by Lamadeleine on the riverbank was satisfactory. I accept Morey's evidence and find as a fact that it was at the time of that meeting obvious to everybody that what Lamadeleine had done on the slope was not remedial work and was totally inadequate. It did nothing to stabilize the riverbank. The work was not in any way in conformity with Morey's recommendations as contained in his two reports. It is likely that that meeting took place sometime after the extended building was destroyed by fire.

¶ 50 Shortly after issuance of the building permit dated May 12, 1989, the renovation work to the existing building north of the ravine began. The Township building inspector inspected the work to completion.

¶ 51 The renovation to the existing building on the north side of the ravine was completed in the Spring of 1989 and business was carried on

there in 1989 and 1990. In August of 1990 a fire occurred in an adjacent trailer being used by a theatre group. The fire spread to the building which burned to the ground.

¶ 52 It would appear that after the fire occurred Lamadeleine initially intended to rebuild on the south side of the ravine. He already had architectural designs for the site on the south side of the ravine. Indeed the application for a building permit received by the defendant Municipality on September 26, 1990 is stipulated as being for the construction of a theatre restaurant on the south side of the ravine. Although we have no first hand evidence on the point, we do have Lamadeleine's evidence that the health unit in Cornwall would not allow the existing holding tanks located on the north side of the gully to be moved to the south side of the gully. According to Lamadeleine's evidence the health unit was requiring that a new well and new septic system be established on the south side of the ravine if the new building was to be located there.

¶ 53 In any event, sometime subsequent to the destruction by fire of the renovated building located on the north side of the ravine, Lamadeleine became bound and determined to construct his new combination theatre restaurant on the same site, that is, to the north of the ravine without doing any of the remedial work at the river's edge as required by Morey. It is likely that in making this decision Lamadeleine was motivated by financial considerations.

¶ 54 By this point in time Lamadeleine was quite aware that the Authority objected to his building on the north side of the ravine without the remedial shore work being done. Lamadeleine confirmed Morey's evidence that after the fire on August 4, 1990, there was a meeting on the site with the Municipality, the Authority and Morey and it was made clear to Lamadeleine at that time that in Morey's opinion, the little work that Lamadeleine had done on the river's slope was not in any way sufficient nor did it constitute the remedial work set out in Morey's reports for a building to be located to the north of the ravine. It appears that at that point in time Lamadeleine was advised by the defendant Municipality that if he proposed to construct the new building to the north of the ravine, then he would have to get geotechnical engineers that would say that the new building on the north side of the ravine would be safe from retrogressive landslides.

¶ 55 In his quest to obtain from the Municipality a building permit allowing construction of a new building to the north of the ravine, Lamadeleine first retained the services of the defendant Jacques Whitford Limited. The report eventually prepared by that defendant in the persons of engineers Charles Kwok and Raymond Hache is dated October 31, 1990 and is located at Tab 72 of Exhibit 4. Mr. Kwok gave evidence on behalf of the defendant Jacques Whitford. He is 41 years of age, obtained his Bachelor of Civil Engineering in 1982 and his Masters in Geotechnical Engineering in 1984. He has been associated with Jacques Whitford since 1988. After receiving the initial call from Lamadeleine, Kwok and Lamadeleine attended at the site. He and Lamadeleine either drove or walked the forest road on the west side of the property to the crest of the slope which is about twenty meters from the river's edge. They then went to the building site where the previous building had burned down and Lamadeleine asked Kwok to do a geotechnical investigation with respect to that location. At page 3 of the report it is noted that the scope of work for the investigation described is as follows:

> (a) to investigate the soil conditions at the proposed site;
> (b) to survey the gully immediately adjacent to the proposed site in order to determine slope stability; and
> (c) to provide geotechnical recommendations for the design and construction of the proposed structure.

Kwok at trial testified that the scope of work did not include an assessment of the slope stability at the banks of the river. Notwithstanding that evidence, Kwok included in Section 6.1 of his report under the heading Geotechnical Assessment, the following opinion:

> ... The stability condition of the Nation River located approximately 350 meters north of the proposed restaurant is not of concern. It is not expected that instability of the riverbank will jeopardize the proposed building at the location investigated. Presently, the slope shows no signs of erosion, however should erosion occur in the future control measures should be implemented in order to maintain a safe slope stability.

¶ 56 As it turns out at some point prior to the delivery of the report Kwok had a telephone discussion with Lamadeleine in which he told Lamadeleine that the report was pretty close to being ready. At that point Lamadeleine told him that he, Kwok, had to address the stability conditions of the South Nation River because this was very important to Lamadeleine. Kwok at that point in time appreciated that this was not part of the original mandate. He had looked at the riverbank at that one location on the Forest Road that runs along the west boundary of the lands but he was not looking at retrogressive failure as part of his mandate at the

time. He gave his opinion with respect to slope stability in paragraph 6.1 of his report without having examined the shore line and without having made any slope stability assessment. The 350 meter distance referred to in paragraph 6.1 had been obtained by Kwok from a drawing that had been provided to him by Lamadeleine and he felt that this distance would put the building far enough away from the river and that there would be no problem. In fact the actual shortest distance from the proposed building site to the river's edge was 170 meters.

¶ 57 At Tab 73 of Exhibit 4 is the letter of transmittal to Lamadeleine which accompanied the Jacques Whitford report. After delivery of the report Lamadeleine came into the Jacques Whitford offices with the letter of transmittal and with another page attached thereto which contained a suggested paragraph to be included in the Jacques Whitford report. Lamadeleine explained that the suggested paragraph had been authored by one Dr. Lagarec, a geo-manphologist, who was doing some work for the Municipality and who had seen the subject property and whose opinion it was that it was safe to build north of the ravine. All of the handwriting on the two pages at Tab 73 is Lamadeleine's and it advises Kwok that he must include in his report that he is aware of a possible landslide such as indicated in the Golder Report but maintain that the building should not be jeopardized by the Nation River. On page 2 of Tab 73 Lamadeleine notes:

> This note would permit me to obtain a building permit and at the same time allowing you plenty of room in your report.

¶ 58 In his discussions with Lamadeleine on that date, Kwok told him that he had not looked at the river from the point of view of retrogression. Lamadeleine in turn indicated to Kwok that he would have to put in the "Dr. Lagarec paragraph" because he had already advised with respect to the slope stability at the river and it would look silly if he didn't include it in his report. Kwok in his response told Lamadeleine that he was not going to change his report but at the same time he was concerned about retrogression and he told Lamadeleine that he would look at the Golder Report and write an addendum. To that point in time Kwok had no material from Golder Associates nor had Lamadeleine ever told him about the site specific Morey report nor did Kwok know that Golder Associates had been doing studies on the river for years. On that day Kwok requested a copy of the Golder Report referred to in the "Dr. Lagarec paragraph" and in response Lamadeleine provided him with the Golder Report dated September 1988 to the Authority. It was in a subsequent telephone discussion with Grant Decale from the Authority that Kwok learned of the site specific report of Morey prepared for Lamadeleine.

¶ 59 Kwok and his associate Hache had both Golder Reports within a week or so and read them.

¶ 60 At Tab 66 of Exhibit 4 is a letter from Lamadeleine to Kwok received at Jacques Whitford probably before Hache and Kwok went onto the site again. In the letter Lamadeleine says:

> I want you to tell me in a letter that you still believe that the set back which is about 350 meters is still adequate and should not jeopardize in your opinion the construction of my theatre restaurant which is one story high.

Lamadeleine closes this letter by saying:

> I think it is reasonable what I am asking and once I receive this amendment and the reports I left with you then I will mail a cheque immediately.

¶ 61 Kwok in his evidence explained that he wanted to address the slope stability portion of his report dated October 31, 1990 because he was not prepared to leave it the way it was in that it was "wide open" and he hadn't looked at it from the point of view of retrogressive landslide and therefore felt his report should be qualified.

¶ 62 About a week before November 22, 1990 he and his associate Hache went to the site. They accessed the property from the Forest Road on the west side of the property and walked from there east along the bank looking at the terrace and the slope angle and tree cover. He believes that they walked not very far past the east property line of the subject property.

¶ 63 At Tab 76 of Exhibit 4 is the letter sent by Kwok to Lamadeleine dated November 20, 1990. In this letter Kwok locates the South Nation River as "some 200 meters north (shortest distance rather than measured parallel to the property line) of the building site" which is still twenty or thirty meters more than the actual shortest distance. While the letter recognizes that one cannot completely rule out the possibility of a future landslide similar to the 1971 and 1910 slides, "anywhere along this stretch of the river", Kwok opines that:

> Provided that the existing site conditions are unaltered the risk of a retrogressive failure jeopardizing the proposed restaurant is very low. Restrogressive failure at this site would likely be confined within the mid slope terrace.

In the letter he identifies the site as having a mid slope terrace some eight meters or less above the river level. He describes the width of the terrace as being narrowest at the east end of the property where it is about thirty five meters wide and increases toward the west. He expresses the opinion that the terrace is considered important when considering potential retrogressive failures and provides an explanation for his opinion.

¶ 64 The letter of November 20th notes "The presence of vegetation along the riverbank and throughout the entire lot ..." which Kwok considers to be an important contributing factor towards stability of the site.

¶ 65 Kwok in the letter notes that the riverbank conditions immediately east of the site are rather different and that the possibility of a retrogressive failure at that site has not been investigated. He acknowledges that a failure upstream could possibly jeopardize a portion of the present site but goes on to say as follows:

> However it is also noted that a ravine is present between the proposed restaurant and the east property line. A ravine such as the existing one may act as a potential barrier of retrogressive failure.

¶ 66 It should be pointed out that in his evidence geotechnical engineer Dr. Lefebvre, called by the defence, confirmed that there is no such ravine which would provide protection to the building in its present site and I find that to be a fact.

¶ 67 The letter of November 20, 1990 closes with the caveat that:

> As a condition of constructing the restaurant at the proposed location, we recommend an annual inspection be carried out to assess the stability conditions of the lower slope. Such inspection should be conducted in the spring and should consist of detailed photographic records of conditions such as erosion and other signs of distress. Should the inspections reveal adverse conditions, remedial measures may be required. Removal of vegetation should not be carried out anywhere within the property.

¶ 68 Lamadeleine brought the letter of November 20th back to Kwok with revisions as marked on the copy at Tab 6 of Exhibit 25. What Lamadeleine had done was to completely erase the third paragraph on page 2 of the letter wherein Kwok references the conditions immediately east of the site as being rather different and advising that the possibility of a retrogressive failure at that site had not been investigated and that failure upstream could possibly jeopardize a portion of the present site. As well, Lamadeleine had struck out the last paragraph of the letter which had indicated that as a condition of constructing the restaurant at the proposed location there be annual inspections carried out to assess the stability conditions of the lower slope.

¶ 69 At Tab 80 is the letter dated November 22nd from Kwok which represents the last communication with Lamadeleine. The letter of November 22nd changed the letter of November 20th by substituting the concluding paragraph with the following. In the November 22nd letter the last paragraph read as follows:

> Should the conditions of the riverbank (such as erosion, etc.) change in the future the overall stability of the site should be assessed at that time. Remedial measures may be required accordingly. Presently removal of vegetation should not be carried out anywhere within the property.

So it is apparent that Kwok co-operated with Lamadeleine to a certain extent by removing from the letter of November 20th the condition that there be an annual inspection carried out to assess the stability conditions of the lower slope.

¶ 70 On cross-examination Kwok conceded that he knew his retainer was with respect to the construction of the building on the burn out site north of the ravine and knew also that the purpose of the report was to obtain a building permit. In cross-examination Kwok testified that at the time he was of the opinion that "it would be a gamble" to construct the building on the proposed site north of the ravine and that was the thought he was trying to convey in his letter of November 22nd.

¶ 71 In cross-examination Kwok conceded that the November 22nd letter was intended to address the slope stability at the river but that he had done no testing in that respect. I do not accept his subsequent evidence that he did a retrogressive distance calculation using the Mitchell formula with the result that he calculated the retrogressive distance to be about a hundred

meters from the shoreline. Kwok was unable to produce any such calculations.

¶ 72 Having received the Jacques Whitford report dated October 31, 1990 which for his purposes was not satisfactory, Lamadeleine went ahead and retained the defendant John D. Paterson and Associates Ltd. The retaining letter is dated November 8, 1990 and is at Tab 74 of Exhibit 4. It reads in part as follows:

> Testing my land to put a building to know if it is safe also to check the river's slope because there is a lot of discussion going on about it the Nation River. To make a long story short find out if it is safe to put a building, tell me what would be the total cost before you come down.

¶ 73 Steven Walker gave evidence on behalf of this defendant. He is the President of John D. Paterson and Associates Ltd. He graduated in 1978 from Queens University in Geological Engineering. He has been employed by Paterson since then. His work is primarily geotechnical engineering and Paterson specializes in geotechnical engineering. Before 1990 the company had done work along the river and was aware of the situation with respect to landslides. It was aware in 1990 that Golder Associates had been retained by the Authority with respect to a study along the river but had never seen any of Golder's published reports.

¶ 74 Exhibit 43 is a note made by Walker's associate Stewart on November 6, 1990 recording a telephone call with Lamadeleine. The understanding was that Lamadeleine was putting up a new building some distance from the South Nation River, wanted a bore hole sunk, and wanted to determine soil conditions under the building and if it was a safe distance from the slope of the river. In this memo it is noted that the building is 1250 feet from the river.

¶ 75 Walker undertook the project and dispatched forces to the site. Walker did not go to the site itself but rather sent a technologist, one Mulcher, who was to put down a bore hole and examine the condition of the slope and take some survey cross sections of the slope. As Walker explained in his evidence, in order to properly assess the slope, one must know the geometrics of the slope including height and angle.

¶ 76 Lamadeleine provided the technologists with a copy of the site specific Golder Report. The report was incomplete in that it did not contain a copy of the actual site plan which is located at page 156 of Tab 23, Exhibit 4. The site plan provided by Lamadeleine did not show the location of the bore hole as does the site plan in the Golder Report and as well the site plan provided by Lamadeleine does not have the title "Golder Associates" imprinted thereon.

¶ 77 It was Walker's task to review the information received from Mulcher together with the bore hole information. It was Walker's evidence that his analysis using conservative assumptions and high pore water pressure produced a factor of safety of 1.4 which he considered quite satisfactory.

¶ 78 At Tab 75 of Exhibit 4 is Walker's initial letter to Lamadeleine dated November 19, 1990 reporting his preliminary findings. In the opening paragraph of that letter Walker identifies the proposed building site as being located "greater than 340 meters from the crest of the South Nation River". It was Walker's evidence that he got to this distance from the drawing given to him by Lamadeleine which shows the distance from the east west ravine to the river to be approximately 1200 feet. He was aware at the time that that distance was parallel to the property line. He did not compute the shortest distance from the proposed building site to the river.

¶ 79 Walker in the letter acknowledges that he has reviewed the site specific Golder Report and has used the factual data to assist in his analysis. He then advises Lamadeleine as follows:

> After reviewing the data in that report, and on the basis of our findings, it is our opinion that the proposed development complies with the concerns that have been expressed regarding development along the South Nation River.
> At this time our final report on the matter has not been completed; however our calculations indicate that the proposed structure is set back a distance that is more than adequate to buffer the structure against a possible slope failure, should it occur. As such, it is the opinion of this firm that you should proceed with the proposed Sucrerie Theatre. Our formal report on the matter will be issued later this week.

¶ 80 In his evidence Walker explained that the concerns being referred to in his letter were that there was a study area that did not allow development unless there was confirmation of safety by way of a site specific study. As well, he was aware that there had been preliminary information from the Authority setting out set backs.

¶ 81 Walker in his evidence explained that in arriving at a factor of safety of 1.4 against rotational failure, he assumed full hydrostatic saturation with horizontal flow or, in other words, high pore water pressure which was unlikely to develop. He explained that if the pore water pressure drops then the factor of safety goes up. In other words, he assumed the worst pore water pressure of .6 for the purpose of his calculations. He testified that it was more likely that the pore water pressure would be significantly lower, perhaps .4 which would have the effect of raising the factor of safety significantly from 1.4 to perhaps 1.7 or more.

¶ 82 At Tab 77 of Exhibit 4 is the typewritten paragraph authored by Dr. Lagarec with Lamadeleine's handwritten note "This is important in order to obtain my building permit but it gives you plenty of room". The Lagarec paragraph reads as follows:

> The recommendations made on this report are in accordance with our present understanding of the project and a soil investigation is a limited sampling of a site, and after reading the Golder Report, we agree that there is always the possibilities of landslide along the Nation River, however, after viewing the site such as the gullies, natural berm at the river, the land being forested and drained, and adding the distance from the river, we still believe that the type of the building proposed at the site is secure.

¶ 83 The paper at Tab 77 was brought to Walker by Lamadeleine sometime between the letter of November 19, 1990 and the delivery of Walker's formal report. Lamadeleine advised Walker that he needed that paragraph in the conclusion of the formal report.

¶ 84 At Tab 79 of Exhibit 4 is Walker's final report dated November 22, 1990. In its introduction Walker continues to locate the proposed building site as being 340 + or - meters from the crest of the slope when in fact the shortest distance from the site to the river taken perpendicular to the river was 170 meters. As well in the introduction Walker acknowledges Golder's site specific report and says the following:

> ... The site had been identified as being potentially susceptible to retrogressive slope failures in that report, and a set back distance of 400 meters was recommended. The purpose of this study was to provide a further delineation of the subsurface conditions, and to conduct the appropriate stability analysis to provide for a refinement of the previously established set back.

¶ 85 After detailing the work that had been done by the technologists on site and in the lab, Walker, on the last page of his three page report, states the following:

> The Golder Report addresses the theory behind retrogressive slope failures which is of particular concern between Casselman and Lemieux. However for a retrogressive type failure to occur, an initial slope failure is required. Our calculations indicate that the factor of safety against an initial rotational failure occurring is of the order of 1.4 which is considered to represent a marginally stable slope condition. This analysis was conducted using excessively high pore water pressure conditions that are likely never to develop in the slope.

¶ 86 Under the heading CONCLUSION the report states the following:

> Based on the results of this study, it is the opinion of this firm that the slopes bordering the South Nation River at this particular site are not, in their present condition, considered to be unstable. It is also our opinion that should a failure of the banks occur, it would not retrogress back to the location of the proposed building.

[It should be noted that notwithstanding this expression of opinion at no time during the course of his investigation did Walker do a retrogression distance calculation]

¶ 87 The final paragraph of the report states the following:

> The conclusions contained herein are provided in accordance with our present understanding of the project and are based on our delineation of the subsurface conditions at the building location. We have reviewed the Golder Associates Report #881-2486 and agree that there is always the possibility of landslides occurring along the South Nation River; however, after examining the site conditions (i.e. gullies, slopes, etc.) and the lands being forested and well drained, it is our opinion that the proposed building is sufficiently set back from the river so that should a failure occur, the building would not be adversely affected.

[Obviously this was an attempt by Walker to accommodate Lamadeleine's request that the "Lagarec paragraph" be incorporated into his final report]

¶ 88 Walker, never having attended the site prior to his final report, explained that he would have gotten from the technician the information that the lands were forested and well drained. As well, the reference to the property being well drained would have come from the information from both Golder's bore hole and Paterson's bore hole.

¶ 89 The following was disclosed by Walker in cross-examination.

¶ 90 He knew that the purpose of his report was to enable Lamadeleine to get a building permit for a restaurant theatre which would see high use in the springtime. He instructed his technologist, Mulcher, to confine his investigation to the plaintiff's property. He does not like to trespass on other property without permission. He never asked permission from adjoining land owners to go onto their property and indeed he had no interest in seeing the adjoining property unless it could be seen from Lamadeleine's property. Although he and his technologist knew that the land which was closest to the river was not on the plaintiff's property, in their opinion retrogression was not a problem and therefore they restricted their investigation to the plaintiff's property. He conceded that the risk of initial slope failure has nothing to do with property lines. He conceded that one of the parameters in dealing with initial failure of the slope is the steepness of that slope and that it was accordingly relevant to know whether the plaintiff's slope was steeper or not when compared to the neighbour's slope. He conceded that if the slope to the east of the plaintiff's property is steeper than the plaintiff's slope that might change the calculation of the factor of safety. The factor of safety of 1.4 was arrived at using very conservative assumptions. He was of the view that in reality the factor of safety would be higher. As a result he felt no need to do a calculation of retrogressive distance. He does not know whether he would have done a calculation of retrogressive distance if the factor of safety had been 1.3. He did concede that if the factor of safety had been 1.2 he would have done a calculation of retrogressive distance. He conceded that his associate Tovell, in assessing for the National Bank of Canada a slope in connection with a house located in the south east corner of the plaintiff's property in a report dated October 11, 1991, found a minimum factor of safety in the order of 1.06 based on the slopes becoming fully saturated and using excessively high pore water pressure conditions (i.e. horizontal ground water flow) that are likely never to develop in the slope. (See Exhibit 45). He conceded that at the time of his report he was unaware of the retrogressive slide that had occurred just west of the plaintiff's property sometime during the 1800's. It was his evidence that had he known of that slide, it would have been of interest to him but would probably not have resulted in any different conclusions. He conceded that if, through his calculations, he arrived at an overall slope factor of safety at the riverbank at 1.06, then he would likely have done a retrogressive distance analysis.

¶ 91 All of the Paterson and Jacques Whitford reports and letters were provided to the Municipality. The Municipality, by way of a letter to Lamadeleine dated December 5, 1990 (see Tab 83, Exhibit 4), advised Lamadeleine that a resolution had been passed to the effect that based on the reports of Jacques Whitford, Paterson and Lagarec, the reconstruction north of the ravine appeared to be secure and that a building permit would be issued for that location. It should be noted that while Dr. Lagarec did not testify at this trial, his report dated November 15, 1990 is at Tab 3 of Exhibit 25 and reads in part as follows:

> In summary, in the present case, the actual geo-morphemic and hydrological conditions are not favourable to landslide occurrence and the material properties indicate a limited potential retrogression. It would need a very important change in river dynamics to create such conditions. So I think that you can build where you planned to do it as long as the load is not excessive and well distributed.

¶ 92 Interestingly by the time Lamadeleine received the Municipality's letter dated December 5th he had already started construction on the north side of the ravine. At Tab 81 is the building inspector Brisson's report dated November 27, 1990 relating to the inspection of the footings and at Tab 82 is the building inspector's report with respect to the tile drains dated November 29th. In any event, in due course Lamadeleine's application for a building permit to construct the combination theatre restaurant on the south side of the ravine was amended to replace the word "south" with the word "north", the amendment being initialed by the building inspector Brisson and the building permit at Tab 70 of Exhibit 4 given to Lamadeleine.

¶ 93 Construction of the restaurant theatre was completed in January of 1991 and the business operated in the normal course beginning at that time.

¶ 94 It should be pointed out that when Lamadeleine took it upon himself to construct the new theatre restaurant on the north side of the ravine, he was quite aware that the Authority objected to that course of conduct. Lamadeleine acknowledged to Mr. Rasmussen, counsel for the defendant engineers, under cross-examination that his property has been in

a hazard zone since 1982 except for the short period of time when it was taken out of the zone in 1996 after he convinced the Municipality's planner to redraw the line. Lamadeleine acknowledged to Mr. Rasmussen that even after the new building was constructed to the north of the ravine he continued to inform the Municipality of his concern that his lands were included in the hazard zone.

¶ 95 Lamadeleine continued to press the Municipality to have his property excluded from the hazard zone.

¶ 96 At Tab 95 of Exhibit 4 is the Municipality's Notice of the Passing of an Official Plan Amendment. The notice advises that council passed by-law 24-95 on the 10th of October 1995 adopting proposed official plan amendment #51 and further advising that the implementing zoning by-law would zone the lands contained within the landslide potential area as hazard lands. At Tab 98 is the by-law 25-95 which, by Schedule A thereto, indicated the hazard lands, effectively removed the plaintiff's land from the hazard zone. As a matter of interest at Tab 103 is a resolution of the Township that in by-law 25-95 the term "hazard" be deleted and the word "study" be inserted in its place.

¶ 97 When the draft of by-law 24-95 was presented to the Authority in July of 1995, the map schedule attached to it indicating the hazard zone included the plaintiff's lands. In the Spring of 1996 the Authority was made aware that the amendment actually passed by the Municipality was different from what had been approved by the Authority and served to exclude the plaintiff's lands from the hazard zone. At Tab 112 of Exhibit 4 is a letter from the Authority to the OMB outlining the Authority's position which letter was copied to the Municipality.

¶ 98 The zoning by-law had been appealed to the Ontario Municipal Board and the Authority had sought and obtained status as a party at the hearing which was scheduled to be held in February of 1997.

¶ 99 Eventually solicitor Alan Cohen was retained by Lamadeleine to support the Municipality in the appeal to the OMB by the Authority against the line as it was then drawn and which at that time excluded the plaintiff's land. Lamadeleine retained Gordon C. McRostie, professional engineer of the firm McRostie Genest St. Louis to make a geotechnical study and to reply to two questions posed by solicitor Cohen. The two questions were:

1. Is the present theatre building on the property safe?
2. If the building is not safe, what remedial work is required to make it safe?

¶ 100 McRostie's report is at Tab 129 of Exhibit 4. In his report dated January 9, 1997 McRostie essentially agrees with the Morey on-site study. McRostie, after investigation, was of the view that the building in its location north of the east west ravine was not safe at certain times of certain years. He was also of the view that the remedial work required to make it safe would cost in excess of a half million dollars.

¶ 101 In the face of the McRostie report and the Morey site specific report, Cohen decided that it would not be wise to go to the OMB to defend the present location of the hazard line which excluded the plaintiff's property. The OMB had from the Authority a detached expert who would testify with respect to a model that the Authority was treating as accurate and Cohen did not think that the OMB would reject that model and accept the Paterson and Whitford models. McRostie had declared the building unsafe and Cohen felt that even if he could convince the OMB that the new line was the correct one, that would still leave the plaintiff's building in what Cohen knew from all of the evidence to be a hazard zone. Cohen, in his view would in fact be responsible for the lives of hundreds of people and he refused to accept that responsibility.

¶ 102 Cohen advised Lamadeleine to consult with his insurer and further advised his against using the property for any reason.

¶ 103 Cohen in his evidence pointed out that Lamadeleine had agreed with him that there was no point in fighting the issue before the OMB however it had been agreed that the Township would call Paterson and Jacques Whitford at the OMB hearing to defend the new line which excluded the plaintiff's property. Cohen and the plaintiff attended the OMB hearing but did not seek party status which would have given them the right to cross examine, call evidence, argue, and render themselves susceptible to costs. They did have status as a participant who could come and go and, with the board's permission, ask questions.

¶ 104 The OMB hearing was, from Cohen's point of view, very unusual. Initially the Board had an in-camera meeting with the solicitors for the Authority and the Township. The Board then re-opened and land use planning evidence was called. There was then another in-camera meeting with council for the Authority and the Township. The Board then re-opened and said that it did not need to hear geotechnical evidence, that this was a planning problem only, that the hazard line was not correct, and

that the Authority had the power to relocate the hazard line. The line was accordingly relocated.

¶ 105 In its reasons at Tab 140 of Exhibit 4 the Board points out the following. Sometime between mid-August and mid-September 1996 the plaintiff came to see the Township's consultant planner, Mr. Miguelez, and asked him to make the hazard line on his property less restrictive or closer to the river. Mr. Lamadeleine had based his request on two studies that had been done for him; the Paterson Report and the Jacques Whitford Report. It was Mr. Miguelez's evidence before the Board that Mr. Lamadeleine assured him that the Authority had reviewed those reports and was in agreement with them. Miguelez reviewed the reports, concluded that they were geotechnical investigations as foreseen in the OPA 51 policy and redrew the line on the Lamadeleine property based on his interpretation of the reports. He did not contact the Authority but rather relied on Lamadeleine's statement that the Authority was satisfied. It was the less restrictive line that formed part of OPA 51 and by-law 25-95 when adopted by council. The Authority became aware of the change when they were approached for a clearance certificate on the property. The Authority then became a party to the OMB hearing because it took the position that the less restrictive line did not adequately reflect the landslide potential on the plaintiff's property. Mr. Miguelez was very clear that had he known the Authority was not satisfied with the Paterson and Jacques Whitford Reports, he would not have moved the line.

¶ 106 In his evidence Mr. Cohen agreed that the whole concept of the hazard line was to identify the area that had potential for retrogressive landslides. He acknowledged that even if a particular site was in the hazard zone, under the provisions of the official plan and by-law, the site could be developed and built on in the face of a site specific report finding it to be safe. Indeed, at page 4 of its decision, the OMB states the following:

> The intent of the landslide potential area is to require appropriate studies not to prohibit development out right. There is, therefore, no policy need to change the demarcation of the area on an ongoing basis. As well, I am not satisfied that a study area policy line should be moved based on site specific geotechnical studies. Such studies are generally designed to test whether a particular structure or other development can be built without risk. They are by their nature specific to time, place and structure. They are not designed to show that no other development ever would be at risk and that no study is needed for a future unknown development and time.

¶ 107 It was Lamadeleine's evidence that following the decision of the OMB, putting his property back in the hazard zone, he believed that he would have a hard time operating the business and that he had to consider closing in view of the fact that there would be no insurance for a landslide. He added that prior to the OMB meeting he believed that the property was safe but now he is not satisfied with the safety of his land and feels that he cannot operate the business again because of the danger to the people. It should be noted that it is clear on the evidence that notwithstanding Lamadeleine's advice to his insurer following the OMB hearing, advising the insurer that his land was in a hazard zone, the only coverage that was deleted from the policy by the insurer was property damage due to landslide. All other coverage remains in place including liability coverage. It should also be noted that at no time prior to the OMB hearing in February of 1997 did Lamadeleine advise his insurer that he was in a landslide hazard zone although he knew that to be the case from the beginning.

¶ 108 Lamadeleine finally terminated his business activities on the property in August of 1997 and the building has not been used since that time.

¶ 109 I will deal now with the liability of the Municipality.

¶ 110 It is clear from the evidence of Denis O'Grady, General Manager of the South Nation River Conservation Authority since 1987 and the documents, that the Township was, at all material times, aware of the Authority's position that there should be no construction on the plaintiff's lands to the north of the ravine. The Township was repeatedly advised by the Authority of that position.

¶ 111 At Tab 24 of Exhibit 4 is O'Grady's letter to Roger Brunette, Clerk of the Township of Cambridge, dated November 18, 1988. That letter is of particular interest in that it clearly brings home to the Municipality the Authority's concern about new construction or additions to existing buildings in the set back area. The letter reads in part as follows:

> Concerning the above the South Nation River Conservation Authority is of the opinion that based on present available information any further construction in the earth flow zone i.e. that area designated as sensitive slope protection with set backs of 600 and 800 meters in your comprehensive zoning by-law 144-88 is not advisable.

¶ 112 The letter then refers to the Golder study which is ongoing and says:

> Until such time as this study is completed all new construction or additions to existing buildings should be put off.

¶ 113 The letter goes on to say that one of the most critical factors affecting the stability of slopes is the amount of weight added to the top of the slope which in turn increases the stress on the bank thus increasing the possibility of an earth flow or landslide. The letter closes with the following:

> The South Nation River Conservation Authority hopes that the Township of Cambridge seriously considers the above comments.

¶ 114 In his evidence O'Grady explained that the Authority had no authority to prohibit construction as such.

¶ 115 At Tab 29 of Exhibit 4 is an internal memo of the Authority dated March 15, 1989. The memo is from Graham Decow, Project Co-ordinator, to the Executive Committee Directors. The memo notes that on Monday, March 13, 1989 Authority staff met with members of Cambridge Township Council to discuss a number of requests the Township had received from residents living within the designated earth flow zone for building permits. The recommendation coming out of that meeting was that until Fill and Construction Regulations were in place for Cambridge Township and a policy statement prepared to control development, the Authority strongly recommended that building permits for any structure within the designated earth flow zone not be allowed. It is of particular interest to note that that resolution was moved at the meeting by Robert Gratton who was, at the time, a council member of the Township of Cambridge. A copy of this memo was sent to Roger Brunette, Clerk of the Township of Cambridge, within the week.

¶ 116 At Tab 45 of Exhibit 4 is a letter from the Authority to the Clerk of the Township of Cambridge, dated June 2, 1989 referring to the Casselman to Lemieux study and the updated set back line. The letter notes that further to a discussion between Brunette and the author, Lynn Preston, Lands Co-ordinator, the day before, it was the opinion of the Authority that the set backs for the earth flow or landslide potential zone as covered by the study are those as delineated as the study area on the map prepared by Golder Associates and enclosed in the letter sent to the Township and dated May 25, 1989. The letter of June 2 goes on to point out that this line represents not only the maximum potential retrogressive landslide area but for the Authority's purposes will also be used as and be sufficient for a set back for all new development. The letter goes on to read as follows:

> In other words the South Nation River Conservation Authority will discourage any and all new development within this setback area. This setback may be amended pending further studies such as the presently ongoing environmental study report. Until the time that these studies are completed, the South Nation River Conservation Authority will use the study area line as the setback.

¶ 117 O'Grady, in his evidence, testified that there was no doubt that the Golder line encompassed all of the plaintiff's property including the building to the north of the ravine. As well, O'Grady explained in his evidence that by this point in time there was great deal of acrimony between the Municipality and the Authority.

¶ 118 At Tab 64 of Exhibit 4 is a letter from the Authority to the Clerk of the Township, Brunette dated September 20, 1990. The letter is with specific reference to a "Building Permit on the Property of Conrad Lamadeleine, Lot 17, Concession 5." The letter refers to Mr. Brunette's concern with respect to redevelopment at the site of the summer theatre, refers to Golder's site specific report which identifies the area of the site which is considered safe from landslide retrogression due to the presence of the ravines, and closes with this paragraph:

> Redevelopment is possible here as long as the conditions outlined in the Golder Report are observed i.e. construction in that area deemed safe by the presence of ravines.

¶ 119 At Tab 78 is a letter from the Ministry of Natural Resources to the Township dated November 21, 1990. This letter would have been written after the delivery of the first Jacques Whitford Report but before delivery of the Jacques Whitford letter dated November 22. The subject of this letter is "Township of Cambridge, Lot 17, Concession 5, Geotechnical Investigation R. Conrad Lamadeleine" and reads as follows:

> We have the following concerns regarding the above report by Jacques Whitford Limited based on review of its contents, a review of the previous Golder Report for the same site and a site visit on November 9, 1990.

Caselaw

> It is apparent that no regrading or protection of the river's shoreline, as previously advocated in the Golder Report, had been carried out leaving the banks susceptible to an initial failure. This could lead to a retrogressive failure effecting this property.
> Since proposed construction is north of the ravine it is considered that the ravine cannot be considered to protect the proposed structure. The statement in section 6.1 of the Whitford Report that instability of the (South Nation) riverbank is not expected to jeopardize the proposed building does not appear to be relevant when it is apparent the firm was not provided with available information concerning the retrogressive slides in the area.
> The area should be still considered within the earth flow designation and new development should be discouraged.

¶ 120 At Tab 57 is a letter from the Authority to the Township dated September 28, 1989. The letter reads as follows:

> Further to the discussion during the council meeting of September 25, 1989 research into our files indicates that the geotechnical firm Golder Associates was hired by Mr. Lamadeleine to evaluate and provide an assessment of the stability of the bank of the South Nation River.
> The study determined that the area in question was underlain by sensitive silty clays that were susceptible to flow sliding and that active erosion is presently occurring along the banks of the South Nation River. Golder's study also revealed that a portion of the property is naturally protected by the presence of two ravines which act as a barrier and would retard or terminate any local flow slides. The location of this naturally protected area is south of the existing dance hall and south of the ravine which extends east to west there. The report continues to state that if the proposed building were to be located in this naturally protected area the actual site should be approved by the geotechnical engineer.
> At no point in this report did it state that the dance hall was considered a protected area, naturally or otherwise, nor did it state that the remedial works proposed i.e. the extension and deepening of the ravine running to the south of the dance hall would protect this building.
> It appears that Mr. Lamadeleine has improved and expanded his dance hall which is in the landslide potential zone. This may have serious implications should a landslide occur.
>
> The South Nation River Conservation Authority would hope that all efforts are made in the future to ensure no further development occurs in this potentially hazardous area.

¶ 121 It seems almost unbelievable that in all of the circumstances the Township would go against the advice of the Authority and MNR and issue a building permit allowing the plaintiff to construct the new theatre restaurant to the north of the ravine. On the evidence there is no explanation as to why they did so. The building inspector, Brisson, was not called to give evidence at trial. Nor was the Town Clerk Brunette. Nor was any member of council. Nor was Dr. Lagarec who it appears was advising council on this matter.

¶ 122 Why the Township would ignore the Authority's recommendations with respect to the plaintiff's property becomes an even greater mystery when one notes that it sought specific recommendations from the Authority with respect to its own properties. At Tab 61 of Exhibit 4 is a letter from the Township to the Authority dated November 30, 1989 referencing the Casselman to Lemieux environment assessment study which letter reads in part as follows:

> 3. Members of council would appreciate a specific study to determine early in 1990 the level of risk along our municipal road that are in the hazardous zone because the municipality would have the intention to improve and reshape the hills on the road allowance between Concessions 1 and 2.

The letter closes with the following:

> Hoping to receive an early reply, please accept our best regards.

¶ 123 It should also be noted that in issuing the building permit in defiance of the recommendations of the Authority and the MNR the Township acted with complete disregard for and in direct contravention of its own resolution passed September 6, 1989 at a council meeting. The resolution can be found at Tab 55 of Exhibit 4 and reads in part as follows:

> For all such site specific studies, the terms of reference shall be approved by the Ministry of Natural Resources and the South Nation River Conservation Authority. The study shall be conducted to the satisfaction and approval of the Ministry of Natural Resources and the South Nation River Conservation

Authority.

¶ 124 While we will never know in this case why the Township issued the building permit for construction of the new theatre restaurant to the north of the ravine, none of the available witnesses having been called, I am left to infer that if Brisson, Brunette or members of the Township council had been called to testify, they would have exposed facts unfavourable to the Township.

¶ 125 In all of the circumstances I am satisfied that in issuing the building permit to the plaintiff for construction of the restaurant theatre to the north of the ravine, the Township acted negligently.

¶ 126 In Kamloops v. Neilson et al (1984) 10 D.L.R. (4th) 641 (S.C.C.) Wilson J., Ritchie and Dickson J.J. concurring pointed out that in order to decide whether or not a private law duty of care was owed by a local authority, two questions must be asked:

(1) Is there a sufficiently close relationship between the parties (the local authority and the person who has suffered the damage) so that, in the reasonable contemplation of the authority, carelessness on its part might cause damage to that person; and
(2) If so, are there any considerations which ought to negative or limit the scope of the duty, the class of persons to whom it is owed or the damages to which a breach of it may give rise.

¶ 127 Referring to the House of Lords Decision in Anns v. Merton Londonborough Council [1978] A.C. 728, Wilson J. pointed out that in Anns Lord Wilburforce said that questions 1 and 2 above must be answered by an examination of the governing legislation and categorized the various types of legislation as follows:

(a) statutes conferring powers to interfere with the rights of individuals in which case an action in respect of damage caused by the exercise of such powers will generally not lie except in the case where the local authority has done what the legislature authorized but done it negligently;
(b) statutes conferring powers but leaving the scale in which they are to be exercised to the discretion of the local authority. Here there will be an option to the local authority whether or not to do the thing authorized but, if

¶ 128 Section 210, paragraph 164 of the Municipal Act provides that by-laws may be passed by the councils of local municipalities "... for the issuing of a permit certifying to such approval without which permit no building or structure may be erected, altered or repaired, and for authorizing the refusal of a permit for any building or structure that if constructed would be contrary to any by-law of the municipality or of any other municipality, including a county and a metropolitan municipality, or the laws of Ontario or Canada in force in the municipality."

¶ 129 Section 5(1) of the Building Code Act provides that no person shall construct a building in a municipality unless a permit has been issued therefore by the chief official. Section 10(1) of the Building Code Act provides that an inspector may enter in or upon any land at any time without a warrant for the purpose of inspecting any building to determine whether such a building is unsafe.

¶ 130 Clearly then, municipalities have wide powers over the issuing and revoking of building permits and the law recognizes that municipalities have a clear responsibility for the health and safety of their citizens. On the facts of this case the defendant Township took that duty seriously when contemplating construction in the hazard zone and imposed upon themselves a requirement to consult and obtain the approval of the Authority and MNR when they received an application for a building permit to construct in the hazard zone. See Resolution 473 previously referred to.

¶ 131 In my view the test in Kamloops is satisfied in this case. There was a sufficiently close relationship between the defendant Municipality and the plaintiff so that in the reasonable contemplation of the Municipality, carelessness on its part might cause damage to that person and there are no considerations which ought to limit the scope of the duty, the class of persons to whom it is owed, or the damages to which a breach of it may give rise.

¶ 132 The defendant Township elected to exercise the power conferred upon it by the Municipal Act and the Building Code and required that site specific geotechnical studies be conducted to the satisfaction of the Authority and the MNR prior to the issuance of a building permit.

¶ 133 There was imposed on the defendant Municipality a private law duty of care towards individuals including the plaintiff seeking to construct in the hazard zone. As such, the defendant Township had a duty to exercise the standard of care of an ordinary, reasonable and prudent person in like circumstances. The defendant Township was aware of the potential risk and the consequences of such a risk coming to pass. The defendant Township was aware of the position of the Authority and the MNR and their opposition to the theatre restaurant being constructed north of the ravine. The Township was fully aware of Golder Associates general concern with respect to retrogressive landslides on the South Nation River and Golder Associates' specific concern with respect to the plaintiff's lands. The defendant Municipality was negligent in issuing to the plaintiff the building permit in the face of all these circumstances. As well the defendant Municipality was negligent in failing to ensure that the studies conducted by Paterson and Jacques Whitford had been conducted with the approval of and to the satisfaction of MNR and the Authority prior to issuing the building permit. As it turns out, had the Municipality made appropriate inquiries, it would have been made clear to them that neither authority approved those reports.

¶ 134 I will now deal with the liability of the defendant geotechnical engineers.

¶ 135 With respect to this issue I heard evidence from geotechnical engineer Gordon McRostie on behalf of the plaintiff an Dr. Guy Lefebvre called on behalf of the defendants Jacques Whitford Limited and John D. Paterson and Associates Ltd.

¶ 136 Mr. McRostie received his engineering degree from the University of Toronto (Honours) in 1944 and has practised actively as an engineer since that time. His field of expertise has been in geotechnical engineering and he has had a particular interest in retrogressive landslides during the entire course of his career.

¶ 137 In all, Mr. McRostie has visited the plaintiff's property on three occasions. He was initially retained by the plaintiff's solicitors to make a geotechnical study and determine firstly whether the present theatre restaurant building on the property was safe and secondly if not safe, to determine what remedial work was required to make it safe.

¶ 138 Both in his viva voce evidence and in his report dated January 9, 1997 at Tab 129 of Exhibit 4, Mr. McRostie indicated the following.

¶ 139 In preparing his report he reviewed the Golder Report of November 1988, the Paterson Report of November 22, 1990 and the Jacques Whitford Report of October 31, 1990. He reviewed the published papers on the South Nation River, retrogressive landslides and several other technical papers as listed on pages 4 and 5 of his report. He spoke with Morey and reviewed with him his reports to the Authority. As well he spoke with Professor R. Mitchell at Queens University who is the originator of the model of estimating retrogression distance.

¶ 140 With that background, McRostie visited the site on January 6, 1997 and conducted a detailed site inspection through a distance .8 kilometers upstream and downstream of the site. He made the following observations:

(a) the most critical slope for the theatre restaurant building is on the adjacent neighbour's land to the east. This was the most critical slope because it is the part of the riverbank closest to the building and because it has a steeper slope than that located on the plaintiff's property;
(b) a small landslide scar exists on the west bank of the first gully east of the plaintiff's property indicating continuing instability of the lower riverbank slopes; and
(c) there is evidence of continuing creep type movements in the lower third of the river slopes consisting of bends in the trunks of trees near the ground indicating movements first tilting the trees then the trees returning to vertical as they continue to grow.

¶ 141 After discussions with his associates, McRostie arrived at the following conclusions.

(a) There is a fairly broad based group of opinions in the geotechnical field that the risk of an initial landslide continuing as a retrogressive slide can be estimated. The method of estimation needs to recognize at least four factors namely, stability number, liquidity index, sensitivity and undrained sheer strength.
(b) the Golder/Morey 1988 Report on the plaintiff's site outlines a method which includes a recognition of the above-factors and McRostie is in agreement with that report's conclusion that the site is at risk of having a retrogressive landslide if an initial slide begins.
(c) There is a less general agreement among the experts with

respect to the ability to predict the distance to which an initial slide will continue to retrogress. In this respect McRostie referred to cautions expressed by both Dr. Mitchell and Dr. Lefebvre.

(d) Morey was of the view (as expressed in his viva voce evidence here at trial) that his studies over the past ten years are definitive and that the 1993 Lemieux slide confirmed his model and his calculation methods.

(e) While the distance of retrogression is not capable of a highly accurate prediction, McRostie is of the opinion that Morey's recommendation in his 1988 report of a retrogression distance of 340 meters is a reasonable set back distance to be used at this site.

¶ 142 McRostie in his evidence noted that Morey's retrogression distance of 340 meters was measured from the river edge whereas Mitchell's retrogressive distances are measured from the crest. In McRostie's opinion the two methods are based on different assumptions and result in measurements that may differ by 50 to 100 meters. McRostie noted that Morey's distance of 340 meters was measured perpendicular to the river which results in the shortest distance. It appears that the building was located 170 meters from the river and therefore was within the retrogressive distance. It should be noted that I heard competing evidence with respect to whether Mitchell's retrogressive distances are measured from the river edge or from the crest. I am satisfied on all of the evidence that Mitchell's distance was measured from the crest.

¶ 143 McRostie reached the following conclusions and made the following recommendations.

1. In his opinion the theatre building is not safe at certain times of certain years. An initial landslide which could trigger a retrogressive landslide involving the building is most likely to occur only during the Spring months when rapid snow melt and early rains cause exceptionally high ground water conditions in the slope. Some years are more critical than others when all unfavourable weather factors occur at the same time.
2. There are four possible remedial work programs which could be considered to prevent retrogression of an initial slide back to the building:

(a) excavate a new deep cut off gully between the building and the river on the owner's land and on the neighbour's

(b) To prevent any initial slides at the riverbank construct a large rock filled toe berm on the bottom third of the slope. This would be even more costly than a new cut off gully and would create new environmental problems.

(c) Again, to prevent any initial slides at the riverbank, flatten the entire slope. This would involve even more cost and would result in the loss of the entire sugar bush and is not, in McRostie's view, a reasonable alternative to consider.

(d) Increase the existing slope stability and thus prevent an initial slide by installing a large number of vertical pore pressure lowering drains. This is an experimental method which has been tried at a few locations in eastern Canada and has not had reliable success and therefore cannot be recommended.

¶ 144 McRostie was retained by the plaintiff's solicitors to prepare a further report. His second report is dated December 14, 1998 and is located at Tab 142 of Exhibit 4. The terms of reference for this report were to continue the geotechnical studies reported on January 9, 1997 which continued studies were to include a review of the statements made during the examinations for discovery of Stephen J. Walker (John D. Paterson and Associates Ltd.) and Raymond Hatch (Jacques Whitford Limited) on August 12, 1998. The study was to identify the most critical riverbank slope which could cause an initial landslide, to analyze the stability of this most critical slope, to provide an opinion with respect to the risk of retrogression, to give an opinion on the geotechnical professions' standard of investigation in 1990, and to comment on whether the two 1990 reports by the two geotechnical engineers met those standards.

¶ 145 In preparing this second report McRostie reviewed the Jacques Whitford Report of October 31, 1990 (Tab 72, Exhibit 4), the Jacques Whitford letter to the plaintiff dated November 22, 1990 (Tab 80), the preliminary report of John D. Paterson and Associates Ltd. dated November 19, 1990 (Tab 75) and the full John D. Paterson Report dated November 22, 1990 (Tab 79).

¶ 146 In preparing his second report McRostie was of the view that one of the most important factors to consider in this case was public safety. In my view, it is not possible to disagree with that proposition. McRostie

pointed out that statistics disclosed that there have been about 545 deaths due to landslides in the years between 1840 and 1996 and 98 of these deaths have been due to landslides in the sensitive clays of Eastern Canada. McRostie, in his evidence, expressed the view that in matters such as these the conservative approach is required. I agree with that proposition. Further McRostie expressed the view that acceptance of any safety factor less than 1.5 is not a conservative approach. On all of the evidence I find that to be the case.

¶ 147 In McRostie's view there were two reasons why the plaintiff's property and building posed a special public safety risk. Firstly, the theatre restaurant is a place of public assembly. Secondly, it is attractive to groups of people at the time of the Spring snow melt conditions which is the period of highest landslide risk since ground water levels are often at their highest points of the entire year during the early Spring months.

¶ 148 To identify the most critical riverbank slope in connection with the theatre building, McRostie examined the riverbank slopes across the full width of the plaintiff's property and also for about 1,000 meters both upstream and downstream. In his view, the most critical slope that could effect the plaintiff's property is almost directly opposite the theatre building on a line drawn at right angles to the riverbank and extending through the neighbour's property to the east. The shortest distance from the riverbank to the theatre building is approximately 170 meters. McRostie, in his evidence, noted that the Paterson Report in section 1.0 states that "The site is located approximately 340 meters from the crest of the slope" and that the Jacques Whitford Report states in section 6.1 that "The stability condition of the Nation River located approximately 350 meters north of the proposed restaurant is not of concern". In McRostie's view it appeared that both these reports misunderstood the principles involved in identifying the most critical slope. McRostie further noted that in this case the closest spot to the river and the critical slope happened to coincide and that if a retrogressive landslide occurred at this point it would certainly involve the plaintiff's building.

¶ 149 At pages 6 and 7 of McRostie's report dated December 14, 1998 there is analysis of the most critical slope which indicates the following.

¶ 150 In analyzing the stability of riverbank slopes to consider whether an initial slide is likely, which in turn could retrogress and effect a site considerably further from the river, there are two groups of assumptions that must be made. The first is the soil strength parameters and the second is the ground water levels and ground water flow conditions. Soil strength parameters recommended in a broadly based study by Poschmann et al published in 1983 have been consistently used in all of the studies made to date including McRostie's studies.

¶ 151 Assumptions of the applicable ground water conditions are more variable and more complex since they vary with the season and the years. The Paterson studies of 1990 made the conservative assumption of a fully saturated slope with horizontal flow of water (RU = 0.6). Using those assumptions, Paterson calculated a factor of safety of about 1.4 for the slope on the plaintiff's property which is the slope that Paterson chose to analyze. McRostie notes that if Paterson had identified the slope which McRostie feels is the most critical, and used those same assumptions, Paterson would have calculated a factor of safety of 1.09 which would have been, in McRostie's opinion, a totally unacceptable factor of safety.

¶ 152 In calculating his factor of safety McRostie assumed a situation where maximum flood levels had been caused on the South Nation River by the combination of ice jams in the river, Spring snow melt, and Spring rain. McRostie explained that in these circumstances when the ice jam breaks the flood level drops dramatically in a few hours creating a "rapid draw down" condition in the lower portion of the critical slope. To recognize this phenomenon McRostie was of the view that one should assume a horizontal ground water flow in the lowest 8 meters of the slope. With these assumptions, McRostie's calculated factor of safety for the critical slope is 1.19 which again is unacceptable.

¶ 153 As McRostie points out in his report, an even less conservative assumption would be to neglect the ice jam and rapid draw down scenario and assume ground water flow parallel to the slope for its full height. According to McRostie's calculations the resulting factor of safety using these assumptions is 1.24 which is still unacceptable.

¶ 154 With respect to the question whether or not the initial riverbank failure would retrogress, McRostie is of the view that this is best answered by air photos which, in his view, any competent engineer would review in studies such as these. McRostie, in his evidence, pointed to Exhibit 2, the site air photo, which was contained in Morey's site specific report to the plaintiff dated November 1988. McRostie identified in the immediate vicinity of the plaintiff's property three landslide scars which in his view present a very serious warning with respect to the potential for a retrogressive landslide. Two of the landslide scars are on the far side of the river across from the plaintiff's property. A third scar is on the plaintiff's side of the river located a short distance to the west of the plaintiff's

property. Morey, in his evidence, also identified these retrogressive landslide scars. McRostie pointed out that the biggest scar of the three, that is the one directly across the river from the plaintiff's property, is large enough that it would, if it occurred on the plaintiff's side of the river, take in all of the plaintiff's property north of the gully.

¶ 155 Based on information available from the Authority it appears that at least one of the three retrogressive landslides occurred within human memory (a few hundred years). In McRostie's view, if there is no evidence to the contrary, then for the purposes of studies such as these, one should assume that the slides occurred in recent times. I agree with that proposition.

¶ 156 From all of the foregoing McRostie concluded that there was in 1990 an unacceptable risk of the occurrence of an initial slide at the riverbank below the plaintiff's property and that an initial riverbank slide at that location should be expected to retrogress some hundreds of meters back from the original slope crest which would endanger the plaintiff's property.

¶ 157 It should be noted that while he did not give evidence at this trial, there was reference during the course of other evidence to a theory proposed by Dr. Daniel Lagarec that initial slope failures would not retrogress into parts of the flat upper lands that are covered by trees. McRostie commented that Dr. Lagarec's theory is not generally accepted by geotechnical engineers. McRostie explained that he has studied air photos of several retrogressive landslides and observed masses of trees in the slide debris indicating that treed zones had been included in the failed areas. Interestingly, there is a record in the Quebec Gazette, April 6, 1840, reporting a landslide on the Maskinonge River where workers in a sugar bush had to flee to escape a retrogressive landslide which advanced through the sugar bush despite the presence of many trees. It is of interest to note as well that Professor Lefebvre has, independent of this particular case, expressed the opinion that even dense tree growth has not been and could not be expected to retard or stop the progression of a retrogressive landslide into adjacent upper levels.

¶ 158 With respect to the distance of retrogression, McRostie maintains the opinion expressed in his initial report and that is that while the distance of retrogression is not capable of highly accurate prediction, the Morey recommendation in his November 1988 report to the plaintiff of a retrogression distance of 340 meters, is a reasonable set back distance to be used at this site. There is no doubt in McRostie's mind that the retrogression distance at the site would be greatly in excess of the 170 meter distance which separates the theatre building from the riverbank. He concludes, therefore, that at certain times of certain years the restaurant theatre building is at risk of being destroyed by a retrogressive landslide.

¶ 159 In addressing the standards of the profession in 1990, McRostie in his report and in his viva voce evidence expresses the view that a geotechnical investigation into the possibility of a landslide affecting a building site adjacent to a riverbank slope would have, in 1990, contained the following activities.

1. Review of existing air photos for one or more kilometers upstream and downstream from the site to determine past landslide areas.
2. Review of any published reports on landslides in the area.
3. Review of any site specific landslide risk reports for the site being studied or for sites less than a kilometer away on the riverbank.
4. Personal inspection of the site and the adjacent riverbank slopes for a least 500 meters upstream and downstream to establish the most critical slope location with particular attention to be paid to the slope at the zone closest to the subject site measured at right angles to the riverbank.
5. A review of the possible consequences of a landslide failure, a consideration of whether the landslide would effect buildings or just occupy land and a consideration of whether the building might have special uses making the building more critical to the safety of occupants.
6. Items 4 and 5 would be made by a geotechnical engineer with experience in landslide studies since judgment of the critical slope, its most likely inclinations, possible seasonal ground water fluctuations, the consequences of an initial slope failure and the risk of a retrogressive failure, are all aspects requiring engineering judgment and could not be expected from a technician.
7. The risk of an initial or trigger slide developing into a retrogressive landslide would require special study.
8. That study would include a visual estimate of the steepness of all slopes close to the site, any slopes with an inclination steeper than about 15 degrees and a height more than 10 meters would be surveyed using a clinometer and tape or survey level and tape. Evidence of Spring flood levels would be examined and recorded. The calculated factor of safety for the most critical slopes would then be obtained for a range of possible ground

water flow assumptions and a set of reasonable soil property assumptions. A desirable factor of safety resulting from these calculations would then be judged with a suitable margin of safety included which would recognize the limitations of the analysis methods and assumptions plus the consequence of a failure.

9. If the critical riverbank slopes were judged not to have an adequate margin of safety, then the next two considerations to be studied would be the risk of retrogression and possible retrogression distance. The main evidence to be considered here would be evidence of past landslides shown by past failure scars on air photos.
10. After reaching a conclusion that a critical initial riverbank slide is possible and also that retrogression is possible, then a study of retrogression distance is required.

¶ 160 Having regard to what he saw to be a reasonable standard of care to be expected of a geotechnical engineer in circumstances such as these, McRostie in critiquing the Paterson Report, made the following observations.

1. The Paterson Report does not appear to recognize or consider the evidence of past retrogressive slides in the areas which slides can be seen in the available air photos. It was his understanding that the Morey site specific report dated November 1988 was made available to Walker and it contains an air photo clearly showing past retrogressive landslide scars in the immediate area of the plaintiff's property.
2. The Paterson Report does not appear to recognize and consider the site specific information in the same Morey Report which shows in Figure 3 an existing riverbank slope with an estimated factor of safety below 1.5 and likely close to 1.0.
3. The Paterson Report was not based on site inspections by an experienced geotechnical engineer.
4. The Paterson Report does not appear to have considered the public safety risks having regard to the use to which the plaintiff's building was being put.
5. The Paterson Report does not appear to have selected the appropriate most critical riverbank slope.
6. The Paterson Report concluded that the restaurant theatre site was not at risk from a retrogressive slide chiefly due to the fact that it failed to select the appropriate most

¶ 161 In critiquing the Jacques Whitford Report, McRostie in his evidence expresses the following views.

1. The Jacques Whitford Report does not appear to recognize or consider the evidence of past retrogressive landslides as seen in the air photos.
2. The Jacques Whitford Report does not appear to have considered the public safety risks.
3. The Jacques Whitford Report and later studies do not appear to have been based on an adequate on site examination of the possible most critical slopes. Examination of riverbank slopes only along the riverfront of the plaintiff's property together with visual examination "as far as the eye could see" through a wooded zone does not meet these standards outlined in McRostie's evidence.
4. The Jacques Whitford Report does not appear to have been based on a thorough study of whether an initial slide could retrogress. There appears to have been an unquestioning reliance on the theory presented by Dr. Lagarec that because the subject land was heavily wooded, retrogression of an initial slide would not occur.
5. The Jacques Whitford Report does not appear to have determined a retrogression distance however the report does state that the theatre restaurant site is located approximately 340 meters north of the Nation River. McRostie notes that in Jacques Whitford's letter to the plaintiff dated November 22, 1990, this distance is corrected to some 200 meters north of the river. The letter also comments that the possibility of a retrogressive failure at the critical slope east of the plaintiff's property has not been investigated. McRostie expresses the view that the end result of the November 22, 1990 letter would be to give moderate encouragement to proceed with building at the site. In McRostie's view Jacques Whitford presented the risks as being indefinite and low when in fact the risks were and still are, very real and possibly catastrophic.

¶ 162 McRostie's examination-in-chief was followed by a detailed cross-examination by the defendant engineers' counsel, Mr. Rasmussen. During the course of this cross-examination it was clear that there can be a significant variation in factor of safety calculations depending on the assumptions upon which the calculations are made and perhaps more particularly depending on the Ns number being incorporated in the formula. As well, it was conceded during the course of cross-examination that the factor of safety calculation will depend on the soil strength parameters assumed and on the assumed ground water conditions. While McRostie conceded in cross-examination that in all of the calculations that he did, he did not take into account any underflow drainage. McRostie explained that underflow drainage was not taken into account because there was a possibility that during Spring floods under drainage would be overcome by temporary higher ground water. He conceded to Mr. Rasmussen that it was the pore pressure in the lower areas of the slope that was most critical and that if in fact there was continuous underflow drainage, then the factor of safety calculation would reveal a higher number.

¶ 163 As well during the course of cross-examination Mr. Rasmussen and McRostie discussed the fact that vane sheer strength measurements which go into the formula for determining the factor of safety can be determined both by instrument in the field and also by calculations in the laboratory with samples that have been taken in shelby tubes. McRostie did not agree that one could get two totally different results in this type of soil material depending on which method was used.

¶ 164 McRostie readily conceded to Mr. Rasmussen that in his view for there to be a real risk of a retrogressive landslide engulfing the subject building three factors were needed.

1. Spring snow melt.
2. Spring rain.
3. Rapid draw down in the river level as a result of an ice dam breaking.

He conceded as well that if one could eliminate the effects of these factors then in his view the building site is not at risk provided preventative works were undertaken at the riverbank to make sure that the riverbank did not change. McRostie conceded to Mr. Rasmussen that over the last 10,000 years since the withdrawal of the glaciers it is likely that the three critical factors have occurred simultaneously and that there has not been a retrogressive landslide that has engulfed this particular site but certainly one that has engulfed the site across the river. In answer to the question why the plaintiff's site did not fail at the same time as the site across the river if those conditions existed simultaneously, McRostie explained that the nature of the snow accumulation on each site can be different and as well the nature of the vegetation can be different thus affecting the infiltration rate.

¶ 165 During the course of cross-examination there was filed as Exhibit 15 a page of notes from McRostie's file in his own handwriting. His note is to the effect that Whitford's letter of November 22nd constitutes a retraction of their approval of the building location north of the gully and that Paull Leamen (counsel for the plaintiff) will have to settle the question whether this lets the defendant Jacques Whitford off their responsibility for their opposite opinion in their October 31, 1990 report. McRostie would not concede that he in fact felt that the November 22nd letter was a retraction of Jacques Whitford's approval but rather only a weakening of their opinion in that respect.

¶ 166 Throughout all of the cross-examination McRostie remained an impressive and credible witness and was not significantly shaken on his evidence given in examination-in-chief.

¶ 167 Dr. Lefebvre who was called on behalf of the defendant engineers received his Civil Engineering Degree in 1965 at the University of Laval and his Masters Degree in Geotechnical Engineering at the same University in 1968. He received his PhD in Geotechnical Engineering at the University of Laval in 1970. He has done field work in the field of geotechnical engineering on a consulting basis. He has, however, been primarily a professor doing teaching and research at the University of Sherbrooke, Civil Engineering Department, since 1972. He candidly admitted that he, unlike McRostie, Paterson or Jacques Whitford, does not deal on a usual basis with everyday problems in the field of geotechnical engineering.

¶ 168 With respect to the qualifications of Dr. Lefebvre to give evidence as to whether or not Paterson or Jacques Whitford met the standards of the profession in preparing their reports, Mr. Leamen for the plaintiff argued that Dr. Lefebvre did not have enough practical experience to render such an opinion. I ruled that the doctor was qualified to give me his opinions with respect to the adequacy of the defendants' reports and thereafter it would be a question of what weight I might give to Dr. Lefebvre's evidence in that respect.

¶ 169 Dr. Lefebvre was retained by Mr. Rasmussen on behalf of the defendant engineers in 1999 to assess the situation. In preparation Dr.

Lefebvre reviewed the documentation and visited the site in November of 1999 for approximately three hours. He looked at the ravine adjacent to the building. He walked to the river from the top of the property through the terrace and to the bottom of the slope observing some erosion at the toe of the slope.

¶ 170 At Tab 9 of Exhibit 25 is Dr. Lefebvre's report dated February 2000. It is of interest to note that beginning at page 17 of his report Dr. Lefebvre acknowledges that the purpose of the report is not to fill the role of another geotechnical engineer who would conclude on the risk of landslide and the necessary set back at the Lamadeleine property. Rather he states in his report that the purpose is to examine if the work, conclusions and opinions delivered by Jacques Whitford Limited and John D. Paterson in response to their respective mandates were adequate and were as expected from a reasonably competent engineer. Notwithstanding the stated purpose of his report, it seems clear on a reading of his report and considering his viva voce evidence that Dr. Lefebvre is supportive of the proposition that the subject property is not at risk for a retrogressive landslide.

¶ 171 In his report, under the heading Evaluation of a Safe Set Back Distance, the doctor notes that a slope or riverbank must first be effected by a landslide before this first landslide could retrogress inland at a certain distance from the riverbank. He points out that two aspects thus need to be examined to evaluate if a site could be affected by landslide retrogression; first the state of stability of the riverbank and second the possibility of retrogression if the riverbank is effected by a landslide.

¶ 172 The doctor, in his evidence, pointed out that the factor of safety of a particular slope depends on a number of parameters including the pore pressure of the water in the clay. The doctor explained the factor of under drainage. When the river valley reaches equilibrium and reaches the glacial till then the clay above drains into the till and the pore water pressure becomes much less and conversely the slope much more stable. The doctor pointed out that Morey in his September 1988 regional study installed piezometers on the west side of the plaintiff's property which indicated strong under drainage. According to Dr. Lefebvre, the measurements indicated no water pressure at the bottom and if there was almost no pore water pressure then the slope would be much more stable. He went on to explain that in calculating the factor of safety if one does not take into account underflow drainage, then the factor of safety calculation is too low. As well the doctor noted that at the plaintiff's site there was a terrace which protects the slope. He observed some erosion at the toe of the slope but explained that the terrace tended to protect the toe of the slope in that there is room for erosion to occur. He observed that the terrace gets wider as it extends to the west of the property. It should be pointed out that counsel for the plaintiff quite properly complained that none of this evidence was in the doctor's report and that as a result the Rules were not being complied with. I decided to hear the evidence and to provide Mr. Leamen with any additional time he required to consider it.

¶ 173 Dr. Lefebvre went on in his evidence to express the opinion that the important under drainage identified at the riverbank on the plaintiff's property has a significant impact in the evaluation of slope stability and was critical of both McRostie and Morey in that they had completely neglected the under drainage in their slope stability analysis.

¶ 174 In his report the doctor notes that for a retrogression to develop, the soil involved in a first slope failure must be sensitive so that its strength after failure would be low enough for the slide debris to flow out of the crater instead of acting as a stabilizing berm at the toe of the backscarp (the wall of soil left at the back after a slide). In his report he goes on to explain that once the backscarp is left exposed its stability is controlled by the stability number Ns which is the ratio of the weight of soil column in the backscarp over the undrained sheer strength of the soil at the base of the soil column. According to Dr. Lefebvre, Mitchell has demonstrated that the stability number needs to be at least six for the development of plasticity and earth flow whereas failure of the vertical backscarp may develop when the stability number exceeds four but the height of the backscarp rapidly decreases with this type of phenomena leading to a limited retrogression distance. Dr. Lefebvre pointed out that one observes a general increase in the stability numbers as one goes downstream from the subject property with the increased stability numbers reflecting a greater chance for a retrogressive slide.

¶ 175 Dr. Lefebvre in his evidence was again critical of Morey and McRostie in that as far as he was concerned they had assumed critical pore water pressure in doing their calculations and had not taken into consideration the under drainage. As well the doctor was critical of what he referred to as McRostie's "theory" relating to an ice dam, a sudden rising of the river level, and a failure of the ice dam and a quick draw down. It was the doctor's view that a rapid draw down can be critical if the water has been dammed up for three or four months because by that time the slope will have obtained equilibrium. However, in the doctor's view if the situation lasts for only a few days, perhaps five or six, then the slope has not

reached equilibrium with the river and when the dam breaks, it has very little effect.

¶ 176 Beginning at page 25 of his report Dr. Lefebvre addressed the Paterson Report. The doctor noted that in its slope stability analysis Paterson used a very conservative condition for the ground water with a water table at surface and horizontal flow (ru = 0.6). Paterson evaluated a factor of safety of 1.4 which the doctor noted was identical to the overall factor of safety of 1.4 evaluated by Morey in his November 1988 report. Dr. Lefebvre comments, however, that the Paterson Report added an important statement to the effect "This analysis was conducted using excessively high pore water pressure conditions that are likely never to develop in the slope". Dr. Lefebvre in his report comments that this statement is correct and more so considering the strong under drainage of the riverbanks existing at this site.

¶ 177 Dr. Lefebvre in his report points out that the Paterson Report concluded that should a failure of the riverbank occur, it would not retrogress back to the location of the proposed building. Dr. Lefebvre quite correctly points out that the Paterson Report does not contain any details to support that conclusion and notes further that the Ns values evaluated in the 1988 borings would yield a maximum distance of retrogression of at the most 180 meters which corresponds with the true distance of the Lamadeleine building from the river.

¶ 178 Finally in his report Dr. Lefebvre expresses the opinion, based on all of the available information, that the conclusions of the Paterson Report conform to the state of the art and was as would be expected from a reasonably competent engineer faced with the same mandate.

¶ 179 Beginning at page 26 of his report Dr. Lefebvre deals with the Jacques Whitford Report. He begins by stating that in his view the November 22, 1990 letter from Jacques Whitford constitutes a very strong reserve about the stability of the site. He does concede, however, that while it is clear from the declaration of scope of work described in its October 31st report, that Jacques Whitford had understood its mandate as concerning essentially the bearing capacity at the proposed building site and the slope stability at the adjacent ravine, nonetheless the Jacques Whitford Report did state that "It is not expected that instability of the riverbank will jeopardize the proposed building at the location investigated". Again the report does not detail the basis for that comment.

¶ 180 In the final analysis Dr. Lefebvre was of the view that the Jacques Whitford comments on slope stability and distance of retrogression were correct and conform to state of the art analysis. In his view the careful wording and the strong reservation reflected the fact that Jacques Whitford's work to fulfill its mandate had not been directed toward the stability assessment of the South Nation riverbank and that "This is what any reasonably competent engineer would have done if put in the same position".

¶ 181 During the course of cross-examination there were, what I consider to be, some telling exchanges between counsel for the plaintiff Mr. Leamen and Dr. Lefebvre.

¶ 182 Dr. Lefebvre initially agreed with Mr. Leamen that walking to the east and west of the actual site as he did was at least useful if not necessary. When asked to agree whether any reasonably competent engineer retained to do a slope analysis would do the same thing, the doctor waffled somewhat and said yes and no, explaining that if the building was far enough from the river there was no necessity to walk the site.

¶ 183 The doctor agreed that at the time Paterson and Jacques Whitford did their reports, it was unclear how far the building was from the river and that the information that they had from the Lamadeleine drawing in the Golder Report was not accurate. Dr. Lefebvre initially indicated to Mr. Leamen that if it was in his mandate to do so, then a reasonably competent engineer would be expected to determine for himself the distance from the building to the river for the purpose of analyzing the slope. The doctor then backtracked to some extent. He declined to admit that it was not clear what the distance was when the defendant engineers did their reports. He said that they felt they had the correct distance from the Lamadeleine drawing in the Golder Report and in fact the distance was not correct. He added that the defendant engineer should not be expected to determine the distance if its already set out in a pre-existing report.

¶ 184 When asked whether he agreed that the South Nation River between Casselman and Lemieux was an area prone to retroactive landslides, Dr. Lefebvre responded that in his view only the downstream portion was prone to retroactive landslides. He gave this evidence notwithstanding the knowledge that there exist the scars of three retrogressive landslides in close proximity to the plaintiff's property which is in the upstream portion.

¶ 185 Dr. Lefebvre conceded to Mr. Leamen that the most critical time for a retrogressive landslide to develop on the river is in the springtime which would be at the same time that the theatre restaurant was getting maximum use. Dr. Lefebvre initially conceded that a reasonably competent engineer would be expected to exercise more care in those circumstances and he conceded that when human life is at stake, then a reasonably competent engineer would be expected to take more care. The doctor then retreated from that proposition and testified that if he had known the use of the building, he would expect the engineer to use only normal care.

¶ 186 Dr. Lefebvre conceded that the steepness of the slope is a factor in determining the possibility of failure.

¶ 187 Dr. Lefebvre conceded that Jacques Whitford did no slope stability analysis at all. He was asked whether a reasonably competent engineer asked to comment on slope stability would be expected to do some analysis and he responded that Jacques Whitford did not consider it part of its mandate. Mr. Leamen pointed out to Dr. Lefebvre the following comment in the Jacques Whitford Report.

> The stability condition of the Nation River located approximately 350 meters north of the proposed restaurant is not of concern. It is not expected that instability of the riverbank will jeopardize the proposed building at the location investigated.

Mr. Leamen asked Dr. Lefebvre whether a reasonably competent engineer in saying that would be expected to first do a slope analysis. In my view, Dr. Lefebvre avoided the question by responding that Jacques Whitford was saying that the building was far enough away from the river that the stability of the slope did not matter although he conceded to Mr. Leamen that the building was not 350 meters away as stated in the report but rather half that distance, 180 meters. The doctor was asked whether considering the true distance of the building from the river Jacques Whitford should have done a slope analysis. Dr. Lefebvre responded in the negative saying that that would not be necessary if Jacques Whitford was convinced on the wrong evidence. The doctor did concede that if Jacques Whitford knew that the information that it had from the Lamadeleine map was wrong, then Jacques Whitford would be at fault. Mr. Leamen referred Dr. Lefebvre to the Jacques Whitford letter of November 22nd, the first paragraph of which refers to the South Nation River being located some 200 meters north of the building site. The doctor agreed that it is apparent that at this point Jacques Whitford knew that the 350 meter distance was wrong. Mr. Leamen suggested to Dr. Lefebvre that the real distance being 180 meters, Jacques Whitford got it wrong for the second time and asked Dr. Lefebvre whether that would be consistent with the responsibilities of a reasonably competent engineer. Dr. Lefebvre essentially provided the same stock answer, that is, that the Lamadeleine drawing in the Morey Report was at fault. The doctor did concede, however, that the 1156 foot distance indicated on the Lamadeleine map was obviously not the shortest distance to the river and anyone looking at the map would realize that fact. The doctor conceded that this was not the way to express the distance to the river (through the length of the lot parallel to the lot line) and that any reasonably competent engineer would know that.

¶ 188 Mr. Leamen referred Dr. Lefebvre to Jacques Whitford's letter of November 22, 1990 and particularly the third paragraph thereof which reads in part as follows:

> We noted that the riverbank conditions immediately east (upstream) of the site is rather different. The possibility of a retrogressive failure at that site has not been investigated. A failure upstream could possibly jeopardize a portion of the present site. However it is also noted that a ravine is present between the proposed restaurant and the east property line. A ravine such as the existing one may act as a potential barrier of retrogressive failure. (underlining mine)

Dr. Lefebvre conceded to Mr. Leamen that he observed no gully that would protect the building from a retrogressive slide and in particular there was no ravine on the plaintiff's property or near by that would protect the building from a retrogressive landslide, contrary to the suggestion in the Jacques Whitford letter.

¶ 189 With respect to Paterson's involvement, Dr. Lefebvre really had no explanation as to why Paterson drilled its bore hole at the building location as opposed to a point closer to the slope. Nor could the doctor explain what the purpose of the bore hole was if there was no analysis of the bore hole results. Dr. Lefebvre conceded that he could not tell from the Paterson Report how Paterson had evaluated the retrogressive distance however he did not agree with Mr. Leamen's suggestion, as supported by the evidence of McRostie that if Paterson had done the same analysis that McRostie did, the retrogressive distance would have been calculated at 380 meters.

¶ 190 With respect to the three retrogressive landslide scars in the immediate vicinity of the plaintiff's land, Dr. Lefebvre in discussing with

Mr. Leamen the Mitchell Formula, conceded that the existence of those slides could be relevant information because they could lead one to the conclusion that the clay there is susceptible to failure and accordingly the retrogressive distance would have to be determined.

¶ 191 Mr. Leamen closed his cross-examination by putting this question to Lefebvre:

> If the land is unsafe could one or two reasonably competent engineers have done their work competently by saying that it is safe?

Dr. Lefebvre answered that if the land is clearly unsafe and the engineer unequivocally says that it is safe, then he is incompetent. In re-examination Mr. Rasmussen asked Dr. Lefebvre whether two competent engineers could arrive at different conclusions. His response was in the affirmative. He pointed out that if the study had been done downstream then probably all three consultants, Morey, Paterson and Jacques Whitford, would reach the same conclusion. However, if the risk is very small, there may be a degree of conservatism resulting in different opinions.

¶ 192 In his evidence McRostie critiqued Dr. Lefebvre's written report and made the following comments.

1. Dr. Lefebvre in his report refers to the distance from the building to the river given by the client of 1128 feet. McRostie notes that as a general principle engineers do not accept anyone else's measurements of location.
2. While Dr. Lefebvre is an eminently qualified engineer he makes no mention of certain facts such as

   (a) neither Paterson or Jacques Whitford made use of air photos which was a glaring omission;
   (b) he states that the Paterson Report contains no plan and that Paterson had no evidence as to where the building was to be. This was not so. If one looks at the Paterson Report at Tab 79, Exhibit 4, on the last page there is a plot plan setting out the location of the proposed building. The plan itself is erroneous. It notes the scale to be 1 to 1000 whereas it should be 1 to 3000. It appears that Paterson took the plan and redrew it and in doing so made an error with respect to the scale. As well it appears that the gully was drawn in an incorrect location on the plan.

3. Dr. Lefebvre's comments with respect to the difference in retrogressive distances was made with the lack of awareness that Mitchell's distances were from the crest and Morey's from the shore.
4. Dr. Lefebvre made no comment on Paterson's and Jacques Whitford's lack of concern for public safety.
5. McRostie explained that as, over the course of the centuries, the river erodes its course through the clay, it eventually gets to a level such that the pore pressure in the river bank runs down, rather than out, leaving the slope more stable. Acknowledging Dr. Lefebvre's outstanding work in the field of downward pore pressure, McRostie was of the view that this is not a factor in this case when one looks at past recent slides which occurred when the riverbed was at the same depth as it is now. McRostie was of the view that with respect to these most recent slides the run off must have over powered the downward flow.

¶ 193 To the extent that McRostie and Lefebvre differ in their views as to whether the subject building is "safe" from a retrogressive landslide, I have no hesitation in accepting the evidence of McRostie. It would appear that McRostie is the dean of geotechnical engineers in the Ottawa area. He has been practicing in the field since 1944 and has been involved in projects relating to retrogressive landslides since at least 1955. In my view he was impartial in formulating his opinions on sound engineering principles. Indeed it would have been in his client's Lamadeleine's best interest at the time of his first report dated January 9, 1997 prior to the OMB hearing, if McRostie had not found that in his opinion the subject building was not safe at certain times of certain years bearing in mind that Lamadeleine at the OMB hearing was opposing the appeal of the Authority relating to the by-law which, by that time, had excluded the subject property from the hazard zone. I found McRostie's evidence to be even-handed. His approach was sufficiently conservative to take into account the possibly catastrophic results of a retrogressive landslide engulfing the theatre restaurant building during the Spring of the year. From a realistic and practical point of view I find it difficult to understand, notwithstanding the different technical results that might be obtained by using different assumptions in the calculations, how anyone can seriously argue with the opinions of Morey and McRostie that absent appropriate remedial work it was not safe to construct the building to the north of the east west ravine and that in doing so, it was placed at risk of being engulfed by a retrogressive landslide. Although such a retrogressive landslide would only occur in the very peculiar

circumstances and indeed might never occur, the result would be so catastrophic that the risk is unacceptable.

¶ 194 With respect to the competing evidence on the question whether the defendant engineers met the standard of care expected of them in conducting their investigations and preparing their reports, McRostie is very much a "field man" with vast experience as a geotechnical engineer in the field since 1944. He continues in active practice to this date. Dr. Lefebvre candidly admitted that unlike McRostie, he does not deal on a usual basis with every day problems. In my view, McRostie is in a much better position than Dr. Lefebvre to offer guidance to the court as to what would have been expected of a consulting geotechnical engineer in 1990 in the circumstances of this case and as to the applicable standard of care expected of a geotechnical engineer at that time. I am comfortable in accepting McRostie's evidence with respect to that standard of care and I am equally comfortable in accepting his evidence as to the manner in which the defendant geotechnical engineers failed to meet that standard.

¶ 195 As is pointed out in Linden, Canadian Tort Law, (Third Edition) at page 130:

> ... An accurate explanation of the standard of care expected of a professional person has been articulated as follows:
>
> > "[The] degree of skill consistent with the function discharged, that is, consistent with the measure of skill displayed by others reasonably competent in that profession touching matters of like kind. Perfection is not expected; the world of work, not the ideal of the debating area, is the standard." (See Trident Construction v. W.L. Wardrop and Associates Limited [1979] 6 W.W.R. 481 at page 533 (Man.Q.B.) (per Wilson J.) speaking of an engineer.)

¶ 196 As well, if an engineer holds himself out to be an expert or a specialist in a specific area, there is a requirement on his part to exercise the degree of skill expected of a specialist, rather than the degree of skill of an ordinary engineer. As was said by Abbott J. in Wilson v. Swanson (1956) 5 D.L.R. (2d) 113 (S.C.C.) at page 7 in a case involving medical malpractice:

> The test of reasonable care applies in medical malpractice cases as in other cases of alleged negligence. As has been said in the United States, the medical man must possess and use, that reasonable degree of learning and skill ordinarily possessed by practitioners in similar communities in similar cases, and it is the duty of a specialist such as appellant, who holds himself out as possessing special skill and knowledge, to have and exercise the degree of skill of an average specialist in his field.

¶ 197 While recognizing that there may be a legitimate difference in approach taken by different geotechnical engineers and a legitimate difference in opinion among them as to the safety of any given site without there necessarily being negligence on the part of one or more of those geotechnical engineers, I am satisfied on the evidence in this case that there was negligence on the part of each of the defendants Jacques Whitford Limited and John D. Paterson and Associates Ltd. in that, in the circumstances of this case, they failed to live up to the ordinary and reasonable standard of care to be expected of a geotechnical engineer.

¶ 198 With respect to the negligence of the defendant Paterson, I find the following.

¶ 199 In its letter dated November 19, 1990 to Lamadeleine, Paterson was negligent in stating that "The structure is located greater than 340 meters from the crest of the South Nation River". In fact the shortest distance from the building to the river was 170 meters. Paterson was negligent in relying on the distance indicated on the Lamadeleine map particularly in view of the fact that this distance was taken parallel to the east and west boundary lines of the property, a distance which had no geotechnical significance. Paterson was negligent in failing to satisfy itself as to the shortest distance from the building to the river. It follows that Paterson was negligent in stating in its preliminary report that "however, our calculations indicate that the proposed structure is set back a distance that is more than adequate to buffer the structure against a possible slope failure, should it occur." In assuming a set back distance of 340 meters Paterson was overstating the actual set back distance by 100%.

¶ 200 In its report dated November 22, 1990 signed by geotechnical engineer Walker, Paterson said the following "We have reviewed the Golder Associates Report #881-2486 and agree that there is always the possibility of landslides occurring along the South Nation River; however, after examining the site conditions (i.e. gullies, slopes, etc.) and the lands being forested and well drained, it is our opinion that the proposed building is sufficiently set back from the river so that should a failure occur, the building would not be adversely affected". The inclusion of this comment was obviously an attempt by Paterson to accommodate Lamadeleine's

request that the "Lagare paragraph" (Tab 77, Exhibit 4) be incorporated in its report.

¶ 201 Paterson was negligent in representing to Lamadeleine that a qualified geotechnical engineer had examined the site conditions when in fact no such examination had been done by a geotechnical engineer. Paterson was negligent in all of the circumstances of this case in not having a qualified geotechnical engineer examine the site prior to delivery of its report.

¶ 202 Paterson was negligent in failing to identify the most critical slope running to the east of the subject property and in failing to calculate the factor of safety for the most critical slope.

¶ 203 Having calculated a factor of safety of 1.4 for the slope that it did analyze and having conceded in its report that this factor of safety represented only a marginally stable slope condition, Paterson was negligent in expressing the opinion that should a failure of the bank occur, it would not retrogress back to the location of the proposed building without having first calculated a retrogression distance.

¶ 204 Paterson was negligent in failing to inspect the riverbank a reasonable distance in both directions from the plaintiff's property. Such an inspection might well have brought to Paterson's attention the most critical slope located to the east of the property.

¶ 205 Paterson was negligent in failing to consider aerial photographs of the subject area which showed the three distinct retrogressive landslide scars in the immediate area of the plaintiff's property.

¶ 206 Paterson was negligent in failing to take into consideration those historic retrogressive landslides when assessing the potential for initial failure and retrogressive distance.

¶ 207 On all of the evidence Paterson was negligent in failing to give sufficient consideration to the risk to human life before expressing its opinion that "The proposed building is sufficiently set back from the river so that should a failure occur, the building would not be adversely affected".

¶ 208 I may say that in the circumstances of this case while the risk of a retrogressive landslide extending to the subject building was a slight risk only, putting the building in danger at certain times of certain years when the combination of Spring rains, melting snow run off and a sudden dam breaking might all occur at the same time, the result of the risk materializing could be so catastrophic that a conservative approach is required in determining the safety of the building from a geotechnical engineering point of view. Thus, the approach of Morey and McRostie was a reasonable and appropriate one in the circumstances including the assumption of high pore water pressures. Having used those conservative assumptions and having arrived at a factor of safety which is less than the MNR's base line factor of 1.5, then in my view it is negligent of the geotechnical engineer to forego (as did Paterson having found a factor of safety of 1.4) a calculation of retrogressive distance on the basis that the marginal factor of safety was calculated "using excessively high pore water pressure conditions that are likely never to develop in the slope".

¶ 209 I turn now to the negligence of the defendant Jacques Whitford.

¶ 210 In its report to Lamadeleine dated October 31, 1990 Jacques Whitford stated the following in section 6.1 of the report:

> The stability condition of the Nation River located approximately 350 meters north of the proposed restaurant is not of concern. It is not expected that instability of the riverbank will jeopardize the proposed building at the location investigated.

¶ 211 Jacques Whitford was negligent in locating the building at a distance of 350 meters from the river when in fact the shortest distance to the river was 170 meters. Jacques Whitford was negligent in failing to determine on its own the shortest distance from the building to the river and in relying on the 350 meter distance marked on a map which had been given to Kwok at the time of his retainer.

¶ 212 Jacques Whitford was negligent in advising that the stability condition of the Nation River was not of concern and that it was not expected that instability of the riverbank would jeopardize the proposed building when at the time of release of that report Jacques Whitford had made no examination of the riverbank other than to drive or walk the forest road that boundaried the west of the property to the crest of the slope. It is of significance that in the report of October 31, 1990 Jacques Whitford acknowledged that the scope of work for the investigation described in the report did not include a survey of the river slope in order to determine that slope stability conditions.

¶ 213 Jacques Whitford was negligent in providing the opinion as to stability without having made any slope stability assessment at all. As the evidence disclosed, at some point prior to the delivery of the report, Kwok had a telephone discussion with Lamadeleine in which he told Lamadeleine that the report was close to being ready. It was at that point Lamadeleine told him that Kwok had to address the stability conditions of the South Nation River because this was very important to Lamadeleine. It would appear that it was for this reason that Kwok in the report gratuitously commented on the stability of the riverbank.

¶ 214 As well Jacques Whitford was negligent in gratuitously providing an opinion with respect to riverbank stability in its report dated October 31, 1990 without being aware of and without considering the contents of the Golder Report to the Authority and Golder's site specific report to Lamadeleine. Kwok and Hache first became aware of these reports after Lamadeleine received the report of October 31, 1990 and requested Jacques Whitford to include in its report the "Lagarec paragraph", the inclusion of which paragraph Lamadeleine said would "... permit me to obtain a building permit and at the same time allow you plenty of room in your report." According to the evidence of Kwok, he told Lamadeleine that he was not going to change his report but at the same time he was now concerned about retrogression and he advised Lamadeleine that he would look at the Golder Report and write an addendum.

¶ 215 In the Summary of Evidence, Schedule A, I have detailed Kwok's and Hache's further involvement with the subject property and the manner in which their supplementary report dated November 22, 1990 came into existence after the first draft dated November 20, 1990. Kwok, in his evidence, explained that he wanted to address the slope stability portion of his report dated October 31, 1990 because he was not prepared to leave it the way it was in that it was "wide open" and he had not looked at the situation from the point of view of a retrogressive landslide and therefore felt that his report should be qualified.

¶ 216 About a week before November 22, 1990 Kwok and his associate Hache returned to the site. They accessed the property from the forest road on the west side of the property and walked from there east along the bank looking at the terrace and the slope angle and tree cover. It was Kwok's evidence that he believes they walked not very far past the east property line of the subject property. Hache gave no evidence in that respect. In my view, they did not walk a reasonable difference to the east of the subject property and were negligent in failing to do so.

¶ 217 They did not determine the most critical slope in terms of a retrogressive landslide engulfing the subject building, as was determined by McRostie and they were negligent in failing to do so.

¶ 218 Jacques Whitford's letter dated November 22, 1990 reads in part as follows:

> 4. Provided that the existing site conditions are unaltered the risk of a retrogressive failure jeopardizing the proposed restaurant is very low. Retrogressive failure at this site would likely be confined within the mid slope terrace.

Jacques Whitford was negligent in addressing the risk of a retrogressive failure engulfing the building without doing an appropriate slope analysis, without doing a factor of safety calculation, and without doing any calculation of retrogressive distance. I find as a fact that none of these things were done by anyone on behalf of Jacques Whitford.

¶ 219 Further Jacques Whitford was negligent in addressing the risk of a retrogressive failure engulfing the subject building without identifying and analyzing the most critical slope to the east of the plaintiff's property.

¶ 220 In its report dated November 22nd Jacques Whitford was negligent in locating the subject building some 200 meters from the river whereas in actual fact the shortest distance from the building to the river was 170 meters.

¶ 221 While Jacques Whitford in its letter dated November 22nd did acknowledge that a failure of the slope to the east of the subject property "could possibly jeopardize a portion of the present site" and that "the possibility of a retrogressive failure at that site has not been investigated". The letter went on to dilute that caution with the following comment:

> However it is also noted that a ravine is present between the proposed restaurant and the east property line. A ravine such as the existing one may act as a potential barrier of retrogressive failure.

I find as a fact that there is no ravine present between the subject building and the east property line. Dr. Lefebvre testified to that effect and indeed Kwok, in cross-examination, conceded that no such ravine existed. In the

circumstances, Jacques Whitford was negligent in incorporating that caveat in its letter of November 22nd.

¶ 222 Jacques Whitford was negligent in purporting to assess the potential for initial slope failure and retrogressive distance without considering the aerial photographs which clearly showed historic retrogressive landslides in the vicinity of the plaintiff's property.

¶ 223 In his evidence in cross-examination, Kwok took the position that his letter of November 22nd was saying with a strong reservation that it was safe to build on the site. When pressed by Mr. Leamen, Kwok conceded that his opinion at the time and today was and is that to build on the site "is a gamble". On all of the evidence I agree with that opinion. To locate the building to the north of the east west ravine without doing the remedial work recommended by Morey, was to gamble with the lives of the patrons of the restaurant theatre. It was a gamble that was completely unacceptable. In my view, the Jacques Whitford letter of November 22, 1990 does not convey to the reader the fact that construction of the new building on the proposed site would constitute a gamble in terms of the risk of the building being engulfed by a retrogressive landslide. Jacques Whitford was negligent in failing to convey its true opinion that in locating the building on the proposed site, one was gambling with the safety of the building and thus with the safety of the patrons.

¶ 224 In my view it is not practicable to determine the respective degree of negligence as among the defendants. Accordingly, pursuant to section 4 of the Negligence Act, the defendants are deemed to be equally negligent.

¶ 225 I turn now to the question of damages. Negligence, technically, consists of the breach by the defendant of a legal duty owed to the plaintiff to take care, which breach results in damage to the plaintiff.

¶ 226 While I have found the defendants negligent in the sense that their conduct, in my view, falls below the ordinary and reasonable standard of care to be expected of them in the circumstances of this case, there is a very real issue as to whether the plaintiff has suffered any compensable damage as a result of that conduct.

¶ 227 The plaintiff, in its statement of claim, claims damages in the amount of $800,000.00. In paragraph 26 of the statement of claim the plaintiff claims that it has been unable to earn any revenue from the subject building as it would otherwise have done. With respect to this head of damage, it should be noted that the renovation to the existing building on the north side of the ravine was completed in the Spring of 1989 and business was carried on there in 1989 and in 1990. Following the fire in August of 1990 construction of the new restaurant theatre building was completed in January of 1991 and the business operated in the normal course beginning at that time. The plaintiff finally terminated its business activities on the property in August of 1997 and the building has not been used since that time.

¶ 228 At Exhibit 25, Tab 10A, is a document entitled Unaudited Budgeted Financial Statements for the period March 1, 1987 to February 28, 1990 relating to La Sucrerie Casselman Inc. This is a financial record supplied by Lamadeleine at the request of the defendants. The document shows a net loss for each of the three fiscal year ends for a total net loss over the three year period of some $54,000.00.

¶ 229 Beginning at Tab 10B are the financial statements of the business for the fiscal year ends 1991 through to 1997 inclusive. I do not accept Lamadeleine's evidence that the statements do not properly reflect the business operations during those years. I find as a fact that each of the financial statements accurately reflect the operation of the business except for the fact that the expenses shown do not include anything for the time that Lamadeleine would have put into the business. By adding back in depreciation in each of the statements, one can arrive at the real net income or net loss of each of the years of operation as follows:

(a) for the 12 month period ending February 28, 1991, the net income was approximately $7,700.00;
(b) for the year ending February 29, 1992, the net loss was approximately $17,000.00;
(c) for the year ending February 28, 1993, the income was approximately $25,000.00;
(d) for the year ending February 28, 1994, the income was approximately $10,000.00;
(e) for the year ending February 28, 1995, the net loss was $13,000.00;
(f) for the year ending February 28, 1996, the net income was $24,000.00;
(g) for the year ending February 28, 1997, the net loss was approximately $7,600.00;

¶ 230 In 1995 and 1996 the plaintiff leased the restaurant to Rita Benson who had been an employee of the plaintiff in 1992, 1993 and 1994, preparing the restaurant meals in the months of March and April. In 1995

and 1996 Mrs. Benson carried on the same restaurant business but paid rent to the plaintiff and kept the revenues from the meals.

¶ 231 On all of the evidence, I am satisfied that this was not a viable business operation and it is not likely that it would have turned a profit on a regular basis sufficient to reasonably justify the plaintiff continuing with the business. Lamadeleine testified that it was the kind of business that took time to establish. In my view, if after ten years of operation the business was not sufficiently established to turn a regular and significant profit, then it likely would never be so established.

¶ 232 In any event, as will be discussed in some further detail, the plaintiff is not now and has never been prohibited in law from carrying on the theatre restaurant business at the building site.

¶ 233 On all of the evidence, it is not demonstrated that the plaintiff has lost or will lose in the future, any income as a result of the defendants' negligence.

¶ 234 In paragraph 25 of the statement of claim the plaintiff alleges that as a result of the unsafe status of its lands and as a further result of the redesignation of the hazard lands, the restaurant and theatre building have no value and are, in fact, a liability to the extent of the cost of demolition of $25,000.00.

¶ 235 During the course of the trial I heard evidence with respect to the cost to demolish the building, the cost to replace the subject building, the cost of depreciated replacement, the replacement cost of the equipment other than the theatre equipment, and the cost to replace the building as of December 5, 1999. In that respect, the evidence of Ubald Boileau, Norman Lemay, Roland Landry, Sylvain Desjardins and Peter Donnolly, is reviewed in Schedule A. Their evidence is essentially opinion evidence.

¶ 236 On the other hand, there is the direct evidence of Jim Nault as to the cost of constructing and equipping the theatre restaurant building following the fire in the Summer of 1990. Mr. Nault is a property specialist with Cooperators Insurance. In 1990 he was an independent claims adjuster with Renaud Senecal and as such dealt with the plaintiff's fire. The insurance policy on the original building had been issued through Reed Stenhouse and Reed Stenhouse had retained Nault to investigate, assess and settle the fire loss.

¶ 237 The extent of the insurance coverage was $400,000.00 on building, equipment and stock and there was a replacement cost endorsement on the policy if the plaintiff decided to rebuild. The initial payment made by the insurers was for actual cash value and as the plaintiff proceeded to reconstruct the building, it presented invoices to Nault which Nault reviewed and then gave to the insurer with a recommendation for payment. According to the evidence of Nault which I accept in its entirety, the entire limits of the $400,000.00 coverage were eventually paid out. Mr. Nault confirmed in his evidence that everything, including the building and the equipment contained therein, was destroyed by the fire. Even the original concrete slab was condemned and replaced.

¶ 238 Nault was very clear in his evidence that the $400,000.00 policy limits were sufficient to construct the new building and to replace all of the equipment. I find that to be the fact notwithstanding Lamadeleine's evidence, which I do not accept, that additional funds were expended by the plaintiff in the reconstruction.

¶ 239 That being the case, the plaintiff had in 1990, after reconstruction, a building that cost $400,000.00 to construct and to equip. By 1997 when the plaintiff chose to cease business activities, the building and equipment had depreciated significantly.

¶ 240 Except for a few months in late 1996 and early 1997 after the hazard line was redrawn to exclude the plaintiff's property and before the property was put back into the hazard zone by the OMB, the plaintiff's property had been in the hazard zone since its acquisition in 1982.

¶ 241 Lamadeleine, on behalf of the plaintiff company, made the personal choice to discontinue carrying on the business in the face of McRostie's report, in the face of the OMB decision placing the property back in the hazard zone, and, indeed, in the face of the advice being given to him by his solicitor. However, McRostie in his report was not telling Lamadeleine anything that he had not been told by Morey in 1988. The Morey site specific report clearly put Lamadeleine on notice that the existing building on the north side of the east west ravine would not be safe from a retrogressive landslide unless very extensive work was performed along the shoreline. I have found as a fact that Lamadeleine fully understood Morey's caution that the site north of the east west ravine was not safe from a retrogressive landslide unless the remedial work, the extent of which was yet to be determined, was in fact determined and performed. Lamadeleine in the face of Morey's opinion, persevered and managed to get from the Township a building permit to renovate and extend

the existing building to the north of the ravine. Lamadeleine, in doing so, knowingly flew in the face of not only the best expert opinion that he had but indeed the only expert opinion that he had and, that, from a geotechnical engineer that was intimately familiar with the retrogressive landslide problem along the South Nation River.

¶ 242 When the existing building burned down in 1990 Lamadeleine, in order to safe a relatively few dollars on a new septic system, again committed himself to one way or another obtaining a building permit to construct the new building on the north side of the east west ravine without doing the remedial shoreline work required by the Morey Report. Lamadeleine actively encouraged Paterson and Jacques Whitford to write reports which would "get around" Morey's opinion. He even went so far as to suggest the actual language that should be incorporated in their reports.

¶ 243 Lamadeleine suggested in his evidence that prior to the McRostie Report he felt that the building was safe but that now he was not satisfied with the safety of his land and feels that he cannot operate the business again because of the danger to the people. He obviously had no such concerns when he renovated the existing building and started up his business in it in the face of Morey's very clear statement to him of the danger in doing so or when he constructed the new building on the same site.

¶ 244 As well, the plaintiff's property, to the knowledge of Lamadeleine, had always been in a hazard zone since the property was purchased, except for the relatively short time in late 1996 and early 1997 when he had convinced the Township to exclude his property from the hazard zone. The OMB decision then, to redraw the line in early 1997 to put the property back into the hazard zone, was of no real significance to Lamadeleine.

¶ 245 Again it should be noted that it is clear, on the evidence, that notwithstanding Lamadeleine's advice to his insurer following the OMB hearing, advising the insurer that his land was in a hazard zone, the only coverage that was deleted from the policy by the insurer was property damage due to landslide. All other coverage remains in place including liability coverage. It should also be noted that at no time prior to the OMB hearing in February of 1997 did Lamadeleine advise his insurer that he was in a landslide hazard zone although he knew that to be the case.

¶ 246 Lamadeleine, on behalf of the plaintiff, has made a personal decision not to carry on in the building the business of a theatre restaurant notwithstanding that the plaintiff is perfectly entitled in law to do so.

¶ 247 In paragraphs 19 and 20 of the statement of claim it is alleged that in 1996 the plaintiff intended to sell the restaurant and theatre building and had obtained appraisals establishing the value of the buildings and property at $650,000.00. The plaintiff further alleges that the proposed purchaser, pursuant to due diligence obligations, contacted the South Nation River Conservation Authority and was advised that the plaintiff's land was in an area susceptible to retrogressive landslides and that as a result the proposed purchaser did not complete the purchase of the plaintiff's land.

¶ 248 On the evidence, the only person who ever expressed the slightest interest in possibly purchasing the plaintiff's property was Rita Benson who was involved in the restaurant end of the plaintiff's business from 1992 to 1996. It was her evidence, which I accept, that it was Lamadeleine who first approached her to tell her that he was interested in selling the property. No price was ever discussed nor was any appraisal ever shown to her. It was around the end of 1996 or the beginning of 1997 that Lamadeleine told her that he could not sell his property to her because it was in a danger zone.

¶ 249 At Tab 105 of Exhibit 4 is solicitor Laviolette's letter to the Township of Cambridge dated May 13, 1996 advising that her client is interested in purchasing the subject property and asking confirmation that the property is not "within the sensitive slope protection". Ms. Benson knows Ms. Laviolette and confirmed to Mr. Rasmussen on cross-examination that she never hired Ms. Laviolette to do anything for her with respect to a possible purchase of the property nor did she ever see the responses from the Township and the Authority to Ms. Laviolette which are located at Tabs 106 and 107. Nor did Ms. Laviolette ever communicate with her about the plaintiff's property. It would seem clear that Ms. Laviolette's inquiries were being made at the instance of Lamadeleine. While Lamadeleine suggested in his evidence that he had made inquiries of the Caisse Populaire on behalf of Ms. Benson to determine whether or not financing of the purchase of the property would be available, Ms. Benson in her evidence, which I accept, testified that she never asked Lamadeleine to make any inquiries with any financial institution to determine if there was money available to assist in the purchase of the property.

¶ 250 On the evidence there was never any likelihood that Ms. Benson would have, in any circumstances, purchased the plaintiff's property at

anywhere close to the witness Lemay's 1993 appraised depreciated value of $640,000.00. Ms. Benson, while operating the restaurant for the plaintiff, also operated her own catering business out of her home. She was lacking space and wanted to buy a larger place and because of that thought of purchasing the plaintiff's business. She eventually bought a property in May of 1999 in Casselman in the industrial park and paid $130,000.00 for it.

¶ 251 In all of the circumstances I am satisfied that although the defendants' conduct fell below the standard of care to be expected of them as outlined in these reasons, the plaintiff did not suffer any damages as a result of that conduct. He is essentially in no worse position than he was in 1989 when he was operating a restaurant theatre business on a site that his own expert, Morey, had told him was not safe from retrogressive landslides unless very significant remedial work was performed. He has known all along what the risk was in building to the north of the east west ravine without doing the remedial work and he has now decided not to operate the business in the face of that risk.

¶ 252 In all of the circumstances, the plaintiff has not suffered any damages as a result of the defendants' conduct. The plaintiff's action is therefore dismissed.

¶ 253 With respect to the matter of costs, in the absence of any Rule 49 offers to settle, my inclination would be to have each of the parties bear its own costs in this action. I will, however, reserve on the matter of costs pending written submissions from the parties.

MORIN J.

SCHEDULE `A'

LA SUCRERIE CASSELMAN INC.

and

THE CORPORATION OF THE TOWNSHIP OF CAMBRIDGE, JACQUES WHITFORD LIMITED and JOHN D. PATERSON AND ASSOCIATES LTD.

SUMMARY OF EVIDENCE

This is an interesting case in which the plaintiff claims to recover from the defendants, damages in the amount of $800,000.00. The claim against the consulting engineers is framed in negligence having regard to the advice that they gave to the plaintiff with respect to the location of the plaintiff's building along the banks of the South Nation River. The claim against the municipal defendant is also framed in negligence on account of their issuing a building permit for the building.

Counsel for the plaintiff, Mr. Leamen, opened by outlining the evidence that he anticipated that would be put before me. The subject property owned by the plaintiff is located along a 17 kilometer stretch of the South Nation River which has been subjected to retrogressive landslides for over 100 years. The latest slides occurred in 1971 and 1993. The Ontario Government became concerned about the problem in 1971 at a time when Highway 417 was planned to cross the South Nation River.

On August 4, 1990 the plaintiff's building, a combination sugar shack and summer theatre located on the subject lands, was destroyed by fire. The building had been built less than two years before. The principal of the plaintiff company, Conrad Lemadelaine, obtained insurance proceeds and wished to rebuild the building on the same site.

The plaintiff applied for a building permit. The defendant municipality required the plaintiff to obtain an opinion from a geodetic engineer that the site was suitable for reconstruction having regard to the possibility of a retrogressive landslide into the South Nation River. The plaintiff retained the defendant engineering firms to provide the opinion. They said, essentially, that it was safe to rebuild on the same location and the municipality accordingly issued a building certificate and the plaintiff reconstructed the building.

A significant retrogressive landslide occurred on June 20, 1993. The South Nation Conservation Authority (SNCA) had, a few months before that landslide, issued a report with respect to the area in which the slide had occurred. The slide in June of 1993 retrogressed 700 meters from the shoreline, that is, the stability of the land collapsed for a distance of 700 meters from the shoreline. The 1971 landslide had retrogressed some 450 meters. The plaintiff's building, as reconstructed, is located 170 meters from the shoreline.

It is the plaintiff's position that the building is now useless. Subsequent to the 1993 landslide an employee of the plaintiff had expressed an interest in buying the business. The prospective purchaser's solicitor made due

diligence inquiries of the defendant municipality and the SNCA. The SNCA advised that the building was not in a safe location. A study of the problem had resulted in official plan amendment #51 which proposed set back lines that would have included the plaintiff's building site as "hazard lands". The plaintiff complained to the planner and, as a result, the set back lines were drawn to exclude the plaintiff's building. The SNCA became concerned and opposed the redefining of the set back lines and eventually the OMB restored the original set back lines.

The plaintiff alleges that the defendant municipality throughout was aware of reports which indicated that the site was unsafe. The last report received was from professional engineer McCrosty. The plaintiff's building sits empty today.

THE EVIDENCE

At the opening of trial a plot plan was filed as Exhibit 1 which shows the plaintiff's lands along the South Nation River. At the site the river flows in a westerly direction. I was told that I would hear evidence that if one were to run a straight line from the present building site to the south shore of the river, parallel to the west and east boundaries of the subject property, the distance would be approximately 450 meters. On the other hand, if one were to draw a line from the building site to the closest point of the river, the distance is something in the order of 200 meters. I was told as well that the building is situated north of a gully shown on the plot plan and that if the building had been located to the south of the gully it would have been protected from retrogressive landslides.

Filed as Exhibit 2 is a site air photo showing the location of the plaintiff's lands and its position adjacent the South River Nation as the river flows west, curves north and then flows east. I was told that subsequent evidence would disclose that areas of earlier landslides would be pointed out on Exhibit #2.

Filed as Exhibit A numbers 1 to 5 subject to further identification were photos of the 1993 retrogress of landslide taken by the Ottawa Citizen. These photos were received subject to a qualified witness testifying as to what they depicted and the location of the depiction on the South Nation River. I was told that this particular slide was not in the area of the subject property.

Put before me as well at the opening of trial was a chronology of events prepared by plaintiff's counsel. It was received with the consent of all counsel on the understanding that the chronology did not constitute evidence but would assist me in understanding the sequence of events as established by appropriate evidence.

THE CASE FOR THE PLAINTIFF

First Witness: Clifford Morey

Examination-in-Chief

Filed as Exhibit 3 was Mr. Morey's CV. He is a registered professional engineer, a member of the Canadian Geo-technical Society and a designated consulting engineer. He received his geological engineering degree from Queens University in 1973 and his MSC (ENG) Civil Engineering from Queens in 1977. He took graduate courses in civil and geo-technical engineering at the Universities of Windsor and Carleton in 1980 and 1982. He was employed as a geo-technical engineer by Golder Associates Limited from 1980 to 1994 during which time he did subsurface investigative work and slope stability evaluation analysis in the area of the South Nation River. He has performed a half dozen geo-technical investigations on the South Nation River along its length between Casselman and Lemieux and beyond those limits has conducted another 10 or 12 geo-technical investigations on the river. Mr. Morey left Golder Associates Limited in 1994 and since that time to the present has been president of his own engineering firm carrying out geo-technical and hydro-geological investigations and environmental site assessments. He continues to this date to do work in connection with the South Nation River. He testified that he was not aware of anyone who has done as much work as he in connection with the South Nation River.

Filed as Exhibit 4 were four volumes of documents consisting of the plaintiff's productions and some of the productions of the defendants. The four volumes were received in evidence on the understanding that other than those of the plaintiff's documents admitted by the defendants in answer to the plaintiff's notice to admit, the documents would be proven in the normal course during the course of the evidence being adduced.

In 1985 Golder Associates had been asked to do a slope analysis downstream of Casselman at an area known as the Sequinbourg Development. It was a residential development with a mix of older and newer homes located close to the South Nation River. At that time Golder Associates put down three bore holes and did a slope stability evaluation by computer analysis. Based on the results, it appears that the stability of the

slopes of the South Nation River in that area was less than adequate for development close to the crest of the slope. It recommended that remedial work be done including a large rock filled berm at the bottom of the slope some 20 to 30 feet wide and extending 5 meters above the water level. It was also recommended that one particularly steep slope be flattened. This berm work was done over a distance of approximately 1 kilometer along the river and resulted in a safety factor of 1.3.

At Tab 13, Exhibit 4, is a letter from Golder Associates addressed to the South Nation River Conservation Authority dated July 15, 1988 confirming Golder Associates' interest in continuing to provide geo-technical services to the authority relating to slope stability along the South Nation River and to outline a proposed methodology for investigating the stability of the slopes along the river between Casselman and Lemieux, Ontario. Golder Associates was in fact retained by the Conservation Authority for that purpose and Morey was project engineer. The retainer was prompted by the Ministry of Natural Resources. That particular stretch of the river was of particular interest because of the retrogressive landslide along that stretch of the river in 1971 and the growing wish to develop along the river in the face of safety concerns.

The letter of July 15, 1988 outlined a three-phase plan.

At Tab 15 of Exhibit 4 is the Golder Associates report dated September 1988 relating to Phase 1. Morey was responsible for producing this report. At page 2 of the report it is noted that the study area consists of some 20 kilometers of the banks of the South Nation River from about 1 kilometer northwest of the Town of Casselman to about 2 kilometers north of the Village of Lemieux. The report notes at page 2 that a review of air photos of the South Nation River between Casselman and Lemieux indicates that at least 15 retrogressive type slope failures have occurred historically along this 20 kilometer section of the riverbanks. If one looks at Exhibit 2, the site air photo, one can see two readily visible slide areas across the river from the plaintiff's property.

Marked as Exhibit 5 was figure 2 from the Golder Associates report at Tab 15, Exhibit 4, which shows the two retrogressive landslide areas across the river from the plaintiff's property and two other such landslide areas immediately to the west, and on the same side of the river as the plaintiff's property. The river is approximately 100 meters wide.

Exhibit 5 also shows ten other retrogressive slide areas. The number of such retrogressive slide areas is significant in that it shows the activity along the shores and the tendency for retroactive landslides along the river. It should be noted that the landslide site marked as "M" on Exhibit 5 dates back to 1895. The landslide site "H" dates back to 1910 and the landslide site marked as "I" on Exhibit 5 dates to 1971.

The slide sites shown on Exhibit 5 were plotted on Table II appended to the report of September 1988 (Tab 15). The width and distance of retrogression from the river edge of each of the landslides is indicated in Table II. The distance of retrogression from river edge varied from 50 meters to 650 meters. As Morey put it, these slides are an indication of what happened in the past and what might happen in the future.

For the purpose of this report, MNR selected 15 sites for bore holes and Golder Associates put down 22 bore holes at the 15 sites. At some sites bore holes were placed both at the crest and at the toe of the slope. Following completion of drilling, piezometers were placed at different levels in the hole to measure ground water in the slope and to provide a profile of ground water in the slope. Further, profiles in the slopes in terms of steepness and height were developed. The bore holes generally disclosed an upper sand layer over silty clay that became stiffer the deeper it went. Essentially what was seen was clay slopes with sand caps. Test results indicated that the toes of the slopes were very unstable and some of the steeper slopes had safety factors of less than 1.5 while some had safety factors of more than 1.5. The safety factor of 1.5 is the ratio of forces that resist failure over forces that tend to cause failure and is determined by a computer analysis. A 1.5 safety factor ratio is considered safe in the industry. Anything below 1.5 is considered questionable and as the ratio approaches 1 the risk of failure increases. If the factor is below 1 then the slope has in fact failed. Generally the conclusion drawn from all of the analysis by Golder Associates was that there was potential along the river for retrogressive landslides.

At page 9 of the report there is reference to the ground water conditions as ascertained by the piezometers in each of the bore holes. The results indicated that the riverbank is generally saturated below a depth of 1 to 2 meters where the sand cap is relatively thin and where the sand cap is significantly thicker the slopes are saturated below a depth of about 4 to 5 meters. It is noted that at all sites the ground water measurements indicate that downward flow of the ground water is occurring within the slopes.

At page 11 of the report at Tab 15 the theory of landslide retrogression is set out. In a nutshell there are three steps to the occurrence. Initially, the earth flows are initiated by a simple rotational failure of the slope either

near the toe or possibly up to the crest of the slope close to the riverbank. Upon this occurrence the landslide debris may either stay intact or may flow and almost liquefy. If it stays intact it simply slumps and stabilizes the material behind it. It if flows, it leaves the area and leaves a steep backscarp. If the backscarp has a safety factor of 1.0 or less, it will then fail and slice off and liquefy and flow out into the river. That phenomenon continues until the backscarp becomes stable either because it is lower in height or because it consists of more stable material. All this can happen very quickly, perhaps in one or two hours.

At page 14 of the report is a formula which is used to calculate the estimated retrogression distance in meters. The formula is R=(Ns-4)100. R is the estimated retrogression distances in meters and Ns is the maximum stability number calculated for a specific slope.

At page 14 of the report under the heading "RESULTS" it is noted that computer analysis has been carried out to determine the factor of safety of the slopes against initial failure. As earlier pointed out, the factor of safety of a slope is a ratio of the magnitude of the forces which tend to cause a slope to fail to the magnitude of the forces which tend to resist failure. Theoretically, a slope with a factor of safety of less than 1 will fail and a slope with a factor of safety of greater than 1 will not fail. It is noted that for the purpose of the study a computed factor of safety of 1.0 to 1.3 is considered to indicate an unstable slope condition while a factor of safety of 1.3 to 1.5 is considered to indicate a slope which is less likely to fail in the long term and provides a degree of confidence against failure ranging from marginal to adequate should actual conditions vary from the assumed conditions. A factor of safety of 1.5 or greater is considered to indicate long term stability provided the slope profile is not steepened by toe erosion or by other means.

Morey's analysis showed slopes with safety factors of 1 to greater than 1.5. Overall then, there was generally a potential for retrogressive landslides.

Exhibit 5A is a portion of the report of September 1988 at Tab 15. Referring to Exhibit 5 the site plan which has indicated on it the bore hole numbers, Morey explained that in Exhibit 5A the slope profile drawn at figure 6 is the closest slope profile to the plaintiff's lands. In figure 6 it is described as Slope Profile - site 1 / 2. Those numbers refer to bore holes number 1 and 2 as shown on site plan Exhibit 5. Number 1 bore hole is near the top of the slope and number 2 bore hole is near the toe of the slope. Morey's analysis of site 1 / 2 is that it was a sensitive clay site with a minimum safety factor of 1.0 in the toe and an overall safety factor of 1.4. Compared to other sites, it was Morey's evidence that site 1 / 2 had a higher factor of safety than other sites analyzed at the time.

Referring still to figure 6 in Exhibit 5A, Morey explained that the slope designated as slope A on figure 6 is a profile of the original slope that failed in 1971 engulfing slope A2. He pointed out that existing slope site 1 / 2 is quite similar to slope A2 but very different from the profile of the original slope A.

At page 18 of the report of September 1988 under the heading INTERPRETATION OF RESULTS it is noted that the results of the computer stability analysis indicate that all sites investigated except for designated sites which do not include site 1 / 2, have the potential for either slope toe or overall simple rotational instability either of which could initiate a retrogressive landslide.

Referring to page 20 of the report under the heading ADDITIONAL INVESTIGATIONS Morey explained that this report dated September 1988 addressed phase 1 and he on behalf of Golder Associates requested permission to proceed with phase 2 to better delineate the area as more or less prone to retrogressive landslides and to determine more or less the costing for the remedial work required. The report of September 1988 was delivered to the Conservation Authority at that time. It was the result of investigative work performed from January to March of that year.

After delivery of the September 1988 report Lemadeleine, owner of the plaintiff company, came to Morey's office and asked Golder Associates to carry out an investigation of his site. Initially Morey suggested that Lemadeleine go to other consulting engineers because he was concerned that there might be a conflict, Golder Associates being retained by the Authority. Lemadeleine persisted. Morey conferred with the Authority and his own people and it was decided that Golder Associates could be retained by Lemadeleine directly to investigate his site. At Tab 17 there is a letter from the South Nation River Conservation Authority to Morey which reads in part as follows:

> I have recently received a letter from Conrad Lamadeleine. The property in question appears to be located within the designated earth flow zone and a 125 meter set back established from the road. The area in question in included in the current Casselman to Lemieux study undertaken by your firm for the Authority. Would it be possible with the existing available

information to advise Mr. Lamadeleine about his proposed development.

At Tab 23, Exhibit 4, is the report prepared by Morey for Lamadeleine and dated November 1988 and at Tab 20 is a brief interim report of the results of slope stability evaluation carried out at Lamadeleine site. That interim report is dated October 20, 1988.

Morey had been told by Lamadeleine that he wanted to build a new theatre building on his property which was in a hazard zone and as a result he needed a site specific study to hopefully show that he was not in danger of a retrogressive landslide. After being retained, Morey placed a bore hole on the Lamadeleine site, did lab work, did analysis of the slope and eventually came up with a report. The hazard zone established by MNR of some 800 meters from the riverbank, and which had been established for approximately 10 years at the time, encompassed the plaintiff's lands.

Referring to his report at Tab 23 Morey confirmed that the bore hole put down on the plaintiff's land indicated that the ground material was material common to the area, sensitive, silty clay with high liquidity content. It was essentially the same material as determined at other sites. Morey explained the purpose of the analysis at the plaintiff's site was to determine if it was potentially a site for a retrogressive landslide.

The interim report provided to Lamadeleine by Golder was to determine if his slope was prone to retrogress of landsliding. The interim report found that the general site area was susceptible to retrogressive flowsliding but "probably not susceptible to the more devastating earth flow form of landslide". See Tab 20. That having been determined, Morey then had to determine whether the plaintiff's site would retrogress and, if so, how far.

At page 9 of the report of November 1998, Tab 23, the following is noted:

> The stability numbers for the slope at this site have been calculated based on the results of the in situ, vane shear testing carried out in the bore hole. The calculated stability numbers range from about 1.0 to 5.9. All calculated stability numbers based on the in situ vane shear strength obtained below a depth of 7 meters are greater than 4. Accordingly a steep failure backscarp at this site would be considered unstable in an undrained state thus satisfying the criteria for retrogressive undrained failure.

Using the highest stability number Morey came up with the formula at page 8 of the report namely R=(Ns-4)180 as previously referred to. The following is noted at page 8 of the report under the heading RESULTS.

> The above discussion outlines a theory of landslide retrogression. In brief, this theory considers that if a slope or a portion of a slope has a factor of safety against failure of 1.5 or less and the calculated stability number, Ns, within any portion of the slope is less than 4 and the slope consists of sensitive clay material a portion of which has a liquidity index of greater than 1.2, then there is a relatively high potential for the slope to experience landslide retrogression. For the particular site in question, landslide retrogression distance can be estimated using the previously explained formula R=(Ns-4)180.

At page 10 of the report under the heading REMEDIAL WORKS, it is noted that the results of the investigation indicate that a retrogression landslide encompassing table land to some 340 meters back of the river shoreline is possible at the site. It is recommended that prior to construction of the proposed theatre building, steps be taken to ensure that the proposed theatre site will not be endangered from a retrogressive landslide. It is further recommended that a safe set back distance from the river shoreline for building construction at this site is considered to be 400 meters and that that set back distance may be substantially reduced by ensuring that initial failure of the riverbank does not occur. It is recommended that flattening of the slope toe area at the river edge to an inclination of 3 horizontal to 1 vertical be performed together with some upper slope flattening and providing erosion protection using armour stone rip rap and geo-textile in the lower portion and mulch and seeding for the upper portion. At page 11 of the report it is noted that the length of riverbank along which the remedial work should be carried out depends on the actual location of the proposed building and the distance between the proposed building and the riverbank. It is noted that once the desired location for the proposed building has been chosen, the extent and details of the riverbank remedial works can be determined.

Morey explained that if the building was located 400 feet back from the shoreline, then no remedial work at all would be required. If the building was to be located closer than 400 feet, then the remedial work was required.

Referring to Exhibit 2, Morey pointed to the gully which runs generally in an east west direction across the southern portion of the plaintiff's lands. Morey explained that all of the area to the south of the gully which is

marked with hatch marks is safe from retrogressive landslide. This fact was clearly pointed out in Morey's report of November 1988. Morey further explained that Lamadeleine could then have chosen a site for his theatre fully protected by the gully but that Lamadeleine wanted to put his building somewhat further to the west of the west end of the gully. Morey recommended that if that was the case, then Lamadeleine would have to widen, deepen and extend the gully. Morey explained that major ravines or a gully such as on the plaintiff's property act as a barrier or limit beyond which flow side or earth flow retrogression does not extend. This is discussed at page 11 of this report.

After delivery of the report, Morey was called to the site by Lamadeleine to see the remedial measures being executed on the gully. At that time Lamadeleine was clearing an area on the south side of the gully for the new building. At Tab 25 is Morey's letter to Lamadeleine dated December 28, 1988 which reads in part as follows:

> With regard to the remedial works carried out at this site the results of the inspection on November 23, 1988 indicated that the existing ravine had been sufficiently extended and deepened to provide adequate protection against the possibility of a landslide for a building located on the south side of the ravine and east of the west extent of the ravine.

At Tab 31 is an internal memo from the Ministry of Natural Resources referring to revised set back lines and related concerns that had been discussed with Mr. Morey. Morey confirmed in his evidence that he continued to remain involved with this issue.

At Tab 34, Exhibit 4, is a letter from Morey to Lamadeleine dated April 21, 1989 clarifying his earlier letter regarding the inspection of the remedial work on the gully and confirming that the remedial work alternative chosen and carried out consisted of deepening the existing east/west running ravine at the site and extending the ravine westward beyond the proposed building location.

At Tab 37 is a letter from Morey to Gore & Story dated May 1, 1989 referencing a "new set back hazardous zone" which originated within a proposal dated January 23, 1989 submitted by Gore & Story to the Conservation Authority. Morey was concerned about Gore & Story using Golder's broad term report (phase 1) to designate the old 20 kilometer area as a hazard zone when there could very well be exceptions along the riverbank. It should be noted that Gore & Story were the environmental engineers retained by the Authority to prepare an environmental assessment.

At Tab 41 is a letter from Golder Associates to Gore & Story dated May 18, 1989 which again expressed concern about the whole area being defined as a hazard area and which also expresses concern about drawing the line of the hazard area at the municipal boundary.

At Tab 44 there is a letter from Morey to Gold & Story dated May 31, 1989 which references inter alia the work done by Morey for Lamadeleine. The letter confirms the following:

> The bore hole at Mr. Lamadeleine's property was put down to augment the subsurface information already available from bore holes previously put down on either side of his property during the phase 1 portion of the Casselman to Lemieux study carried out by Golder Associates Limited. The information from this bore hole and the previous adjacent bore holes was used to determine and appropriate set back from the South Nation River for building construction at this site as well as to provide sufficient information to assess the feasibility and enable design of remedial measures.

At Tab 53 is the letter from Morey to Lamadeleine dated July 27, 1989 with respect to an area to the east of the subject lands also owned by Lamadeleine and marked with an "X" on Exhibit 2.

At Tab 54 is Golder Associates report dated August 1989 which relates to phase 2 of the work undertaken by Golder Associates for the Conservation Authority. This report related to the same area, that is the South Nation River running from Casselman to Lemieux excluding the Sequinburg Development. Again, it was part of the environmental site assessment to put a dollar value on the engineering solutions required to avoid retrogressive landsliding. Morey explained that Gore & Story provided cross sections. Morey looked at the slopes on the cross sections and compared this to his own data to come up with preliminary remedial measures and thus to give Gore & Story a preliminary indication of what was required by way of remedial measures so that Gore & Story could come up with a general cost figure. Beginning at page 4 of the report the following is noted:

> The above-noted reference report on the 1971 retrogressive landslide southeast of Lemieux included the results of stability

analysis of the slope which is considered to have initiated that landslide as well as other slopes believed to have been engulfed in the landslide retrogression. Profiles of these slopes were provided in the report. In addition, as part of our previous overview of the riverbank's slopes within the study area, the results of detailed slope stability analysis are available for some additional 15 existing riverbank slope profiles. As a result of both of these previous studies factors of safety are available for a relatively wide range of slope profiles throughout the study area having calculated factors of safety ranging from about 1.0 to greater than 1.5.

Morey explained that for the purpose of this report using available data, he eventually assigned factors of safety to each of the Gore & Story slopes ranging from 1.0 to 1.5. He believes that the slope analysis set out in Section 2A1 appended to the report is close to that of the plaintiffs but was unable to confirm without referencing a map. He explained that the plaintiff's property would be on what is marked as the left bank in Section 2A1. Referencing Section 2A1 Morey explained that there were three available remedial measures depending on the site:

(a) if the site was not unstable then simply place rip rap at the toe of the slope;
(b) if the area was medium unstable then place a berm at the toe of the slope; and
(c) for the most unstable areas regrade at 4 or 5 to 1 and provide rip rap at the toe.

If Section 2A1 does represent the plaintiff's slope then the work required as indicated on that slope, that is rip rap at the bottom and regrade 4 to 1, would show it to be one of the most unstable areas.

At this point in his evidence Morey was taken back to his November 1988 report to Lamadeleine at Tab 23 and there was marked as Exhibit 6 a slope profile schedule which would have been attached as a schedule to the original report.

Referencing Exhibit 6, Morey explained that the slope profile labelled as Existing Slope Surface At Bore Hole 1 is the slope at the plaintiff's site. The slope profile designated as 1971 Slope A is the slope before the 1971 slide. The slope profile designated as Existing Slope Surface At Site 1 / 2 is again the slope at the plaintiff's property and the slope marked 1971 Slope A2 is the slope engulfed by the 1971 slide. On my own copy of Exhibit 6 I have these slopes marked 2, 1, 3 and 4 respectively. Morey explained that he used the slope profiles to determine if the plaintiff's land had a factor of safety of less than 1.5. He had previously computed a factor of safety of 1.4 at site 1 / 2. He knew that the 1971 slope had a safety factor of 1. He pointed out then that it could be seen from the slope profiles that the existing slope surface at bore hole 1 is between the 1971 slope and the slope surface at site 1 / 2 and is therefore between a safety factor of 1 and 1.4 and therefore unstable. Again he confirmed that they had previously evaluated site 1 / 2 and determined that there was an overall safety factor from the toe to the crest of 1.4. The specific safety factor at the toe was 1 and was therefore on the verge of failure. Indeed it actually failed a couple of years later engulfing bore hole #2 which had been placed there thus confirming for Mr. Morey the accuracy of his analysis. In other words, on his analysis the safety factor at the toe was 1 and that was confirmed by the fact that it did, a couple of years later, actually fail.

By the same token with respect to Lemieux, Morey calculated a safety factor of 1 for a particular slope and soon after that calculation it failed.

This leads Morey to be confident in the accuracy of his analysis and that what happens after the computer analysis eg failures, confirms the accuracy of the analysis itself where the analysis has been a safety factor of 1.

Morey was asked whether or not there was any determination as to whether the landslide sites across the river from the plaintiff's property had slopes similar to the plaintiff's slopes prior to the slide. Morey testified that he could not tell exactly although there were still remnants of what the slope was like before beside the present slide site and he felt that it was comparable to the slope at the plaintiff's site in terms of inclination and height.

Morey had a recollection of meeting at the plaintiff's site with a number of people including the Mayor of Cambridge, a representative of the MNR, Conservation Authority and council and the plaintiff. He does not recall whether the meeting was before or after the burning down of the first theatre. The plaintiff had called the meeting so that everyone could see the remedial work performed to the riverbank.

As well Morey recalls visiting the site on another occasion and observed a drill rig in the location of the theatre. This was probably after the fire and the plaintiff advised him that he had retained the two defendant consulting engineering firms to do work for him. Subsequently Morey spoke to a representative of the defendant Jacques Whitford Limited and offered his

experience along the river and the information that he had. It appears that the offer was declined.

After this the witness continued doing work for the Conservation Authority. At Volume 3, Tab 89, is Golder Associates report to the Conservation Authority dated April 13, 1993. This report involved looking at specific positions on the river to provide an estimation of potential landslide distances. The plaintiff's site was not among those looked at. Prior to the report Golder Associates had been asked by the authority to look at the river and determine if there were any areas that were not subject to retrogressive landslides because of the shape of the slope based on the analysis to date. Golder Associates proposed several potential sites where there might not be remedial work required. Out of those potential sites the authority chose several. The plaintiff's site was not one that was offered by Golder Associates as a candidate for no remedial work.

The major landslide at Lemieux in June of 1993 was right in the area that Morey had investigated and again it verified his analysis and his formula. By his analysis as determined by the formula, the retrogressive distance had been calculated to be 774 meters and the actual retrogressive distance was 650 to 700 meters. No repair work had been done at the Lemieux landslide site although Morey had advised that it was a potential site for a retrogressive landslide and had recommended certain remedial procedures.

Finally, at Tab 92 is the draft amendment to the official plan. The Conservation Authority had provided Morey with the draft plan to see if it reflected his views. It was his evidence that it did mostly but not completely.

Cross-Examination of Morey
by Mr. Rasmussen

Morey confirmed that with respect to Phase 1 of his report the Authority had concluded that the river was susceptible to retrogressive landslides and wanted more work performed to determine the degree of susceptibility. In furtherance of the work involving a study over the 20 kilometer length of the river, bore holes were put down on 15 sites and on each of these sites profiles of the slope were taken. As well piezometers were put down the bore holes in order to determine water levels and after the piezometers were installed the Authority took the readings on a weekly basis.

As a result of the data collected and the analysis Morey was able to say that most of the 20 kilometers could be susceptible to retrogressive slides. Indeed, there were along the 20 kilometers, scars of some 15 retrogressive slides that had already occurred. Some of the sites chosen for bore holes were right beside the scars. Morey explained that there was no point in putting a bore hole in the scar itself. As it turned out, one of the bore holes put down was exactly at the site of the 1993 landslide at Lemieux. Morey explained as well that there is bore hole material available from the 71 slide and indeed it provides the theory on which to determine formulas. The actual 71 bore hole material is not in the report.

Morey explained that once there is a failure at the shoreline the land keeps giving away or retrogressing until one of three things occur:

(a) the retrogression gets close to a ravine;
(b) the backscarp is not as high; or
(c) the river fills up and more material is unable to move into it.

His theory was developed on the basis of observations in the South Nation River. Morey saw many retrogressive landslides that were confined by ravines. Indeed that observation was made with respect to the 1971 and 1993 retrogressive landslides. Referencing Exhibit 5, the site plan of the river, Morey testified that this "ravine phenomena" could be seen at landslide site #I and landslide site #C. Landslide site #1 was the site of the 1971 slide. The 1993 slide occurred between bore hole numbers 22 and 18 shown at the top of Exhibit 5.

Morey confirmed to Mr. Rasmussen that all of the soil along both sides of the river was deposited at the same time. He confirmed that for the purpose of the phase 1 report no bore holes had been taken in the actual retrogressive slide areas but again stipulated that some bore holes were placed right beside the slide areas, eg bore hole 19.

In answer to my question as to why they would place several bore holes if all of the soil along both sides of the river was the same and was deposited at the same time, Morey answered that the several bore holes were done "just to be sure".

When Rasmussen suggested that most of the retrogressive landslides had occurred close to Lemieux, Morey pointed out that 4 had occurred in the immediate area of the plaintiff's property. They are marked as A, B, C and D on Exhibit 5. In any event, Morey confirmed that based on the data

collected and his analysis of it, he concluded that retroactive landslides were possible all along the river.

Morey explained that the factor of safety previously referred to in his evidence has to do only with the initial failure at the shoreline and many factors come into play to impact on the factor of safety in any particular location, namely height, cohesion, unit weight, amount of moisture in the soil.

In determining the factor of safety, Morey used the water levels as recorded by the piezometers as a starting point but eventually for the purpose of analysis used numbers that were greater than the water pressure actually recorded. At page 6 of the report dated September 1988, Tab 15, the following is said:

> The ground water conditions used for the stability analysis were based on the ground water levels measured in the bore hole piezometers at each site. The highest measured ground water levels were used and in general increased somewhat to simulate the most severe spring ground water conditions. As well, ground water levels in the slope toe area were varied to simulate the high spring flood conditions followed by rapid river water level drop. It is understood that this condition has been observed in some portions of the river when ice jams suddenly collapse.

Morey went on to explain that for the purpose of Phase 1, having collected the data they then looked at previous known data, eg data arising out of the 1971 slide, and then tuned their analysis by reference to known factors of safety in known slopes, eg it was known that the slope in the area of the 1971 slide had a factor of safety of 1. As well, for the purpose of the Phase 1 analysis Morey looked at the Sequinburg Development where a slope had failed and analyzed that. He explained that the porewater pressures at the site of the 1971 slide and the Sequinburg slide were known.

Rasmussen suggested to Morey that in using the data in the phase 1 analysis, he made certain assumptions with respect to porewater pressure. Morey declined to characterize it as an assumption. He said rather that he adjusted the collected data based on information available from the field and "made it fit with what we knew occurred". He went on to explain that he had for the purpose of his calculations, increased the measured porewater pressure somewhat based on the fact that he felt that they had not measured the highest porewater pressure. He then co-related that "assumption" to what he saw happening in the field to make sure that he was not being extreme in the increase.

Again Morey pointed out that he had data from bore holes in the areas where slides eventually actually occurred and he was therefore confident in his calculations. He explained further that all good engineers develop a model to massage raw data so that they can be confident in the final analysis. The model that he uses is to input measured data and then make sure that it reflects what he sees happening in the field, eg in known slide areas. In that respect the only thing that he adjusts is the porewater pressure. By way of example, if the "unadjusted" data results in an analysis of a safety factor of 2 and he knows as a fact that immediately beside the site there is a safety factor of 1, he must conclude that the result of 2 is not correct and it must be adjusted to correspond to reality.

He explained further that in order to make the model work and to correspond with what he sees in the field, he adjusts the porewater readings based on the porewater readings previously taken from known landslide areas.

Morey believes that the raw data from the 1971 slide was available in the literature. He believes he saw all that data including soil information, slope profile and piezometer readings. It was all available because the 1971 slide occurred at a bridge site where bore holes had been put down as a precautionary measure prior to the slide.

Again he explained that Phase 1 work related to factor of safety computations only. He analyzed the results from the 15 bore hole sites, incorporated the data available from the 1971 site and came up with a result. He explained that if one were to apply the methodology to a particular slope and get a safety factor of 1.2 and then apply the same methodology to the data available from the 1971 landslide area (prior to the landslide) and get a 1.2 safety factor, then one knows that something is wrong with the methodology because it should yield a safety factor of 1 for the 1971 site.

Mr. Morey started the day (June 7th cross) by confirming that he had at the time of his investigation, the bore hole material from the 1971 retrogressive landslide obtained prior to the landslide. He explained that several bore holes had been put down by MNR prior to the slide and he had that data. He also had the Mitchell report. Mitchell had written a great deal on the phenomena as had Professor Guy Lefebvre who was present in court at the time of Mr. Morey's evidence.

Mr. Morey confirmed for Mr. Rasmussen that the theory of the retroactive landslide involves the following criteria:

(a) there must be a failure in the toe area;
(b) then the material behind that failure is not stable enough to stand alone and collapses.

A factor known as a factor of safety is used in analyzing the possibility of the initial failure of the toe and a stability number (Ns) is used to determine the extent that it will retrogress once there has been an initial failure. In determining the factor of safety the porewater pressure at the toe is important and Morey, in doing his calculations, considered that the actual porewater pressure might be greater than that being measured. This is particularly so at the toe because of, among other things, ice dams causing a rise in the water and then a sudden break and a sudden draw down. It was factors such as these that Morey thought might effect porewater pressure. Porewater pressure by the way is more commonly known as ground water pressure. It is measured by taking the weight of water over the height of water.

Morey conceded to Mr. Rasmussen that in using slope profiles up and down the river to predict factors of safety if one uses different porewater pressures then the predictions may not be as accurate. Most accurate factors of safety can be obtained comparing profiles if all the other factors are constant including porewater pressure but even if all other factors are not constant, one can obtain at least a general idea of the factor of safety.

At Exhibit 4, Tab 15, is Morey's September 1988 report to the Conservation Authority. Morey conceded that the report discloses a very definite trend starting from bore hole 21 moving downstream and that trend is that the stability number (Ns) increases as one goes downstream. See page 16 and 17 of the report and Exhibit 5. In the report beginning at page 16 the following is stated:

> ... Previous landslide activity along the river is shown as linear meter of retrogressive landslide per kilometer of river. As well, scaled retrogression distances of major landslides are plotted. It is evident from figure 24 and figure 2 that landslide activity increases significantly downstream of bore hole #10 where in general the Ns is greater than 7. The largest retrogressive landslides have also occurred in this downstream portion of the study area. It is note worthy that no major retrogressive landslides have occurred close to bore hole sites near the upstream end of the study area where the stability numbers for the slopes are less than 6.

The area being referred to at pages 16 and 17 of the report is halfway through the study area. One can better understand this evidence if one looks at Exhibit 5, the first bore hole number upstream is number 20 yet as one goes downstream the numbers are 20, 21, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 and bore hole 10 is indeed approximately half way down the study area.

Entered as Exhibit 7 is a map of the South Nation River in our area showing the location of the Lemieux landslide and what are termed historical sensitive clay flows (landslides).

In the face of all this, Morey conceded the following:

1. the incidents of landslides are greater as one goes downstream;
2. the largest landslides have occurred downstream;
3. no landslides have occurred upstream of bore holes 1 and 2.

Mr. Morey conceded that the stability number (Ns) is related to the height of the slope and the slope gets higher as one goes downstream.

Figure 24 at the back of the report, Tab 15, is a graph of stability numbers, bore hole locations and historical data. Along the bottom of the graph the bore holes are numbered from 20 to 18. The vertical line measures the retrogression distance potential. The black dots on the graft are the maximum stability numbers (Ns) obtained at the particular bore hole site. For example, at bore hole 3 the Ns is above 6 putting that particular slope into a potential flow situation. It should be noted that the distinction that accompanies a particular Ns number is that at the lower number the potential is simple, rotational. In the medium number the potential is retrogression and in the upper level from 6 up the potential is retrogression and earth flow. So that for simple rotational potential you need a Ns of between 3 and 4. For potential retrogression you need an Ns between 4 and 6 and for a retrogression and earth flow potential you need an Ns above 6.

Morey confirmed that the photos, Exhibit A, probably depicted a retrogression and earth flow situation.

Mr. Morey conceded that the entire 20 kilometer study area is subject to retrogression landslides and therefore dangerous but pointed out that the study area can be broken into areas where the area is more subject to retrogressive landslides than other areas.

Morey mentioned that one of the 4 slides in the vicinity of the subject property occurred in about 1850. He believes he was told this by the Conservation Authority.

Returning to figure 24 of his report, Tab 15, Morey explained that the dotted lines show the linear meters of landslide per kilometer of riverbank and the solid lines show the retrogressive distance up the slope in meters. On the right hand side of the graph the distance in meters for both measurements is given in thousands of meters. The graph indicates that no landslides occurred between bore hole 20 to a point between bore holes 1 and 3. The landslides become quite concentrated beginning just before bore hole 12. The subject property is bracketed by bore hole 21 and bore hole 1 where the stability numbers (Ns) are approximately 3.3 and 5.2 respectively.

Morey explained that one can take Ns numbers throughout the bore hole as one goes down with the bore and can then average them out. However, in his calculations he has used the highest stability number (Ns) recorded for his analysis. He did not agree with Mr. Rasmussen that there was a professional school of thought that it was appropriate to use the average as opposed to the highest. He explained further that he uses the highest stability number (Ns) obtained between the ground level and the underside of the slope to river level. If the highest Ns occurs below water level then he must use his judgment to determine whether it should be used.

At Tab 23, Exhibit 4, Golder's November 1988 report page 148, is the bore hole log for bore hole 88-1. Morey confirmed that this is the log for the bore hole placed on the plaintiff's property in September of 1988.

Rasmussen then referred Morey to his report of September 1988 at Tab 15, page 17, and particularly the last paragraph which reads as follows:

> The possible landslide retrogression distances for each site investigated was estimated based on several empirical methods which are illustrated graphically in figures 20, 21, 22, and 23 (methods A, B and C) and a fourth represented by the equation R=(Ns-4)100 (method D) which has been previously discussed. (R=(Ns-4)100 is the Mitchell formula.) The estimated retrogression distances based on these methods are shown in table 5. Also provided in table 5 are the distances of some of the previous landslide retrogressions measured from the air photos of the study area.
> It is evident from table 5 that the estimated retrogression distance based on the four methods vary by up to a factor of almost four ...

Morey conceded that depending on the choice of method, one can obtain dramatically different results. He conceded as well that nothing in geo-tech engineering is precise and that different engineers use different methods.

It should be noted that the report at page 18 goes on to say the following:

> ... In comparison of the estimated retrogressive distance at each site with the historical data, method A consistently provides a safe estimate of retrogressive landslide distances. Method B is inconsistent with the historical data and method D gives estimated retrogression distances which generally underestimates the historical information. Method C provides only a general indication of retrogression distances or retrogressive tendency.

At Table V of Morey's report of September 1988 retrogressive distances are estimated at each of the bore hole sites using each of the four methods. The table then compares those results with the historical data. One can co-relate Table V to Exhibit 5 which is the site plan of the river. It should be noted that at bore hole sites 20 and 21 there had been no landslide and therefore no historical data. Therefore under the heading HISTORICAL DATA for those two bore hole sites the term NA is used. Table V indicates that the historical data is based on the greatest retrogressive distance of a major landslide within 1 kilometer of the bore hole and NA indicates that there was no major retrogressive landslide within 1 kilometer of a bore hole. Morey explained that with respect to bore hole 1 / 2 in determining historical data he would not have had the stability number Ns at slide site A so would have used the stability number at bore hole 1 or 3.

Table V would indicate that the use of Mitchell's formula underestimated the retrogressive distances he would have expected to find. He conceded that this conclusion is based on an assumed value of Ns used at the landslide sites.

Filed as Exhibit B was the report of R.J. Mitchell with respect to flow sliding and sensitive soils. Table 1 of the report identifies a number of earth flows. Numbers 34 and 35 are the 1910 and 1971 slides on the South Nation River respectively. If one goes through Exhibit 5, the site plan of the river, those slides are H and I respectively. Table 3 in the Mitchell report gives the stability number (Ns) for each of the slides and the retrogression distances. Mitchell uses an Ns number of 9.0 for the 1910 slide and computes a retrogression distance of 1,000 feet. Mitchell uses a Ns number of 10.0 for the 1971 slide and computes a retrogression distance of 1,600 feet. Rasmussen was trying to make the point that it all depends on the Ns number used when one says that the Mitchell formula understated the historical data.

Rasmussen pointed out that in looking at Table V it is apparent that in some instances the Mitchell formula actually overstates the historical data and sometimes, eg at bore hole 3, is right on in terms of compatibility of the estimated retrogressive distance by his formula and the actual retrogressive distance measured by historical data.

Morey pointed out that in all cases, in estimating the retrogressive distance with method D, he used his own Ns.

At Tab 23 is Morey's report to the plaintiff dated November 1988. The bore hole on the property had been sunk in September and Morey was on the site October 18 and 19. Exhibit 6 is figure 3 to that report which at page 5 states the following:

> ... The toe area slope is in an active state of erosion and evidence of previous slope toe area failure and superficial sloughing is extensive. Based on the general undulating ground surface within the mid slope terrace it is expected that this portion of the riverbank has experienced previous retrogressive slope failing.

Morey in his evidence confirmed that that was his opinion. He felt that there had been retrogressive landslide there to a small extent. In his view the retrogression had ended at the beginning of the terrace as shown on Exhibit 6. It should be noted as I have recorded on Exhibit 6 that the length of the toe on the subject land is approximately 18 meters from river's edge to the beginning of the terrace, as I have marked it on Exhibit 6. The terrace runs from a point approximately 18 meters from the river's edge to a point 45 meters from the river where the slope begins.

Having regard to what he thought to be previous retrogressive slope failure on the subject land, Morey confirmed that for retrogression one needs initial toe failure at which time the backscarp fails and keeps failing until (1) it reaches a gully (2) the strength of the backscarp is able to support itself or (3) the river can't take any more of the back scarp. Morey conceded to Rasmussen that in this case the slide only went back to the beginning of the terrace and stopped at that point but slides can stop at a point and then later continue on. It was his evidence that that was exactly what happened in the 1993 slide at Lemieux where it had stopped at one time in the past and then in 1993 continued on. In other words and by way of example, continuing erosion could cause further retrogression after it had stopped in the past without the stability number Ns changing. In his view that is what happened at Lemieux.

It was Morey's evidence that the highest stability number determined above the river level on the subject property in the bore hole was 5.9 at a depth of about 1 foot. He felt that this would be representative of the entire site for a reasonable distance into adjoining property.

Morey explained that in applying the Mitchell formula and using the highest stability number above the river level at 5.9, one gets a retrogressive distance of 190 meters from the edge of the riverbank. Morey explained that the Mitchell equation is R=(Ns-4)100. Morey used the formula R=(Ns-4)180. Rasmussen put it to him that he wanted to overestimate rather than underestimate the retrogressive distance. Morey responded that he took all of the data and came up with a formula to make sure that he would determine the maximum retrogressive distance one might expect in the event that there was a failure.

Morey confirmed that he took no physical measurements of distance from the river to the gully on the plaintiff's property. At Tab 23 his report to the plaintiff of November 1988 at page 156 is a site plan which was given to him by the plaintiff which has certain measurements on it, one of which is 1156 feet from the back of the propose new theatre down to the crest of the river slope.

At page 143 of the report beginning at the top, the following is noted:

> Detailed stability analyses have not been carried out to determine exactly the appropriate remedial measures required to stabilize the riverbank, however, based on previous slope stability analysis carried out within the general area of the site, it is considered that flattening of the slope toe area at the river

> edge to an inclination of 3 horizontal to 1 vertical, together with some upper slope flattening and providing erosion protection using armour stone rip rap and geotextile in the lower portion and mulch and seeding for the upper portion should be sufficient. The length of riverbank along which the remedial work should be carried out depends on the actual location of the proposed building and the distance between the proposed building and the riverbank. Once the desired location for the proposed building has been chosen, the extent and details of the riverbank remedial works can be determined.

Morey did not agree with Mr. Rasmussen that it was absolutely necessary to put a bore hole into the toe to know the factor of safety of the toe. He was satisfied that notwithstanding that detailed stability analysis had not been carried out to determine exactly the appropriate remedial measures required to stabilize the riverbank, he was satisfied that if one carried out the remedial work referred to at page 143 of his report across the face of the property, that would protect the property from retrogressive landslides, subject to a determination as to how far one would have to go on either side of the property with the remedial work.

Morey then brought to light that his report to the plaintiff was made in anticipation of the building being located 300 meters from the shoreline. See page 134 of Tab 23. All of Morey's recommendations were made in the face of that anticipation. The alternative was to place the building south of the gully. He explained further that the work suggested was to prevent initial failure of the riverbank so that one would not have to worry about the retrogressive distance. He explained that if the site is outside the potential retrogressive distance then one does not have to be concerned about whether or not there is an initial failure. Further, if there is no assurance of no initial failure and one is inside the retrogressive distance, then one can rely on the gully. Again he explained that the gully was within the computed retrogressive distance.

Morey confirmed to Mr. Rasmussen that in effect what he had said to the plaintiff was to either do the remedial work or put the building to the south of the extended gully. Morey had no doubt that Lamadeleine had a perfect understanding of the advice being given to him. As it turned out, Lamadeleine did not do the remedial work and put the building on the north side of the gully.

Referencing Tab 25, a letter from Morey to Lamadeleine dated December 28, 1988, Morey confirmed that he visited the site on October 19, 1988 and again on November 23, 1988. The second paragraph of the letter reads as follows:

> With regard to the remedial works carried out at this site, the results of the inspection on November 23, 1988 indicated that the existing ravine had been sufficiently extended and deepened to provide adequate protection against the possibility of a landslide for a building located on the south side of the ravine and east of the west extent of the ravine.

Morey confirmed that the remedial work referred to in this letter was the extension of the gully in a westerly direction. Lamadeleine had asked him to return to the site on November 23, 1988 to ensure that the extension of the gully was okay, which it was. Lamadeleine indicated to Morey that the building would be located south of the gully. Morey is unable to say whether or not he discussed with Lamadeleine the dangers of retrogressive landslides.

At Tab 34 is a letter from Morey to Lamadeleine dated April 21, 1989 which is strikingly similar to the letter dated December 28, 1988 at Tab 25. The letter purports to provide clarification of the inspection of the work carried out at the site to protect the proposed Sucrerie theatre building from possible landslide retrogression. Morey was unable to offer any explanation as to why Lamadeleine required clarification of the letter of December 28, 1988. It is interesting to note that the letter of December 28, 1988 refers specifically to the building being located on the south side of the ravine while the letter of April 21, 1989 does not specifically locate the building on the south side of the ravine. In any event, Morey confirmed that he would never have suggested to Lamadeleine that he put the building on the north side of the gully without the other remedial work being done.

Referring to the meeting on site with several other people earlier referred to by Morey in his evidence, Morey confirmed that the purpose of that meeting was to take a look at the river and to see whether the remedial work carried out by Lamadeleine was satisfactory. It was obvious to everybody that what Lamadeleine had done on the slope was not remedial work and was totally inadequate. It is likely that Morey mentioned that to somebody during the course of the meeting. Certainly at that meeting no one suggested that because of the work Lamadeleine had done on the slope the building could be sited north of the ravine. Again he confirmed that the work that he observed done by Lamadeleine on that day did noting to stabilize the bank. The work had been done on the terrace and was not in conformity with Morey's recommendations as previously discussed. Morey

has no recollection whether he discussed the remedial work with Lamadeleine, that is the remedial work set out at the Tab 23 report, page 11. He does recall that he discussed liquidity index with him and the susceptibility of the slope to flowing.

Apparently the building burned in 1990. Rasmussen indicated to Morey on cross that we would hear that before the new permit was issued to rebuild the municipality required Lamadeleine to get a geo-tech opinion that it was safe to build north of the gully. Rasmussen asked Morey if Lamadeleine had ever come to him asking for an opinion that it was safe to build north of the gully. Morey testified that he had not and if he had he would not have given such an opinion without the remedial work set out at page 11 of his November 1988 report being done.

Cross-Examination by Mr. Marcus

Mr. Marcus inquired of Morey whether he had assumed that the distance from the river to the proposed building site as indicated on figure 2 at page 156 of Tab 23 was correct. Morey replied that he had air photos with which he could have determined distance to the proposed site and he is unable to say whether or not he did make that determination. The distance marked on the site plan at page 156 of Tab 23 is 1156 feet from the crest of the slope to the front of the proposed site for the new theatre. On this site plan during the course of his cross-examination by Mr. Marcus, Morey marked the location of the ravine such that it placed the proposed site for the new theatre to the south of the ravine. Morey also confirmed that the site plan at page 156 of Tab 23 is the very plan given to him by Lamadeleine except for the printed notation at the bottom "Golder Associates" which was placed there by him. It perhaps should be noted that 1156 feet equals 352 metres.

Morey again confirmed that he was absolutely positive that Lamadeleine understood that in order for the building to be protected after the remedial work on the ravine, it had to be located south of the ravine.

Re-Examination by Mr. Leamen

Morey confirmed for Mr. Leamen that the distance of 1156 feet indicated on the site plan, page 156 of Tab 23, is not relevant because it runs parallel to the lot line rather than to the closest point on the river.

Referring to Exhibit B, the Mitchell Report, Morey pointed out that in his formula for retrogressive distance, the distance is taken from the shoreline whereas Mitchell at page 17, figure 3 of his report, measures retrogressive distance from the crest of the slope back to the extent of the retrogression.

At any point on the river the approximate distance from shoreline to crest is 180 to 300 feet. The result of all this is, as Morey put it, that one would have to add to the retrogressive distances computed by Mitchell to align them with Morey's results. He explained that from his knowledge of actual slides, the retrogressive distances of these slides went beyond Mitchell's calculation. That is why it is important to include all the data with respect to previous retrogressive slides in the formula as Morey did.

Finally, Morey explained that all slides begin the same. There is the initial failure and then slices or a series of slices fall off. If the slide goes further, then it gets into earth flow with extrusions occurring and slices falling into the extrusion. The stability number (Ns) of 4 to 6 produces slices. A stability number of 6 or more brings on the extrusion process.

Next Witness: Gordon McRostie

Examination-in-Chief

Filed as Exhibit 8 was Mr. McRostie's CV. He received his Engineering Degree from the University of Toronto (Honours) in 1944 and has practiced actively as an engineer since that time. His field of expertise has been in geo-technical engineering and he has had a particular interest in retrogressive landslides during the entire course of his career. His involvement with retrogressive landslides from 1955 to present is set out in his CV.

Mr. McRostie has visited the plaintiff's property on three occasions. His report dated January 9, 1997 is at Tab 129 of Exhibit 4. He was initially retained by the plaintiff's solicitors to made a geo-technical study and to reply to two questions:

1. Is the present theatre building on the property safe; and
2. If the building is not safe, what remedial work is required to make it safe?

In preparing his report he reviewed the Golder report of November 1988, the Patterson report of November 22, 1990, the Whitford report of October 31, 1990. As well, he reviewed a report prepared for Golder

Associates by Doctors Bozozuke and Law of the National Research Council dated February 11, 1992. McRostie also reviewed the published papers on the South Nation River retrogressive slides and several other technical papers as listed on pages 4 and 5 of his report. He spoke with Morey and reviewed with him his reports to the Conservation Authority. He spoke with Professor R. Mitchel at Queens University who was the originator of the model of estimating retrogression distance.

With that background, McRostie visited the site on January 6, 1997 and conducted a detailed site inspection .8 kilometers upstream and downstream of the site. He made the following observations:

(a) the most critical slope for the theatre building is actually on the adjacent neighbour's land to the east. McRostie located his most critical slope on Exhibit 2 with a red arrow. In his view, this was the most critical slope for the theatre building because it is the part of the riverbank closest to the building and because it has a steeper slope than that located on the plaintiff's property;

(b) a small landslide scar exists on the west bank of the first gully east of the plaintiff's property indicating continuing instability of the lower riverbank slopes;

(c) evidence exists of continuing creep type movements in the lower third of the river slopes examined. This evidence is from bends in the trunks of trees near the ground indicating movements first tilting the trees, then trees returning to vertical as they continued to grow.

As a result of his site inspection, McRostie after meeting with his partner St. Louis and his senior associate Morrissette who are both experienced in landslide study, reached the following conclusions:

1. There is a fairly broad-based group of opinions among the experts in the specialty of geo-technical engineering that the risk of an initial landslide continuing as a retrogressive slide can be estimated. The methods for estimation need to recognize at least 4 factors; namely, stability number, liquidity index, sensitivity and undrained sheer strength.
2. The Golder/Morey report dated November 1988 on the plaintiff's site outlined their method which included a recognition of the above-noted 4 factors and McRostie is in agreement with Morey's conclusion that the site is at risk of having a retrogressive landslide if an initial slide begins.
3. There is less general agreement among the experts regarding the ability to predict the distance to which an initial slide will continue to retrogress. It is noted that Professor Mitchell offers the caution that engineers should not expect too high an accuracy in their predictions given the fundamental uncertainties in the natural soil deposits and their analysis. Professor Lefebvre (who will be testifying at this trial) in his 1996 state of the art chapter, warned that "The potential distance of retrogression is difficult to evaluate".
4. It was Morey's opinion that his studies over the past 10 years are very definitive and that the 1993 Lemieux slide confirmed Morey's model and his calculation methods.
5. The distance of retrogression is still not capable of highly accurate prediction however McRostie is of the opinion that Morey's recommendation in their 1988 report of a retrogression distance of 340 meters is a reasonable set back distance to be used at this site.

McRostie, in his evidence, noted that Morey's retrogression distance of 340 meters was measured from the river edge whereas Mitchell's retrogressive distances are measured from the crest. In McRostie's opinion the two methods (Morey v. Mitchell) are based on different assumptions and result in measurements that may differ by 50 to 100 meters. McRostie noted that Morey's distance of 340 meters was measured perpendicular to the river which results in the shortest distance. It appears that the building was located 170 meters from the river and therefore was within the retrogressive distance.

McRostie reached the following conclusions and made the following recommendations:

1. With respect to question 1, it is his opinion that the theatre building is not safe at certain times of certain years. An initial landslide which could trigger a retrogressive landslide involving the building is most likely to occur only during the Spring or early Summer months when rapid snow melt and early rains cause exceptionally high ground water conditions in the slope. Some years are more critical than others when all the unfavourable weather factors happen to occur together.
2. With respect to question 2 an adequate remedial work

program to prevent retrogression of an initial slide back to the building is possible by excavating a new deep cut off gully between the building and the river on the owner's land and on neighbours land. The cut off gully would, however, be costly, at least $500,000., would destroy the existing mature sugar bush, and would have environmental problems in disposing of the excavated soil. Another possible remedial work program would be aimed at preventing any initial slides at the riverbank. This would require the construction of a large rock fill toe berm on the bottom third of the slope. The rock fill berm would likely be even more costly than a new cut off gully and would create new environmental problems plus possibly some obstruction of the river channel. A third possible remedial work would be to flatten the entire slope and hence prevent an initial slide. This would involve even more costs plus loss of the entire sugar bush and is not a reasonable alternative to consider. Finally, an experimental method of increasing the existing slope stability and hence preventing an initial slide has been attempted at a few sights by installing a large number of vertical pore pressure lowering drains. This is an attractive solution since no disruption of existing conditions would result however the method has been tried at a few locations in east Canada and has not had reliable success and cannot be recommended at this time.

At Tab 132 is a letter to McRostie from the plaintiff's solicitor confirming certain discussions. At Tab 134 is McRostie's letter in return acknowledging that the solicitor's record of their discussions is accurate. In effect, then, McRostie confirmed the following:

1. There is a combination of weather elements (heavy thaw and heavy precipitation in late Winter and early Spring) which could lead to a slide;
2. The property immediately adjacent to Mr. Lamadeleines is one where such a slide could well occur;
3. If such a slide were to occur, it would almost certainly retrogress;
4. Although there is no precise modelling that can be done to determine the extent of retrogression, McRostie is comfortable with the 340 meter set back limit suggested by Morey on the understanding that the gully immediately
5. If asked specifically whether the theatre building would be safe in the face of such a retrogressive slide, McRostie indicated that it would not be.

Subsequently, McRostie was retained to prepare a further report which report is at Tab 142 and is dated December 14, 1998. The terms of reference for this report were as follows. McRostie was requested to continue the geo-technical studies reported on January 9, 1997. The continued studies were to include a review of the statements made during the examinations for discovery of Stephen J. Walker (John D. Paterson and Associates Ltd.) and Raymond Hache (Jacques Whitford Limited), on August 12, 1998. The study was to identify the most critical riverbank slope which could cause an initial landslide effecting the theatre building, to analyze the stability of this most critical slope, to give an opinion on the risk of retrogression, to give an opinion on the geo-technical professions standards of investigation in 1990 and to comment on whether the two 1990 reports by the two firms mentioned above met those standards.

In preparing this second report, McRostie reviewed the Jacques Whitford report of October 31, 1990 (Tab 72), the preliminary report of John D. Paterson and Associates Ltd. dated November 19, 1990 (Tab 75) and the full John D. Paterson report dated November 22, 1990 (Tab 79). As well, McRostie reviewed the Jacques Whitford letter to the plaintiff dated November 22, 1990 at Tab 80.

In preparing this second report McRostie felt that one of the most important factors to consider was public safety. There have been about 545 deaths due to landslides in the years between 1840 and 1996 and 98 of these deaths have been due to landslides in the sensitive clays of Eastern Canada. Landslides can kill and that fact effects McRostie's judgment. He is of the view that in matters such as these a conservative approach is required. To tolerate any safety factor less than 1.5 is not a conservative approach.

In McRostie's view there were two reasons why the plaintiff's property and building posed a special public safety risk. The theatre is a place of public assembly and the sucrerie is attractive to groups of people at the time of Spring snow melt conditions which is the period of highest landslide risk since ground water levels are often at their highest points of the entire year during early Spring months.

To identify the most critical riverbank slope in connection with the theatre building, McRostie examined the riverbank slopes across the full width of the plaintiff's property and also for about 1,000 meters both upstream and downstream. The most critical slope that could effect the plaintiff's property is almost directly opposite the theatre building on a line drawn at right angles to the riverbank through the theatre building.

The shortest distance from the riverbank to the theatre building is approximately 170 meters. That distance takes in the building itself. There appears to have been some confusion in the 1990 reports by the defendants regarding how this critical distance should be measured. The Paterson report in section 1.0 on page 2 states that "the site is located approximately 340 meters from the crest of the slope". The Jacques Whitford report states in section 6.1 on page 7 that "the stability condition of the Nation River located approximately 350 meters north of the proposed restaurant is not of concern". In McRostie's view then, it would appear that both these reports misunderstood the principles involved in identifying the most critical slope.

Here the closest spot to the river and the critical slope happened to coincide and if a retrogressive landslide occurred at this point it would certainly involve the plaintiff's building. The plaintiff's property shoreline is not relevant because it is not the closest and steepest.

It would also appear that the Paterson studies were mistaken in estimating the steepness of the slopes since the answer given by Walker to question 368 in his examination for discovery was "in this particular case the highest and steepest slopes were on Mr. Lamadeleine's property.

At pages 6 and 7 of McRostie's report dated December 14, 1998 there is an analysis of the most critical slope which indicates the following.

In analyzing the stability of riverbank slopes to consider whether an initial slide is likely, which in turn could retrogress and effect a site considerably further from the river, there are two groups of assumptions that must be made. The first is the soil strength parameters and the second is the ground water levels and ground water flow conditions. Soil strength parameters recommended in a broadly based study by Poschmann et al published in 1983 have been consistently used in all of the studies made to date including McRostie's studies.

Assumptions of the applicable ground water conditions are more variable and more complex since they vary with the season and the years. The Paterson studies of 1990 made the conservative assumption of a fully saturated slope with horizontal flow of ground water (Ru=0.6). Using the above assumptions they calculated a factor of safety of about 1.4 for the slope on the plaintiff's property which they chose to analyze. If they had identified the slope which McRostie felt was the most critical, and used those same assumptions, they would have calculated a factor of safety of 1.09 which would have been, in McRostie's opinion, a totally unacceptable margin of safety.

In calculating his factor of safety, McRostie assumed a situation where maximum flood levels had been caused on the South Nation River by ice jams in the river and that when the ice jam breaks, the flood level drops dramatically in a few hours. This would create a "rapid draw down" condition in the lower portion of the critical slope and to recognize this McRostie felt that a horizontal ground water flow in the lowest 8 meters of the slope is required. With these assumptions, McRostie's calculated factor of safety for the critical slope is 1.19 which again is unacceptable.

Even using a less conservative assumption, neglecting the ice jam and rapid draw down scenario, and assuming ground water flow parallel to the slope for its full height, the calculated factor of safety is 1.24 which is still unacceptable.

In McRostie's view, when the results using all 3 ground water assumptions outlined above are reviewed ranging from 1.09 to 1.24, none of the assumptions gives calculated factors of safety near the value of 1.5 which, in McRostie's view, is a reasonable requirement in assessing the risk of an initial or "trigger" slide at the riverbank. In his opinion, there is therefore an unacceptable risk of the occurrence of the initial slide at the riverbank opposite the Lamadeleine theatre building.

With respect to the question whether or not the initial riverbank failure would retrogress, in McRostie's view, this is best answered by air photos which any competent engineer would review in studies such as these. McRostie pointed to Exhibit 2, the site air photo, which was contained in Golder's report to the plaintiff at Tab 23. McRostie identified in the immediate vicinity of the plaintiff's property, three landslide scars which, as he puts it, presents a very serious warning with respect to the potential for a retrogressive landslide. The three identified include the two on the far side of the river previously identified by Morey and a third on the plaintiff's side of the river located to the west of his property which I have marked on my Exhibit 2. McRostie pointed out that the biggest scar of the three is the one directly across the river from the plaintiff's property and is large enough that it would, if it occurred on the plaintiff's side of the river,

take in all of the plaintiff's property north of the gully. It should be noted that McRostie marked on Exhibit 2 the third scar located on the plaintiff's side of the river to the west of the property. As well, see figure 4 to McRostie's report at Tab 142 which again identifies the three past retrogressive landslides in the fairly immediate area.

Based on some information available from the Conservation Authority, it appears that at least one of the three slides occurred within human memory (a few hundred years). In McRostie's view, if there is no evidence to the contrary, then for the purposes of studies such as these one should assume that the slides occurred in recent times.

McRostie noted that there were several other Golder studies made over the period 1988/1989 mostly for the South Nation River Valley Conservation Authority. These studies documented and analyzed many other retrogressive slides in the area of similar geological background.

From all of the foregoing, it is McRostie's opinion that in 1990 there was clear evidence that an initial riverbank slide at or near the subject property should be expected to retrogress some hundreds of meters back from the original slope crest.

It should be noted that there is a theory proposed by Dr. Daniel Lagarec that initial slope failures would not retrogress into parts of the flat upper lands that are covered by trees. Dr. Lagarec's theory is not generally accepted by geo-technical engineers. McRostie has studied air photos of several retrogressive landslides and observed masses of trees in the slide debris indicating that treed zones had been included in the failed areas. Interestingly there is a record in the Quebec Gazette, April 6, 1840, reporting a landslide on the Maskinonge River where workers in a sugar bush had to flee to escape a retrogressive landslide which advanced through the sugar bush despite the presence of many trees. Again, interestingly enough, Professor Lefebvre whom I understand will testify for the defence, has expressed the opinion that even dense tree growth has not been and could not be expected to retard or stop the progression of a retrogressive landslide into adjacent upper level lands. Professor Mitchell has expressed the same opinion.

It is therefore McRostie's opinion that retrogression would almost certainly follow an initial landslide at the riverbank at the critical slope opposite the plaintiff's theatre site.

With respect to the distance of retrogression, McRostie maintains the opinion expressed in his initial report and that is that the distance of retrogression is not capable of highly accurate prediction but that the Golder/Morey recommendation in their 1988 report to the plaintiff of a retrogression distance of 340 meters is a reasonable set back distance to be used at this site. There is no doubt in his mind that the retrogression distance at the site would be greatly in excess of the 170 meter distance which separates the theatre building from the riverbank. He concludes, therefore, that at certain times of years the theatre building is at risk of being destroyed by retrogressive landslide.

At page 14 of his report McRostie, in discussing the standards of the profession in 1990, expresses the view that a geo-technical investigation of the possibility of landslide effecting a building site adjacent to a riverbank slope would have, in 1990, contained the following activities:

1. Review of existing air photos for one or more kilometers up and downstream from the site to look for past landslide areas;
2. Review of any published reports on landslides in the area;
3. Review of any site specific landslide risk reports for the site being studied or sites less than a kilometer distance on the riverbank;
4. Personal inspection of the site and the adjacent riverbank slopes for at least 500 meters upstream and downstream to establish the most critical slope location with particular attention to be paid to the slope at the zone closest to the subject site measured at right angles to the riverbank;
5. A review of the possible consequences of a landslide failure;
6. Items 4 and 5 would be made by a geo-technical engineer with experience in landslide studies since judgment of the critical slope, the most likely critical slope inclinations, the possible seasonable ground water fluctuations, the consequences of an initial slope failure and the risk of a retrogressive failure developing to threaten the site at some distance back from the river, are all aspects requiring engineering judgment rather than a technician;
7. The risk of an initial or trigger slide developing into a retrogressive landslide would require special study;
8. That study would include a visual estimate of the steepness of all slopes close to the site. Any slopes with an inclination steeper than about 15 degrees and a height more than 10 meters would be surveyed using a

clinometer and tape or survey level and tape. Evidence of Spring flood levels would be examined and recorded. The calculated factor of safety for the most critical slopes would then be obtained for a range of possible ground water flow assumptions and a set of reasonable soil property assumptions. A desirable factor of safety resulting from these calculations would then be judged with a suitable margin of safety included which would recognize the limitations of the analysis methods and assumptions plus the consequence of a failure;

9. If the critical riverbank slopes were judged not to have an adequate margin of safety, then the next two aspects would be studied namely the risk of retrogression and possible retrogression distance. The main evidence to be considered here would be evidence of past landslide shown by past failure scars on air photos;
10. After reaching a conclusion that a critical initial riverbank slide is possible and also that retrogression is possible, then a study of retrogression distance is needed. Under this heading McRostie expressed the view that the landmark publication giving a method of calculating retrogression distance by R.J. Mitchell in 1978 is still applicable but he points out that the Mitchell method and the Morey method are not actually that far apart when one considers the different points of measurement, eg, shoreline v. crest.

In critiquing the Paterson report McRostie made the following observations:

1. The Paterson report does not appear to recognize the evidence of past retrogressive slides which can be seen in air photos. He understands that the Golder report dated November 1988 to the plaintiff was made available to Paterson and it contains an air photo clearly showing past retrogressive landslide scars.
2. The Paterson report does not appear to recognize the site specific information in the same Golder report which showed in figure 3 an existing riverbank slope with an estimated factor of safety below 1.5 and likely close to 1.0;
3. The Paterson report was not based on site inspections by an experienced geo-technical engineer;
4. The Paterson report does not appear to have considered
5. The Paterson report does not appear to have selected the appropriate most critical riverbank slope which could cause an initial landslide;
6. The Paterson report did not consider the theatre site to be at risk from a retrogressive slide chiefly due to the fact that it failed to select the appropriate most critical riverbank slope. McRostie points out as well that the Paterson report also states that the theatre site is approximately 340 meters from the riverbank. This distance is incorrectly measured parallel to the property center line rather than at the closest distance perpendicular to the riverbank which is 170 meters.

In his critique of the Jacques Whitford report (J/W) McRostie makes the following comments:

1. The J/W report does not appear to recognize the evidence of past retrogressive landslides as seen in the air photos;
2. The J/W report does not appear to have considered the public safety risks;
3. The J/W report and later studies do not appear to have been based on an adequate on site examination of the possible most critical slopes. Examination of riverbank slopes only along the river front of the plaintiff's parcel together with a visual examination "as far as the eye could see" through a wooded zone does not meet the standards outlined in his report;
4. The J/W report does not appear to have been based on thorough study of whether an initial slide could retrogress. There appears to have been an unquestioning reliance on the theory presented by Dr. Lagarec as part of their reassurance that retrogression of an initial slide would not occur;
5. The J/W report does not appear to have considered the possible distance to which retrogression might have extended however the report does state that the theatre site is located approximately 340 meters north of the Nation River. McRostie points out that in a letter to the plaintiff dated November 22, 1990 the distance is corrected to "some 200 meters north". There was also the statement that "the possibility of a retrogressive failure at that site (the critical slope east of Lamadeleine's property) has not been investigated". The end result of the November 22,

1990 letter in McRostie's opinion would be to give moderate encouragement to proceed with building at the site. The risks were presented as being indefinite and low when in fact in McRostie's opinion the risks were and still are very real and possibly catastrophic.

McRostie was aware that the Paterson people had sunk a bore hole. McRostie applied the Mitchell formula to Paterson's bore hole data which included a maximum Ns of 7.8 at a depth of 11 meters. Using the Mitchell formula with that Ns resulted in a retrogressive distance of 380 meters from the crest which is the result Paterson should have obtained. That distance of course includes all the land north of the gully.

In critiquing Dr. Lefebvre's report, which we will see in due course, McRostie made the following comments:

1. Lefebvre refers to the distance given by the client of 1128 feet. McRostie notes that as a general principle, engineers do not accept anyone else's measurements of location. This is typical of the professions standard of care;
2. While Lefebvre is an eminently qualified engineer, he makes no mention of certain facts such as:

   (a) neither Paterson or Jacques Whitford made use of air photos which was a glaring omission;
   (b) he was misled. He states that the Paterson report contains no plan and that Paterson had no evidence as to where the building was to be. This was not so. If one looks at the Paterson report at Tab 79, the last page, there is a plot plan setting out the location of the proposed building. The plan itself is erroneous. It notes the scale to be 1 to 1000 whereas it should be 1 to 3000. It appears that Paterson took the plan and redrew it and, in doing so, made an error with respect to the scale. As well it appears he drew the gully in an incorrect location on the plan;
   (c) Dr. Lefebvre's comment with respect to the difference in retrogressive distances was made with the lack of awareness that Mitchell's distances were from the crest and Morey's from the shore;
   (d) he made no comment on Patersons and Jacques Whitford's lack of concern for public safety;
   (e) Dr. Lefebvre has done outstanding work in the field of downward pore pressure. McRostie explained that as over the course of the centuries the river erodes its course through the clay, it eventually gets down to more impervious clay so that the pore pressure then runs down rather than out, leaving the slope more stable. That is not a factor in this case when one looks at past recent slides which occurred when the riverbed was at the same depth as it is now. McRostie is of the view that with respect to these most recent slides the run off must have overpowered the downward flow.
   (f) Dr. Lefebvre made no comment about the fact that both Paterson and Jacques Whitford incorrectly measured the distance from the building to the riverbank.

McRostie concluded his evidence on the afternoon of June 7th by suggesting in answer to a question that I put to him that the Morey report did not find a critical slope because the nature of the report was not detailed enough to require it. He suggested that Paterson and Jacques Whitford simply did not look. The next day, June 8th, in concluding his examination-in-chief, McRostie was asked to look at figures 2 and 4 of Morey's report at Tab 54. That is the report to Gore & Story dated August 1989. They are not actually contained at Tab 54 and accordingly figure 2 is entered as Exhibit 9 and figure 4 was entered as Exhibit 10. He was asked once again by Mr. Leamen as to whether or not Morey had, in his report, identified the critical slope. He replied that Morey had reviewed the available air photographs as required to do so. He also examined the published information with respect to slides in the area to establish that slides do occur in the area. He understood the concept of shortest distance. Perhaps most importantly the bore hole that was sunk by Morey was on the line of the shortest distance to the river. See Tab 23, page 156 of Morey's report to Lamadeleine which is the site plan of the plaintiff's property showing the location of the bore hole. Finally, Exhibit 6 is Morey's slope profile of the critical slope so that in the final analysis he did identify what he saw to be the most critical slope which is marked on Exhibit 6 as the existing slope surface at bore hole #1. Finally, Morey carried on to calculate the retro distance.

Cross-Examination of McRostie
by Rasmussen

McRostie was first engaged by Allan Cohen on behalf of the plaintiff during the first week of January 1997 and McRostie made his first visit to the site during that week. He was retained by Cohen to answer two questions.

1. Was the site safe; and
2. If not, what remedial work was required?

He was asked by Rasmussen as to what had prompted the retainer and the questions. McRostie replied that he must have, at the time, heard about the OMB hearing which was coming up but he cannot recall whether there was a discussion concerning whether his work would be used at the OMB hearing. He does not recall understanding what the OMB hearing was to be about.

Rasmussen suggested to him that the hearing before the municipal Board was with respect to a dispute as to where the line should be drawn to define the hazard zone. McRostie had no recollection of that. He did recall that the plaintiff was unhappy with the two studies prepared by Paterson and Jacques Whitford. The plaintiff wanted to know whether the conclusions of those studies were correct and, if not, whether the plaintiff might lose his building. McRostie was aware that the plaintiff had gotten a building permit on the basis of at least those two studies.

McRostie denied that his study was performed in order to support the hazard line being re-drawn. He conceded, however, that his study could probably be used for that purpose.

McRostie's first report to Mr. Cohen was dated January 9, 1997 and is located at Tab 129. He conceded to Mr. Rasmussen that since at least the mid 1980's any geo-tech engineer from Ottawa would know that the stretch of the river from Lemieux to Cardinal was subjected to landslides. McRostie testified that the three most significant slides are the two across the river from the plaintiff and one on the same side of the river as the plaintiff but to the east of his property. McRostie testified that if Paterson and Jacques Whitford had looked at the three landslides they should have acted on their observations. It would have been reasonable for them to state that they had looked at these landslides. They did not, in their reports, say that they had and even if they had looked, they failed to use the information available to them from these landslides.

McRostie confirmed that in preparing his study he would have had all of the Golder reports prepared by Morey and he would have used them for a site specific investigation at the plaintiff's site. He knew Morey had been working in that area and actually telephoned Morey.

At the bottom of page 5 of McRostie's report dated January 9, 1997 at Tab 129 the following is said:

> The detailed method of calculating retrogression distance was examined and checked and found to contain no errors, but a minor difference of opinion existed on whether maximum values of Ns or average values of Ns were more logical. The Golder method of using maximum Ns values was, however, consistent and was calibrated by comparison at about 20 past slides.

Rasmussen suggested to McRostie that he had used average Ns values. McRostie denied this. He conceded that he knew other engineers that used average Ns values in doing the computations but most engineers he testified used maximum values as does Mitchell.

At page 6 of the report McRostie, in reviewing his discussions with Mitchell at Queens University who was the originator of the model or method of estimating retrogression distance, says the following of Mitchell:

> He cautioned that the close agreement of the Golder Morey method at the 1993 Lemieux slide was possibly fortuitous and that engineers should not expect too high an accuracy in their predictions, given the fundamental uncertainties in the natural soil deposits and their analysis.

McRostie conceded that Professor Mitchell was aware of the possibility of inaccuracy.

Again referring to page 6 of the report, when McRostie identifies the most critical slope as being on the adjacent neighbour's land to the east, he testified that he identified that slope because it was the steepest and not the highest.

At Section 3.5.3 McRostie identifies evidence of continuing creep type movements in the lower third of the river slopes examined. He testified that it was difficult to identify the extent of the creep by the reference to Exhibit 6. He was unable to say whether it extended to the terrace area that I have marked on Exhibit 6. He was unable to recall whether he saw evidence of

creep all along the bank or only at the steepest slope. He explained that his practice is to walk the area to find the steepest slope and then examine that steepest slope in detail.

Rasmussen referred McRostie to his conclusions 3.6.1, 3.6.2 and 3.6.3 where he is in agreement with the Golder conclusion that the site is at risk of having a retrogressive landslide if an initial slide begins. Rasmussen suggested to McRostie that he had not done any factor of safety calculations for any of these particular slopes at the time that he expressed his opinion. McRostie replied that he had examined the reports of the site but conceded that he did not do any bore holes or specific calculations at that time. He did, however, do such calculations later in 1999 in his second report.

Rasmussen asked McRostie what there was in any of the reports that he had seen that related to this critical slope which showed a calculation of a factor of safety. McRostie replied that the Morey Golder report of 1988 to Gore & Story, Tab 54, had made the comparison that he had referred to in his evidence this day showing a factor of safety less than the one of 1.4.

Referring to Exhibit 10 which is figure 4 to the Golder report at Tab 54, McRostie identified slope 2A1 as the most critical slope. There are 2 slopes shown adjacent to the plaintiff's property; 2A1-1 on the plaintiff's property and 2A1 further to the east. Rasmussen then entered Exhibit 11 which are some calculations that he found in McRostie's file and McRostie identified these calculations as being an assessment of the slope at 2A1. McRostie "thought" that Exhibit 11 was an assessment of the slope at 2A1. The designation at the top of his calculations is "re slope 2A-1" but in fact there is no slope shown with that designation on Exhibit 10.

McRostie's second report dated December 14, 1998 is at Tab 142. Rasmussen pointed out that approximately 4 pages from the back was marked plate #1 which appears to be a portion of Exhibit 10 which shows the location of lines 2A1 and 2A1-1 and the location of McRostie's surveyed cross section which is located between 2A1-1 and 2A1. The approximate location of the surveyed cross section is designated by a thick dark line located between 2A1-1 and 2A1 and McRostie confirmed that that was the location of the survey and that was where he identified the most critical slope, which evidence tends to clear up his previous evidence.

Admitted as Exhibit 12 then was plate #2 to McRostie's second report dated December 14, 1998 which is a cross section surveyed by him on October 28, 1998. It shows the information that came from the survey performed at the point indicated on plate #1.

Returning to Exhibit 11 McRostie identified his associate, one Luc Morrissette, as the person whose handwriting was on the first page. The writing says in part "Using Paterson's parameters we obtained a factor of safety of a minimum of 1.12". McRostie confirmed that on the second page is the actual calculation that was used to get the factor of safety of 1.2.

With this in mind Rasmussen indicated to McRostie that he wished to discuss the matter further because McRostie had mentioned two different factors of safety that were calculated and neither one of the them was 1.12. He directed McRostie to Tab 142, his report to Soloway, Wright, dated December 14, 1998, the second report. At page 7 there is one calculation of a factor of safety for the critical slope at 1.19 assuming ice jams, creating flood levels, the ice jam breaking, and resulting in a "rapid draw down" condition in the lower portion of the critical slope and assuming, in order to recognize this contingency, a horizontal ground water flow in the lowest 8 meters of the slope. In the last paragraph of page 7 it is noted that an even less conservative assumption neglecting the ice jam and rapid draw down scenario and assuming ground water flow parallel to the slope for its full height, the factor of safety at the critical slope using this unconservative assumption which McRostie would not consider reasonable, would result in a factor of safety of 1.24. At page 6 of the report McRostie notes in the penultimate paragraph that if Paterson had identified the most critical slope and used certain assumptions they would have calculated a factor of safety of 1.09 which would have been, in his opinion, a totally unacceptable margin of safety. Rasmussen asked McRostie where the calculations were that were used to get to these numbers of 1.09, 1.19 and 1.024. McRostie replied that he would expect they were in the file. Rasmussen indicated that he had not found them. He also advised McRostie that why he wanted the calculations was to see what assumptions were being made to arrive at those numbers.

McRostie replied that the soil strength parameter assumptions were all the same. They were restricted in the amount of laboratory study that they could do and the parameters set out on Exhibit 12 would be the soil strength parameters used. The only variable would be the ground water flow assumptions. If one compares the calculations in Exhibit 11 to Exhibit 12, the cross section surveyed on October 28, 1998, the soil strength parameters are indeed identical. When one looks at the ground water conditions assumed in Exhibit 12 with an Ru=0.6 (Ru is the pore pressure assumption) one sees that the factor of safety varies from 1.09 through to 1.19 to 1.24

depending on whether one assumes a horizontal flow of water throughout the entire height of the slope, a flow parallel to the slope in the upper part and horizontal flow in the lower 8 meters or a flow parallel to the slope for its full height.

McRostie confirmed to Rasmussen that in all of the calculations that he did, no one took into account any underflow drainage. McRostie explained that underflow drainage was not taken into account because there was a possibility during the Spring floods that the long term downgrade would be overcome by temporary higher ground water which means more severe ground water conditions in the Spring flood. Rasmussen invited McRostie to agree that if he could be convinced that underflow drainage would not be effected by a sudden rise in the river and an equally sudden draw down in the river, the assumption would make the calculation of the factor of safety change. McRostie responded that it was not only river flood it was also the Spring snow melt which causes saturation in the upper parts of the slope that must be considered. McRostie did concede that it was the pore pressure in the lower areas of the slope that is most critical and that if in fact there was continuous underflow drainage the factor of safety calculation would reveal a higher number. He explained that the factor of safety is a comparison of calculated resistance compared with calculated strength.

Rasmussen suggested that once the factor of safety value is determined, then observations in the field should have some effect on the ultimate opinion that the engineer comes to as to whether or not one is going to get a toe failure. He suggested that observations with respect to movement in the slope, whether it's the point of the river where the current strikes so as to have heavy erosion, and the nature of the material that is on the slope itself would all factor into it. McRostie expressed the opinion that those observations would have very little to do with it.

McRostie agreed that the river has existed in more or less its current form for thousands of years since the glacier retreated and that what we are concerned about here is the likelihood of the toe of the slope failing and the land sliding into the river. Rasmussen asked the question what could happen that would change the stability of this toe of this slope to make it act differently that it has for the last ten thousand years. McRostie replied that weather factors are one of the changes that might effect it and during the last ten thousand years the river has eroded the banks. He conceded that there is a theory, to which he subscribes, that in these types of clays as the riverbank deepens through erosion it can have the effect of making them more stable because you get to the point where you do have underflow drainage and it reduces the pore pressure in the banks. He conceded that for this stretch of river as a result of the passage of time, it has probably increased the stability of these banks as opposed to decreasing it except to the extent that there's been active erosion by the flow of the water.

Rasmussen then had a discussion with McRostie about stability numbers, Ns, the factor that gets calculated based upon the properties in the soil. Rasmussen reminded McRostie that the day before he gave evidence that the raw data from the Paterson bore hole led to a stability number of 7.8 which in turn would result in a retrogressive distance using the Mitchell formula of 380 meters. McRostie agreed that he had so testified. McRostie agreed that there was something known as a "field vane sheer strength" which can be determined by taking an implement that is perhaps a foot long, pushing it into the soil and then rotating it. McRostie agreed that there were also vane sheer measurements that could be calculated in the laboratory with samples that have been taken in shelby tubes. McRostie did not agree that one would get two totally different results in this type of soil material depending on which method was used. When that suggestion was put to him he said, "We hope not". Rasmussen suggested that there was a difference in doing sheer strength results in disturbed soil and undisturbed soil to which McRostie responded that it is hoped that the samples are relatively undisturbed.

McRostie confirmed that three bore holes had been put down on the site; one by Golder, one by Whitford and one by Paterson and that the Paterson and Jacques Whitford bore holes were very close together. Part of the work which McRostie's forces did in the preparation of his report was to review the Golder information in respect of their bore hole data. Filed as Exhibit 13 was a sheet of calculations that came out of McRostie's file. It is titled Example - Check on Ns Profile in BH88.1. It is dated January 6, 1997. Below the heading it notes "Average Basis (not what Morey used)". McRostie conceded that that was his handwriting and that he probably did these calculations after he went to see Mr. Morey. He indicated that the calculations in the upper part of the page would appear to be average calculations and those below would be maximum calculations. Rasmussen suggested to the witness that what he has done here is take the data that is recorded on the bore holes for 10 meters, 15 meters, 20 meters and 22 meters and having taken that data, calculated the Ns number. McRostie agreed that it appeared that way. Rasmussen suggested that he hadn't done any averaging at all when he came to those numbers because there's only one piece of data recorded for each level. At Tab 23 Golder's report to Lamadeleine dated November 1988, page 148 is the bore hole record for bore hole 88-1. McRostie confirmed from Exhibit 13 that he has recorded that at 14 meters with a CU of 42 kilopascals, the Ns is 5.2. Rasmussen suggested to McRostie that he was drawing a differentiation between 14 and

15 meters which McRostie responded that he thought he was averaging the CU values.

Continuing with the discussion, McRostie confirmed that he did a calculation of maximum Ns at 4.7. Then down at the bottom of the right hand corner there is a notation maximum Ns as used by Morey 5.2.

Rasmussen pointed out to McRostie that Morey had indicated a maximum Ns of 5.9. McRostie could not, by looking at the data out of the Golder report, determine how Golder got to 5.9. McRostie confirmed that in his calculation, Exhibit 13, on the lower left hand side he notes that if one uses an Ns of 4.7 and the Morey formula, one gets a retro distance of 126 meters and if one uses an Ns of 5.2 and the Mitchell formula, one gets 120 meters. McRostie confirmed in his evidence that his conclusion at that time was that on the basis of that bore hole information using either Morey or Mitchell formula, the most one comes up with is a retro distance of 126 meters. Rasmussen asked McRostie whether he had redone the calculation since that time and McRostie said he thought he had. Rasmussen pointed out to him that he had not seen any further calculation in the file.

Rasmussen confirmed with McRostie that he also had information from the report of Jacques Whitford. He put the following question to McRostie:

> The information from the Golder bore hole and the Jacques Whitford bore hole is totally different from what you drew from the Paterson report because on Golder it's 4.7, 5.2, or maximum 5.9 and on your review of it the highest was 5.2. I'll give you a chance to confirm this but on the Jacques Whitford information the maximum there could be is 5.3 and yet you people concluded that the stability number from a bore hole taken very close to the Jacques Whitford one was 7.8. Doesn't something seen wrong?

McRostie replied that his conclusion was that the Paterson report using its own information would have come to the 7.8 number. Rasmussen suggested to McRostie that if the Paterson report specifically says that the sheer strengths were laboratory determined vane strengths that should immediately indicate to him that they can't be compared to the field vane sheer strength that were determined. McRostie did not agree. He persisted in his view that if Paterson had looked at his own results he should have recognized that this was a warning.

Rasmussen suggested to McRostie that with all the information he had available no one could have concluded an Ns as high as he had and nor could anyone conclude that there would be a retrogressive distance of 380 meters. McRostie replied that if one looked at the air photos one can easily get that information. Rasmussen persisted and suggested that there was no Ns information on the site that anyone could rely upon that would lead to McRostie's conclusions. McRostie responded that the air photo is much more important. He said "All these formulas are imaginations to attempt to analyze the real situation. If you look at the landslide scar directly across from this property and you look at its distance, it would .. and you put it on the other side of the river, take all the way back to the gully and that's a very serious warning." [what McRostie did during this evidence was demonstrate with the length of his thumb that if you measure the extent to which the slide extended on the other side of the river from the plaintiff, if there was a retrogressive landslide on the plaintiff's side of the river, that same distance would engulf all his land right back to the gully.] McRostie persisted in his view that had Paterson used his own data he would have gotten a retro distance of 380 meters.

Rasmussen referred McRostie to page 13 of his report under the heading "Is the Theatre Building at Risk" and particularly the last two lines on that page which read as follows:

> Therefore I must still conclude that at certain times of certain years the theatre building is at risk of being destroyed by a retrogressive landslide.

He conceded to Rasmussen that he arrived at that conclusion because of the Spring run off and the potential high water in the river. He conceded that if one could eliminate the effects of those two, his opinion would be that this theatre site is not at risk provided preventative works were undertaken at the riverbank to make sure that the riverbank did not change. He conceded that the preventative works at the riverbank would prevent erosion and also the rock berm adds to the stability of the slope or at least the weight of the rock berm does.

McRostie conceded that there are some times during other years when the building would not be at risk and that its at risk at certain years at certain times because of the Spring run off and the formation of ice dams plus the snow melt in the upper areas of the slope. In an answer to my question he explained that the risk occurs when the Spring run off and the snow melting and flowing down the slope occur simultaneously or within a very short period of time. When you get an unfortunate combination, say

once every several decades, of a maximum snow melt condition where you've had a heavy snow and a late Spring and the weather turns warm and there's a rapid melting of the snow, this saturates the upper part of the slope and at the same time if the river has been suffering an ice jam and the ice jam breaks and the water flows away suddenly, it is these random circumstances occurring at the same time that would cause a landslide to most likely occur. McRostie conceded to Rasmussen that in the absence of those conditions his opinion is that the site is not at risk of a retrogressive landslide. He said in answer to that suggestion "Yes. At this moment, for example, I don't think the risk is great."

Again, in answer to my question, McRostie explained that for there to be a real risk of a landslide one needed three factors to occur together:

1. snow melt;
2. Spring rain; and
3. rapid draw down in the river level as a result of an ice dam breaking.

He conceded to Rasmussen that over the last ten thousand years since the withdrawal of the glaciers we have had those conditions, if indeed they are ever going to exist, and that there has not been a retrogressive landslide that has engulfed this site but certainly one that has engulfed the site across the river. Rasmussen asked why our subject site did not fail at the same time as the site across the river if those conditions existed. McRostie explained that the snow accumulation can be different, the vegetation can be different thus affecting the infiltration rate.

McRostie was referred to Tab 72, the Jacques Whitford report to the plaintiff dated October 31, 1990. McRostie confirmed that it was one of the reports that he reviewed. Paragraph 3 of the report sets out the scope of the work as follows:

(a) to investigate the soil conditions at the proposed site by carrying out a field and laboratory study;
(b) to survey the gully immediately adjacent to the proposed site in order to determine slope stability conditions; and
(c) to provide geo-technical recommendations for the design and construction of the proposed structure.

At Tab 80 is Jacques Whitford's letter to the plaintiff dated November 22, 1990 and introduced as Exhibit 14 is a copy of the first page of that letter that was extracted from McRostie's file. In McRostie's handwriting at the top of Exhibit 14 is the notation "Conrad claims he did not receive this "warning" letter". A further notation is that "It was sent (copy) to the Township of Cambridge".

Filed as Exhibit 15 is a page of notes from McRostie's file in his handwriting. His note is to the effect that Whitford's letter of November 22nd constitutes a retraction of their approval of the building location north of the gully and that Paul Leamen will have to settle the question whether this lets the defendant Jacques Whitford off their responsibility for their opposite opinion in their October 31, 1990 report. In his exchange with Rasmussen, McRostie would not concede that he felt this was a retraction of their approval, but rather only a weakening of their opinion.

Filed as Exhibit 16 was another copy of the November 20, 1990 letter to Lamadeleine from Jacques Whitford. It has a note on it "Sent out but revised after".

Exhibit 17 is a page of the November 20th letter. McRostie has no recollection of having seen it and it was his evidence that Lamadeleine never told him that he had made changes to it.

Rasmussen suggested to McRostie that given his opinion that there was a retraction or watering down of Whitford's opinion by reason of the letter of November 22, 1990 (Exhibit 14) it would be very unlikely that the Township would issue the building permit. McRostie responded that the letter was ambivalent. He pointed by way of example to paragraph 3 at page 2 which notes that the riverbank conditions immediately east of the site are rather different, that a possibility of a retrogressive failure at that site has not been investigated and that a failure at this site could possibly jeopardize a portion of the present site. The letter goes on to point out, however, that it is also noted that a ravine is present between the proposed restaurant and the east property line and that a ravine such as the existing one may act as a potential barrier of retrogressive failure. The letter then goes on to say that provided that the existing site conditions are unaltered, the risk of a retrogressive failure jeopardizing the proposed restaurant is very low. McRostie persisted in his position that he did not feel that this was a retraction of any endorsement that had been made previously of that site.

Rasmussen, referring to the words in the letter of retraction "Provided that the existing site conditions are unaltered" suggested that that really was saying that so long as nothing changes on this site, there's no erosion, no one starts to construct something new on it other than this theatre at that

site, so long as the existing conditions are unaltered, the risk of retrogressive failure jeopardizing the proposed restaurant is very low and he suggested to McRostie that if one disregards the three factors discussed with him and His Honour a short while ago, Spring melt, heavy rain and the ice dam phenomena, Jacques Whitford was saying exactly the same thing as he, McRostie, was saying, that is, so long as the site remains unaltered, there shouldn't be any risk of a retrogressive landslide engulfing the site. McRostie, I thought quite craftily replied that was exactly the risk. His words were "Yes, but that's exactly the risk. We know that those combinations of circumstances have occurred and will occur again and that's when the risk is there".

McRostie agreed with the penultimate paragraph on page 3 of the letter of November 22 "Should the conditions of the riverbank (such as erosion etc.) change in the future the overall stability of the site should be assessed at that time. Remedial measures may be required accordingly. Presently removal of vegetation should not be carried out anywhere within the property."

At Tab 79 is the Paterson report. At page 2 it is noted that samples of clay recovered in shelby tubes were sealed air tight, protected from disturbance and subsequently transported to their laboratory for test purposes. At page 2 it is noted that the laboratory vane sheer strength was determined from the samples of clay recovered in the shelby tubes processed in their laboratory. At the bottom of page 2 under the heading "Stability Analysis" it is noted that prior to Paterson undertaking their numerical analysis of the stability of the clay slopes a complete review of the available information was conducted by the firm. It is noted that in addition to the site specific works conducted by Golder Associates, a regional study had been conducted by the Ministry and their findings were reported in Ontario Geological Survey Miscellaneous Paper 112 entitled "Slope Stability Study of the South Nation River and Portions of the Ottawa River." In that report the particular section of slope is identified as having a factor of safety to the order of 1.2 to 1.5 which would indicate that the slopes have marginal stability. Paterson notes that a specific slope cross section was analyzed using the SB slope computer program and the cross sections attached to the report. Paterson's calculations at page 3 indicate that the factor of safety against an initial rotational failure occurring is in the order of 1.4 which is considered to represent a marginally stable slope condition and notes that this analysis was conducted using excessively high pore water pressure conditions that are likely never to develop in the slope. Finally, Paterson expresses the conclusion that the slopes bordering the South Nation River at this particular site are not in their present condition, considered to be unstable. They also express the opinion that should a failure of the banks occur, it would not retrogress back to the location of the proposed building. McRostie agreed that using excessively high pore water pressure conditions which is essentially assuming a horizontal flow for the whole slope is a very conservative approach but the analysis does not relate to the most critical slope. Rasmussen tried to point out that the site plan attached to the Paterson report at the end of that report of which McRostie is so critical is identical to the plan attached to the Golder report but McRostie would not agree. Rasmussen suggested that if Paterson was given the Golder report at Tab 23 that had the site plan that appears at page 156 of that Tab, it was reasonable for him to feel that he could rely upon that information. McRostie responded that in critical areas such as the determination of the distance to the river he would want to do his own measurements and not rely on others.

Cross-Examination by Marcus

It was brought out that in the Ottawa area there are only about 7 firms that do this kind of work.

Next Witness: Allan Cohen

Examination-in-Chief

Mr. Cohen is a partner in the law firm of Soloway, Wright and has been for the last 25 years. His practice has specialized in municipal, planning, development and environmental law. He was consulted by the plaintiff toward the end of 1996. He learned that the plaintiff had acquired property adjacent to the South Nation River and was concerned about designation and zoning placing the land in a hazard area notwithstanding the plaintiff's belief that its location was not dangerous. The plaintiff wanted Mr. Cohen to put it right. Mr. Cohen was aware of the pending official plan amendment 51 and the zoning by-law 25/95.

At Tab 92 is the draft amendment 51 to the official plan of the Corporation of the Township of Cambridge. At Tab 98 is by-law 25-95.

The plaintiff retained Mr. Cohen to make representations at the upcoming OMB hearing to support a line drawn such that it excluded the plaintiff's land from the hazard area. To that end Mr. Cohen went about gathering information and making an assessment of the situation.

By the time Mr. Cohen was retained, a pre-hearing conference had already been conducted by the OMB. That is standard practice in cases that will take two weeks or more and which are complicated.

At Tab 114 is Mr. Cohen's letter to the OMB asking for a copy of the Board's order arising out of the pre-hearing conference. In the letter Mr. Cohen points out that his client operates a theatre on lands within the Township which are the subject of the "Complaint" by the South Nation River Conservation Authority which, although not an appellant, has apparently sought party status to seek an amendment or a modification to the map sheet attached to by-law 25-95. At Tab 113 is the memorandum of pre-hearing conference and order of the Board.

The plaintiff advised Mr. Cohen that there had been a fire on his property in 1990 and that he had retained consultants to assist in obtaining a building permit to reconstruct. Mr. Cohen wrote letters to the South Nation River Conservation Authority, the Municipality and the two Consultants seeking information. His letter to the Authority is at Tab 115. In writing to the Authority he appreciated that the Authority was responsible under the legislation for reviewing activity around the river and assumed that the Authority would be involved in the issuance of building permits. He noted in his letter that the Authority has asked to be designated by the OMB as a party to the hearing which at that point was scheduled for sometime in February. The letter is dated October 22, 1996. Again in the letter Mr. Cohen points out to the Authority that he understands the previous studies were performed on his client's site by Jacques Whitford, Paterson and Lagerec and that their reports were apparently not satisfactory to the Authority.

At Tab 116 is a letter from the Municipality to Mr. Lamadeleine dated October 23, 1996 which points out to Mr. Lamadeleine that it is important for him to engage a hydro-geologist to find out about the status of his land. Mr. Cohen was aware that the question was whether the plaintiff's building was safe having regard to the possibility of a retrogressive slide. More particularly the question was might such a slide occur and, if so, what distance would it travel. Mr. Cohen's retainer was to support the Township in the appeal by the Authority against the line as it was then drawn. (Which at that time excluded the plaintiff's land)

At Tab 117 is a letter from Ault and Ault, solicitors for the Authority. The letter points out in reply to Mr. Cohen's previous letter that there were four site specific geo-technical evaluations conducted for the plaintiff's land as opposed to the three mentioned in Mr. Cohen's letter, the fourth one being the study conducted by Golder Associates in 1988 which Ault and Ault points out gave recommendations for remedial work that the Authority would have found acceptable had those recommendations been followed. Ault's letter also points out that the Paterson report states that the theatre building is located 340 meters from the water course and it is suggested that this is an adequate set back if a retrogressive potential exists. Ault points out that 340 meters may or may not be an adequate set back but that is academic because in fact the theatre building is located 170 meters from the South Nation River when measured perpendicular to the water course and that there is no indication that 170 meters is an adequate set back. The letter points out that Dr. Lagarec is not a qualified geo-tech engineer and in any event did not examine adjacent properties. Ault points out that clearly Mother Nature does not recognize property boundaries and according to the Golder report the retrogressive problem for the theatre building rests primarily with the property immediately upstream of the theatre property (to the east). The letter then sets out criteria that would be acceptable to the Authority when investigating unstable slopes with retrogressive potential.

Mr. Cohen pointed out that the hazard line had been altered between the time the Authority saw the by-law for the first time and the date of the hearing before the OMB. That is why the Authority had applied for status as a party. The line originally included the plaintiff's property when the Authority first saw the by-law but by this point in time the line had been changed, placed in front of the property and thus excluded the property from the hazard area.

At Tab 119 is Cohen's letter to Jacques Whitford. He wrote a similar letter to Paterson. At Tab 122 is Paterson's letter to Mr. Cohen in reply dated December 20, 1996. In this letter Paterson stands by its original report in accordance with the terms of reference at that time. He points out that at the time they had determined that the factor of safety against initial rotational failure was in the order of 1.4 which is considered to represent a marginally stable slope condition. The letter points out that Paterson has been advised by the authority that there has been an initial slide on the banks and points out that the fact that it has not retrogressed back to the building is confirmation of Paterson's analysis. The letter states, however, that it is the plaintiff's responsibility to prevent further erosion of the toe to prevent further slippage. The letter points out that at no time was Paterson asked to provide input into the location of a set back line for the site. Its report was used by the plaintiff to get a building permit for his building and the Township gave their blessing by issuing a building permit. The letter points out that the issue at hand is the fact that there is an official plan amendment being proposed which shows the set back line at the crest of the

slope which is completely anomalous to the surrounding lands. With the line situated at the crest it gives the land owner unlimited freedom for future development and the letter points out that in Paterson's discussion with the Authority it was inferred that the problem is not so much with the location of the building but rather the location of the set back line. The letter points out that if the line had been situated a reasonable distance back from the crest, the issue would probably never would have come to light. Finally, the letter takes the position that the problem that the plaintiff is left with is a planning issue.

At Tab 123 is a letter from Mr. Rasmussen to Mr. Cohen on behalf of Jacques Whitford Limited. Mr. Rasmussen suggests in his letter that the prudent thing for the plaintiff to do would be to develop expert evidence necessary to establish that the position held by the Authority cannot succeed and suggests that should the plaintiff elect not to contest the OMB hearing vigorously Jacques Whitford Limited would take the position that the plaintiff has failed to properly protect his position or to mitigate any potential loss.

Cohen decided then to retain an expert to review the Morey, Paterson and Whitford reports.

At Tab 125 is Cohen's letter to Paterson putting the simple question, is the building safe and inquiring whether or not they had reviewed the Morey report which called for a set back of 340 meters from the river.

At Tab 126 is Cohen's letter to Rasmussen dated January 3, 1997 which points out that Whitford does not appear to be prepared to state that it stands behind its study.

At Tab 127 is a letter from the Authority to Mr. Cohen which points out that based on the geo-technical evidence available to the Authority, it is the position of the Authority that the study area line adopted by the Township of Cambridge Council does not accurately reflect the potential hazard. The study area line is set out in map schedules provided with the official plan amendment and zoning changes. The Authority points out that the official plan is written in such a way that one can build within the hazard zone if a geo-technical expert says that with respect to a specific site there either is no problem or if there is a problem, remedial work will solve the problem.

At Tab 128 is a letter from the Authority to the OMB, a copy of which was received by Mr. Cohen.

At Tab 129 is the McRostie report received by Cohen. The report told Cohen that:

1. the plaintiff's property was in an area where a slide could occur. The slide would occur more likely to the immediate east;
2. the slide would retrogress to the plaintiff's building; and
3. the plaintiff's building was not safe.

In the face of this report and in the face of the Golder report, Cohen decided that it would not be wise to go to the OMB to defend the present location of the hazard line which excluded the plaintiff's property in that all he had to oppose McRostie and Golder were the reports of the other two consultants. Cohen advised the plaintiff to consult with his insurer and further advised him against using the property for any reason. He saw no point in fighting the relocation of the hazard line by the OMB for the following reasons.

1. The OMB had from the Authority a detached expert who would testify with respect to a model that the Authority was treating as accurate and Cohen did not think that the OMB would reject that model and accept the Paterson and Whitford models.
2. McRostie, in his report, had declared the building unsafe.
3. Cohen felt that even if he could convince the OMB that the new line was the correct one, then that would put the plaintiff's building in what Cohen knew from all of the evidence to be a hazard zone and Cohen would, in fact, be responsible for the lives of as many as 2500 people and he refused to do that.

[It is obvious that Cohen had to judge this matter for himself and in the face of conflicting evidence and conflicting opinions, had come to the conclusion that contrary to Paterson and Jacques Whitford's position, the building was not in a safe location.]

At Tab 132 is a letter from Cohen to McRostie that we have already seen confirming that the building was not safe. At Tab 134 is McRostie's reply which we have already seen. At

Tab 135 are Cohen's letters to both Paterson and Whitford.

At Tab 140 is a copy of the OMB's decision. Cohen pointed out that the plaintiff agreed with him that there was no point in fighting the issue before the OMB however it had been agreed that the Township would call Paterson and Whitford at the OMB hearing to defend the new line which excluded the plaintiff's property. Cohen and the plaintiff attended the OMB hearing but did not seek party status which would have given them the right to cross-examine, call evidence, argue and render themselves susceptible to costs. They did have status as a participant who could come and go and with the Board's permission, ask questions. However, they had no right to argue. Cohen and the plaintiff did not want to be before the Board for two weeks as would be required of a party and did not want to argue or be responsible for costs.

The OMB hearing was, from Cohen's point of view, very unusual. Initially the Board had an in-camera meeting with the solicitors for the Authority and the Township. The Board then reopened and land use planning evidence was called. There was then another in-camera meeting with counsel for the Authority and the Township. The Board then reopened and said that it did not need to hear geo-technical evidence and that this was a planning problem only, that the hazard line was not correct and the Authority had the power to relocate the line and the line was relocated. In its Reasons the Board points out the following. Sometime between mid August and mid September 1996 the plaintiff came to see the municipality's consultant planner, Mr. Miguelez, and asked him to make the line on his property less restrictive or closer to the river. The plaintiff based the request on two studies that had been done for him; the Paterson report and the Jacques-Whitford report. It was Mr. Miguelez's evidence that the plaintiff assured him that the Authority had reviewed the reports and was in agreement with them. Miguelez reviewed the reports, concluded that they were geo-technical investigations as foreseen in the OPA51 policy and redrew the line on the Lamadeleine property based on his interpretation of the reports. He did not contact the Authority but rather relied on the plaintiff's statement that the Authority was satisfied. It was this less restrictive line that formed part of OPA51 and by-law 25-95 when adopted by council. In May or June 1996 the Authority became aware of the change when they were approached for a clearance certificate on the property. The Authority became a party to this hearing because it took the position that the less restrictive line did not adequately reflect the landslide potential on the plaintiff's property. Mr. Miguelez was very clear that had he known the Authority was not satisfied with the Paterson and Jacques-Whitford reports he would not have moved the line.

Cross-Examination by Rasmussen

Mr. Cohen had been provided by the plaintiff with a copy of the Golder report which he reviewed. Cohen had been left with the impression by the plaintiff that the plaintiff had done the remedial work suggested by Morey and that Morey thought the site was safe after that remedial work was completed. The plaintiff thought that he had done the remedial work in accordance with Morey's recommendations however after speaking to Morey, Mr. Cohen understood that the remedial work had not been done as required by Morey and to the extent required by Morey and then was not satisfied that the building was safe. McRostie then confirmed that the building was not safe.

At Tab 110 is a letter from Janet Bradley to the municipality dated June 18, 1996 written on behalf of the plaintiff and expressing the same concerns.

Mr. Cohen confirmed for Mr. Rasmussen his understanding of the fact that set backs were established as early as 1982. The first set backs established were 600 meters from the shoreline on the left shore as one goes down stream and 800 feet on the right shore. Cohen understood that the fact that the plaintiff was in a hazard zone had been established for some time before the plaintiff retained Mr. Cohen. Then the Golder report proposed a set back that was adopted by the Township and which gave rise to the OPA and the by-law approved by the Township. Cohen agreed that the plaintiff then went to the Township planner, showed him the Paterson and Jacques-Whitford reports and the planner moved the line with respect to the plaintiff's property although Cohen indicated in his evidence that it is not the planner that relocates the line, it was the Township that relocated the line relying on the advice of its planner. Cohen pointed out as well that the plaintiff obviously was upset that the line was initially drawn so as to include his land after he had gotten two consultant's reports and after having obtained the building permit.

Cohen agreed that the whole concept of the hazard line was to identify the area that had potential for retrogressive landslides. He also recognized that even if a particular site was in the hazard zone, the site could be developed and built on in the face of a site specific report.

Rasmussen suggested to Cohen that it was Paterson's position that it had not been asked to determine an appropriate study zone but rather had been asked whether it was appropriate to put a specific building on a specific site. Cohen, I think quite properly, replied that he did not know how one could

do one without the other. Cohen was of the view that the third paragraph in Paterson's letter of reply to Cohen dated December 20, 1996 which points out that at no time was Paterson asked to provide input into the location of a set back line for the site, completely avoided the questions which were:

(a) was a retrogressive slide likely to occur? and
(b) if so, how far would it travel?

As far as Cohen was concerned, only when those questions are answered can one say the building is safe.

With respect to Tab 140, the OMB report at page 10, paragraph 3, the Board says it is satisfied that the municipality was fully prepared to defend its by-law including the less restrictive line on the plaintiff's property. The Board finds, however, that the information from Mr. Lamadeleine was the central reason the line was moved and therefore the main reason for any issue between the municipality and the Authority. The Board notes that Mr. Lamadeleine had every opportunity to present his views and that to hear the geo-technical evidence would be an unnecessary and costly diversion and that the planning framework established by OBA51 and by-law 25-95 represent good planning and that the more restrictive line on the Lamadeleine property represents good planning in the absence of adequate site specific reports. Cohen testified that the Board misunderstood its function. The Township was entitled to defend the appeal brought by the Authority and the Board was wrong in not calling the geo-technical evidence and in redrawing the line without hearing that evidence.

Rasmussen pointed out to Cohen the first paragraph on page 4 of the Decision of the OMB which reads as follows:

> The intent of the landslide potential area is to require appropriate studies not to prohibit development outright. There is, therefore, no policy need to change the demarcation of the area on an on-going basis. As well, I am not satisfied that a study area policy line should be moved based on site specific geo-technical studies. Such studies are generally designed to test whether a particular structure or other development can be built without risk. They are by their nature specific to time, place and structure. They are not designed to show that no other development ever would be at risk and that no study is needed for a future unknown development and time.

Cross-Examination by Marcus

Cohen was not aware exactly what Lamadeleine had told Miguelez with respect to approval from the Authority. Cohen did know that Lamadeleine went to Miguelez with the Paterson and Jacques-Whitford reports and that he thought the Authority had approved the reports otherwise he would not have received a building permit to reconstruct in 1990. Cohen pointed out that the Authority was only a phone call away and Miguelez should have called the Authority to confirm that they approved the two reports. As a result, the line was relocated by counsel because the planner represented to council the relocation of the line without calling the Authority to confirm that the Authority was satisfied.

Evidence of Conrad Lamadeleine

Examination-in-Chief

Mr. Lamadeleine is the owner of the plaintiff numbered company which in turn owns the subject lands which were purchased in 1982. Mr. Lamadeleine has been in the business of investment and insurance brokerage since 1961. He was the reeve of Casselman for some 13 years until approximately 2 years ago. He also served on the Conservation Authority from 1992 to 1994.

The property purchased in 1982 consisted of 28 acres adjacent to the South Nation River containing a sugar bush. Upon purchase he repaired the maple syrup shed in the bush and started up the sugar bush operation which became a success as there were no other sugar bushes within 60 miles. It was his evidence that on some Sundays they served as many as 1100 meals and during the week a total of 700 to 800 meals beginning at the end of February, early March and lasting until the end of April or beginning of May. Some 2400 mature maple trees were being tapped.

In 1988 the local economic development director suggested that the plaintiff consider establishing a summer theatre in English and French. The existing buildings were not adequate for a theatre. The plaintiff considered constructing a new building which would be a combination theatre and restaurant, perhaps 60 feet wide by 80 feet long with a 12 foot ceiling designed to accommodate 300 people. After discussions with the Township of Cambridge, it was suggested that perhaps to begin with the plaintiff should make modifications to an existing building and try the theatre operation for a year. If a new building was to be constructed the plaintiff intended to place it south of he ravine next to the parking lot, primarily to place it closer to the parking lot to assist disabled persons to access the theatre. The existing building which the plaintiff decided to renovate was

located on the north side of the ravine. The plan was to extend the width of that building by some 20 feet along its entire length and adjust its interior height to accommodate 200 patrons.

Mr. Lamadeleine showed the location of the proposed new theatre on Exhibit 1 with a circled X located to the south of the ravine and confirmed that the building that they planned to renovate for a theatre use on a temporary basis was located to the north of the ravine.

At Tab 8 is a letter from MNR dated November 10, 1987 addressed to Mr. Lamadeleine and referring to certain concerns that Mr. Lamadeleine had. Mr. Lamadeleine explained in his evidence that the concerns that he had expressed were that between Casselman and Lemieux there were always landslides or rumours of landslides. The MNR in this letter simply directed Mr. Lamadeleine to the Township. He did discuss the concerns with the Township who said that certain studies were underway.

At Tab 9 is a letter from the MNR to Mr. Lamadeleine dated December 14, 1987 again in response to his concerns. The MNR, with this letter, encloses a map outlining the known earth flow failures near the plaintiff's property and those are the 2 across the river and the 1 on the same side of the river which we have seen several times now. MNR indicates that these failures have been identified as occurring in the 1800s, that there have been some 18 large failures in all and 3 of them have occurred in the last 95 years.

At Tab 11 is a letter from the Ministry to the Township dated January 4, 1988 referencing the plaintiff's land. The plaintiff received a copy of that letter. The letter pointed out that the plaintiff's property was partially within the earth flow zone and should be subject to the earth flow restrictions outlined in Section 6.26 of the draft comprehensive by-law. It was Mr. Lamadeleine's evidence that he understood that the portion of his property that was within the earth flow zone was the northwest portion, north of the dotted line on the map attached to the Ministry's letter dated December 14, 1987 at Tab 9.

At Tab 14 is a letter from the Ministry dated August 31, 1988 confirming a visit by the Ministry to the summer theatre/sugar bush. The letter notes that most of the sugar bush and the site of the proposed new theatre was inside the set back line. It was Mr. Lamadeleine's evidence that the proposed site at that time was south of the ravine.

Around this time the plaintiff knew of Golder. The Authority had told the plaintiff that Morey was doing studies in the area with respect to landslides. Lamadeleine did not become aware of the Golder report to the Authority dated September 1988 until about 1992.

At Tab 18 is a letter from the Ministry to Lamadeleine dated September 19, 1988 confirming that Lamadeleine is retaining Morey at his own expense to conduct geo-technical testing and assessment of the landslide hazard for the stretch of river slope likely to have an effect on his property at lot 17. Lamadeleine in his evidence explained that the municipality had said there was danger along the river and that he was partially in the earth flow zone and should get a geo-technical survey and in particular get Morey to do the survey. As a result, Lamadeleine agreed to do so. In effect the municipality was requiring that before he put up any building he had to have soil tests conducted and so he had no choice. As well, he agreed to do it because he had a concern for the safety of the patrons coming to the site as he did for his own family. As I understood Lamadeleine's evidence most of these discussions with the municipality about geo-technical surveys were with respect to his proposal to build a new building.

At Tab 19 is documentation with respect to the minor variance application that was required to permit the plaintiff to add 20 feet to the existing building north of the ravine to be used as a sugar bush camp and summer theatre. The application was approved.

At Tab 20 is Morey's letter of October 20, 1988 to Mr. Lamadeleine. Lamadeleine testified that he had retained Morey to find out if the land was safe to put up a new building for a theatre to be located south of the gully. He told Morey that he wanted to extend the parking and put up a new building to the south of the gully. The parking would be on the north side of the gully. Morey had advised Lamadeleine that even if the building was to be on the south side of the gully then the gully would have to be extended quite a distance and in fact that was done. In the face of the October 20, 1988 letter Lamadeleine hired a bulldozer and extended the gully.

It was Lamadeleine's evidence that Mr. Morey suggested that he remove some material at the riverbank and according to his evidence the bulldozer worked there for approximately a week changing the inclination of the slope and everything was seeded including the gully. It should be noted, however, if one looks at the report of October 20, Morey first comments that a safe set back distance from the river edge for building construction

has been calculated to be 400 meters but that that set back distance might be substantially reduced by ensuring that initial failure of the riverbank does not occur. He then goes on to reference flattening of the slope toe area at the river edge to an inclination of 3 horizontal to 1 vertical and providing erosion protection using rip rap and geo-textile in the lower portion and mulch and seeding for the upper portion. He does, however, comment that the length of riverbank along which the remedial work should be carried out depends on the actual location of the proposed building and the distance between the proposed building and the riverbank. He points out in his initial report that once the desired location for the proposed building has been chosen, the extent of riverbank remedial work can be determined. That can't be the remedial work that Morey is talking about in his evidence.

At no time during this exchange between Morey and Lamadeleine, did Lamadeleine ever tell Morey that he was not going to build on the south side of the ravine.

At Tab 22 is a decision of the Committee of Adjustment relating to the 20 foot extension of the building presently being used as a sugar bush and theatre. The decision notes that construction will be allowed conditional to a report of and supervision by a geo-technical engineer.

At Tab 23 is Golder's report to Lamadeleine dated November 1988 which the plaintiff received and gave to the Township of Cambridge. It was Mr. Lamadeleine's evidence that that report told him what his land was all about, what work had to be done and where the dangers are. He understood that the report told him to build the theatre south of the gully as shown with the circled X on Exhibit 1. If he was to build a new building it was definitely to be on the south side of the gully. At that time he took no steps to advance the location on the south side of the gully and did not plan to put a new building there until he had the experience of the renovated theatre on the north side of the gully. It was his understanding that in order to build on the south side of the gully he had to extend the ravine and also reduce the height of the hill at the shoreline. After receiving the report Mr. Lamadeleine called Mr. Langlois, the architect in Hull, to get the plans for the south side theatre and decided to go ahead with the expansion of the building on the north side of the ravine so that they would have 1 or 2 years of experience behind them before building the new building.

At Tab 25 is a letter from Golder Associates dated December 28, 1988 confirming that the existing ravine has been sufficiently extended and deepened to provide adequate protection against the possibility of a landslide for a building located on the south side of the ravine and east of the west extent of the ravine. Lamadeleine gave this letter to the municipality.

At Tab 34 is another letter received by the plaintiff from Golder Associates dated April 21, 1989 confirming that the report had provided several alternatives for remedial work and that the remedial work alternative chosen and carried out consisted of deepening the existing east west running ravine at the site and extending the ravine westward beyond the proposed building location. Mr. Lamadeleine in his evidence explained that when he went to the building inspector for the Township, Mr. Brisson, for a building permit, Brisson wanted to know what work had been done on the land and, accordingly, Lamadeleine asked Morey for a supplementary letter for that purpose. The building permit being sought was for the expansion of the building on the north side of the ravine. [In my view Lamadeleine knew exactly what was going on here and he was taking advantage of Morey by asking for a letter on the assumption that they were talking about the building site on the south side of the ravine and then presenting the resulting letter to the Township in support of a building permit for a site on the north side of the ravine.]

At Tab 35 is an application for a building permit prepared by Lamadeleine with respect to the expansion of the building on the north side of the ravine. The attached plan shows the proposed extension with a dotted line.

At Tab 38 is a letter from Golder to Lamadeleine dated May 2, 1989 again pointing out the alternatives, one of which (deepening and extending the existing east west ravine) had been carried out. This letter again points out that a second alternative was to flatten the existing riverbank slope toe area and provide protective rip rap and an underlining geo-textile filter to high water level and mulch and seeding. Again it is pointed out that the linear extent of the slope flattening required and further details of the required riverbank work would have to be determined once the location of any proposed building was known. In his evidence Lamadeleine testified that he did not understand the two alternatives. [I do not accept that evidence. It seems clear enough that what Morey was saying throughout all of the documents was simple and straightforward.

1. If you put the new theatre to the south of the ravine all you will have to do is deepen and extend the ravine to safeguard against retrogressive slides.
2. If you propose to put the new theatre to the north of the

> ravine then you will have to do extensive work to the riverbank, the extent of which cannot be finally determined until the location of any proposed building is known.

Lamadeleine, in his evidence, pleading innocence, says he didn't know what rip rap was, and that he thought it was the tree chips and seeding. I do not accept that evidence.]

At Tab 40 is the building permit dated May 12, 1989 issued with respect to the renovation work to the existing building north of the ravine. The Township building inspector inspected the work to completion.

Once it was up and running the combination sucrerie and theatre saw attendance of about 20,000 persons per year and about 12,000 meals per year were being served in the dining room, 7,000 alone in July and August.

At Tab 52 is a letter from the Authority to Lamadeleine dated July 20, 1989 acknowledging his request to participate in the Casselman to Lemieux environmental assessment. Lamadeleine testified that he wanted to know about the entire study and its results.

At Tab 54 is the Golder report to Gore & Story dated August 1989. It is not a report that Lamadeleine received at the time. He may have seen it in 1994 when he was with the Authority or perhaps for the first time in Exhibit 4.

The renovation to the existing building on the north side of the ravine was completed in the Spring of 1989 and business was carried on there in 1989 and 1990. In August of 1990 a fire occurred in an adjacent trailer being used by a theatre group. The fire spread to the building which burned to the ground.

After the fire occurred Lamadeleine intended to rebuild on the south side of the gully because he already had architectural designs for the site on the south side of the gully. It turns out that he could not build on the south side of the gully. The health unit from Cornwall would not allow the existing holding tanks located on the north side of the gully to be moved to the south side of the gully, rather the health unit was requiring that a new well and new septic system be established in the south side of the gully for the new building there. Accordingly, Lamadeleine decided to ask if the plaintiff could build on the same site as the fire destroyed building, that is, on the north side of the gully.

As a result of the prohibitive costs involved in rebuilding to the south of the ravine, the plaintiff decided to ask the municipality if it could build on the same site as the burned down theatre, that is, to the north of the gully. In response the municipality told the plaintiff that it would need soil tests conducted now because of the danger. The municipality gave the plaintiff several names including Paterson and Jacques Whitford. The plaintiff eventually retained both Paterson and Jacques Whitford. To Jacques Whitford he gave the Golder site specific report. At some point about this time, Morey came to the site with the Conservation Authority and told the plaintiff that it could not build north of the gully. Lamadeleine inquired as to why that was so and Morey replied that it was dangerous. Lamadeleine was angry. He had done the work extending the ravine and bringing down the bank and now he was being told that he could not build north of the ravine. If he had extended the building 1 1/2 years before north of the ravine, why could he not build the new building on the same site. [It is difficult to understand how Lamadeleine managed to get a building permit to extend the existing building on the north side of the gully in 1989 in the face of the Golder report which very clearly said that if he wanted to build on the north side of the ravine, he had to do significant remedial work to the toe and slope including levelling, rip rap and geo-textile film and that the extent to which such work would have to extend along the riverbank could only be determined once he located the exact site of the proposed new building on the north side of the ravine.] In any event, according to the evidence of Lamadeleine, Morey told Lamadeleine during the course of this argument that he had given Lamadeleine his opinion and he was free to get another opinion to say either that he was right or wrong.

As it turned out the Jacques Whitford bore hole and the Paterson bore hole were only 8 feet apart and Lamadeleine was surprised at that fact.

Lamadeleine discussed the matter with Dr. Lagarec who disagreed with Morey.

At Tab 63 is a letter from the Eastern Ontario Health Unit dated September 10, 1990. The letter states that the Health Unit had no objection to the plaintiff rebuilding on the same site and using the same facilities for the disposal of waste subject to the condition that he maintain the same seating capacity, namely 210 people.

As a result of all this the plaintiff applied to the municipality to rebuild on the same site, namely the north side of the ravine. At Tab 65 is a request for a building permit apparently received September 26, 1990 by the municipality. That application was originally for a permit to build on the

south side of the ravine but because of the lack of cooperation from the Health Unit, the plaintiff changed the application to apply to the north side of the ravine. At the bottom of the first page of the application is handwriting in building inspector Brisson's writing which reads "Construction de theatre sucrerie au sud de ravine" with "nord" written above the word "sud" and initialed by Brisson.

At Tab 67 is a letter that Lamadeleine wrote to the Authority on October 1, 1990. It is an angry letter, a synopsis of which follows:

> I was informed by the building officer of Cambridge that you have sent a letter including a drawing as to where my theatre restaurant should be built in the future.
> Since the past three years I have spent a great deal of money to improve my land against a possible landslide. Having all this done and discovering now that I may have spent $17,000 for something that may not have been necessary is frustrating. In 1988 there was a plan to build a new theatre and at the request of the municipal council of Cambridge we had to do a geo-technical test for our land. During these tests which I was present the engineers on site mentioned that it was safe and that our land was the same as the land in Ottawa where they were building the new aviation museum. When the report was sent to us it mentioned two alternatives should be considered before building and I must admit that it was a surprise that we had to do that after being told it was safe. [According to Morey he never indicated to Lamadeleine that the area was safe]
> After talking with Randy Morey I was told it was to be on the safe side. Therefore we did the work such as extend the present gully east west and also flattened the existing riverbank slope too.
> The proposed new building was never built because of the cost involved. Incidentally the present buildings that are there are protected also by the three existing gullies which have been determined by your engineer as being a natural barrier against retrogressive landslides.
> In 1989 we applied for a building permit for the expansion of the present building and we were told in early April to obtain a letter that the work had been done. After giving the letter of April 21, 1990 from Golder we did obtain a building permit and did build. [The correct date of that letter is April 21, 1989]
> The engineer Randy Morey who had done the work on our land happens to be also your engineer and this creates a serious conflict of interest.
> It has also be found that all the tests that Golder ever did in this area are questionable and need to be re-evaluated seriously.
> Since the official plan has not been amended and since I have been existing before any changes or any new rulings have ever been decided by anyone, I don't believe anyone can stop the municipality from issuing a building permit as long as it does conform to the zoning by-law.
> The municipality of Cambridge issued a building permit in 1989 because it conformed to their regulations which indicated that every request by Sucrerie Casselman had been met.
> Today the building has been destroyed on August 4 by an accidental fire. The Health Unit has given permission to rebuild providing it be on the same site. To move the future building would represent another additional cost of $75,000 because it would need a new well and septic bed and new pavement.
> If you delay this project you will be brought to court.

In his viva voce evidence explaining the letter of October 1, 1990, Lamadeleine explained that in 1990 things were not good between the Authority and the municipality. There was no agreement between them as to where the line was to go or where the setbacks were to be. Lamadeleine felt that he was in between the two of them and felt frustrated. He did know that to build south of the ravine would be very expensive because of the Health Unit's requirements.

At Tab 69 is the building permit received from the municipality on October 2, 1990 for construction on the south side of the ravine. Lamadeleine let the municipality know that there would be no building on the south side of the ravine because of the expense.

At Tab 70 is the building permit with respect to the site on the north side of the ravine which was received by Lamadeleine on November 26 from the municipality.

At Tab 72 is the Jacques-Whitford report to Lamadeleine dated October 31, 1990. Lamadeleine gave the report to the municipal council so Dr. Lagarec who was their consultant could have a look at it. The Jacques-Whitford report was with respect to the site on the north side of the ravine. Lamadeleine had given Jacques Whitford the Golder report at Tab 23 which contains the map. Jacques Whitford was to test the site where the building had burned on the north side of the ravine. Marked as Exhibit 18 is the survey given by Lamadeleine to Jacques Whitford. At the second last

page of Tab 72 is a part of the survey on which Jacques Whitford identifies the bore hole location, septic tank and other information. The distance of 1156 feet from the proposed site to the riverbank marked "1156 (352.3M)" is in Lamadeleine's writing. He measured parallel to the west boundary line of the lot.

Lamadeleine had told Jacques Whitford of Morey's position and the Authority's position and asked Jacques Whitford to look and see if notwithstanding those positions the plaintiff could put a building on the same site as the burned building.

Some time in November the municipality indicated that the Jacques-Whitford report was not clear, that they were in doubt and that they needed clarification. The plaintiff told Jacques Whitford that they had to indicate that the area was safe but that there was a possibility of a landslide. Dr. Lagarec gave Lamadeleine the wording required. Lamadeleine sent the wording to Jacques Whitford and Jacques Whitford sent the additional report saying that the area was safe but there was the possibility of a landslide. At Tab 73 is the covering letter of transmittal from Jacques Whitford with respect to the report. Having taken the report to the municipality, Dr. Lagarec wrote on page 2 of Tab 73 the suggested wording which says as follows:

> The recommendations made in this report are in accordance with our present understanding of the project and a soil investigation is a limited sampling of a site and after reading the Golder report we agree that there is always the possibilities of landslide along the Nation River. However, after viewing the site such as the gullies, natural berm at the river, the land being forested and drained and adding the distance from the river, we still believe that he type of the building proposed at the site is secure.

That is all in typewriting. The handwriting on page 2 is that of Lamadeleine. It says as follows:

> This note would permit me to obtain a building permit and at the same time allowing you plenty of room in your report. The municipality of Cambridge share the same opinion since Dr. Lagarec did view the site and said there is a very good set back. A years set back along the Nation River will be at 200 meters since Dr. Lagarec has proved that the average landslide that ever occur along the Nation River is average 200 meters. In my case the elements of safety are in my favour.

Lamadeleine's handwriting also appears on the front page of Tab 73. It reads as follows:

> Must indicate in report that "they are aware of possible landslide such as indicated in Golder report but maintain that this building should not be jeopardized by the Nation River".

Tab 73 with Dr. Lagarec's typewritten portion and Lamadeleine's handwritten portion was then faxed to Jacques Whitford.

Of interest is Tab 66 which is a letter that Lamadeleine says that he sent to Jacques Whitford at some later date. In the letter Lamadeleine says:

> I want you to tell me in a letter that you still believe (in the face of the Golder report) that the set back which is about 350 meters is still adequate and should not jeopardize in your opinion the construction of my theatre restaurant. Understand that I already have two letters like that from Dr. Lagarec, geo-morphologist and the firm of John D. Paterson. If their opinion is the same why would it be that you be different.
> I think it is reasonable what I am asking and once I receive this amendment and the reports I left with you then I will mail a cheque immediately.

It was Lamadeleine's evidence that Tab 73 was sent to Jacques Whitford within a week of Lamadeleine obtaining it on or about November 1, 1990.

In view of the Whitford report not being clear, Lamadeleine sent a letter to Paterson confirming the price that he quoted with respect to the study and telling him to go ahead. That letter is at Tab 74 and is dated November 8, 1990. In the letter Lamadeleine indicates that he wants "testing my land to put a building to know if it is safe, also to check the river slope because there is lots of discussion going on about the Nation River. To make a long story short, find out if it is safe to put a building ..."

As a result Paterson came to the site north of the gully and sunk a bore hole 6 to 8 feet away from the Jacques Whitford hole. Lamadeleine told Paterson that Jacques Whitford had worked on his land and that if he wanted information he could also call either the municipality or the Authority.

At Tab 75 is the letter received by the plaintiff from Paterson November 19, 1990. It is a preliminary report confirming that a deep bore hole to bedrock had been put down at the location of the proposed theatre. Lamadeleine commented in his evidence that he was surprised that the Paterson bore hole was in the same area as the Jacques Whitford and that he would have expected the holes to be 600 to 700 feet apart. The preliminary letter from Paterson indicates that the structure is located greater than 340 meters from the crest of the South Nation River, that they have reviewed the Golder report and have used the factual data to assist them in their analysis and that after reviewing the data in that report (Golder report number 8812486 - Tab 23) and on the basis of their findings, it was their opinion that the proposed development complies with the concerns that have been expressed regarding development along the South Nation River. They indicate that their calculations in turn indicate that the proposed structure is set back a distance that is more than adequate to buffer the structure against a possible slope failure should it occur. It is their opinion that the plaintiff should proceed with the proposed theatre. This letter was given by the plaintiff to the municipality. Lamadeleine confirmed in his viva voce evidence that the site that Paterson was discussing was to the north of the gully.

At Tab 76 is a subsequent report from Jacques Whitford dated November 20, 1990 received by Lamadeleine perhaps on November 25. Lamadeleine took this additional report to the municipality and is 99% sure that the municipality already had a copy of it. A review of this report shows that Jacques Whitford has incorporated the wording suggested by Dr. Lagarec to the plaintiff about not completely ruling out the possibility of future landslide. When Lamadeleine presented this report the Township indicated that it was expecting news for him. In turn, Lamadeleine threatened to forget the whole thing because it was getting too late to build. The municipality in the person of Mr. Brunet said that the municipality would make the decision very soon. There was a council meeting Monday evening and Lamadeleine received a phone call on Tuesday telling him to pick up his permit.

Interestingly when Lamadeleine gave this evidence he then referred once again to Tab 76, the report of Jacques Whitford dated November 20, 1990, and indicated that he received that report on the same date.

At Tab 79 is the report from Paterson dated November 22, 1990 which according to Lamadeleine's evidence he received the same day he got his building permit. Again he took the Paterson report to the municipality and gave Brunet a copy. He believes that Brunet had already received the Paterson report.

At Tab 80 is another letter from Jacques Whitford to Lamadeleine dated November 22, 1990. It appears to be quite similar to Tab 76. Tab 76 has the notation on it "sent out but revised after". The difference between the two is as follows. They are the same to the end of paragraph 3 on page 2 of each report. After that point Tab 80 reads as follows:

> Should the conditions of the riverbank (such as erosion etc.) change in the future the overall stability of the site should be assessed at that time. Remedial measures may be required accordingly. Presently removal of vegetation should not be carried out anywhere within the property.

As opposed to that, Tab 76 reads as follows after the end of paragraph 3:

> As a condition of constructing the restaurant at the proposed location we recommend an annual inspection be carried out to assess the stability conditions of the lower slope. Such inspection should be conducted in the spring and should consist of detailed photographic record of conditions such as erosion and other signs of distress. Should the inspections reveal adverse conditions remedial measures may be required. Removal of vegetation should not be carried out anywhere within this property.

[It appears that Jacques Whitford was prepared to accommodate Lamadeleine by rewriting its opinion to some extent.]

Tab 83 is a letter from the municipality to Lamadeleine dated December 5, 1990 which advises that a resolution has been passed to the effect that based on the report of Jacques Whitford, Paterson and Lagarec the reconstruction north of the ravine seems to be secure and a permit be issued for that location. Interestingly Lamadeleine already had his permit by this time and he says that is the usual practice. Indeed he had already started construction by that time. Brisson had done his first site inspection on November 29 with respect to the slab. By the end of 1990 the building was up. It was finished in January of 1991 and the theatre was ready by February of 1991. The theatre had 292 seats and operated through the summertime. The restaurant operated during sugaring time and all was well, the business being operated in the normal course.

In the Summer of 1992 the plaintiff happened to meet the whole Board of directors of the Authority in a Casselman restaurant. He had some discussions with them following which he was determined to find out the status of his land and accordingly wrote to the municipality in that regard. It appears that he wrote on September 10, 1992 although that letter is not available. In response to that letter the Clerk of the Township, Brunet, wrote the letter at Tab 88 dated September 15, 1992. The letter, in effect, says that by-law 155-90 stipulates that any given property is out of the danger zone when a site specific study recognized by the Ministry, proves it to be so and that while there has been such a study with respect to the plaintiff's land notwithstanding that study the land continues to be in the danger zone.

The letter of September 10 was eventually found and filed as Exhibit 22. In it the plaintiff informs the municipality that he has met with the Authority and the zone in which his building is located is still dangerous. He expresses the belief that based on the reports, his property should not be within the zone.

The letter at Tab 88 gave the plaintiff some comfort.

At Tab 89 is the report of Golder Associates dated April 13, 1993 to the Authority. Lamadeleine first saw this during the course of a large public meeting of people who wanted to know if there were possibilities of landslides on their land. Lamadeleine had joined the Authority in 1992 and had learned a lot as a result of his involvement. The hazard line was discussed at every meeting. The people in the area wanted to know what the risk was.

At one of these meetings Lamadeleine stood and said that he had spent all of this money and that the line should be moved so that his property was excluded. The planner at the meeting retained by the Township indicated that there was no problem and that Lamadeleine should come to speak to him. Lamadeleine subsequently met with planner and brought his reports along. Again Lamadeleine asked them to move the line and the planner said that he would look into it. His general concern at the time and the concern of the other land owners was that the banks were hesitant to refinance mortgages on properties within the line and therefore they wanted it changed.

Sometime after his meeting with the planner Lamadeleine received a map and was invited to a meeting with the Township where the map was discussed. As it turned out, on the map Lamadeleine's property had been removed from the hazard area. At Tab 93 is probably the memo and map that was received by Lamadeleine. It is dated 1995.08.30 or August 30, 1995. The attached memo explains that the reason for the new map is that updates have been made to the line to properly reflect all geo-technical studies which have been conducted along the South Nation.

At Tab 95 is the notice of the passing of an official plan amendment by the Township of Cambridge. The notice points out that the Township has passed by-law 24-95 on the 10th of October, 1995 adopting proposed official plan amendment #51 which will introduce a new overlay designation on the official plan to be known as the landslide potential area. The notice indicates that the implementing zoning by-law will zone the lands contained within the landslide potential as hazard lands and that a zoning amendment will be required to remove a property from the zone. The effect of the by-law passed by the municipality was to remove the plaintiff's land and other lands from the hazard zone. At Tab 98 is the by-law 25-95 which had the effect of excluding the plaintiff's land from the hazard zone.

As a matter of interest at Tab 103 is a resolution of the Township that in by-law 25-95 the term hazard be deleted and the word study be inserted in its place.

At Tab 105 is a letter from solicitor Laviolette dated May 13, 1996 addressed to the municipality advising that her client is interested in purchasing the property and inquiring whether or not the plaintiff's property is within the sensitive protection area. Lamadeleine explained in his evidence that Mrs. Rita Benson who worked at the sugar bush for him was interested in buying his place. After expressing that interest he told her to find out if she could buy it. At Tab 106 is a letter from the Municipality advising that "the geologist study of 1993 confirms that the property is outside the potential of land slide zone". The letter is dated May 15, 1996 and goes on to suggest that Ms. Laviolette obtain the same confirmation from the Authority. At Tab 107 is the letter from the Authority in response to Ms. Laviolette dated June 12, 1996 explaining that the property is in fact within the hazard area and explaining that the municipality's response to Ms. Laviolette dated May 15, 1996 is in error in suggesting that a study in 1993 confirmed that the property was outside of the potential landslide zone and that the only issue before the OMB was whether to name the zone the "study line zone" as opposed to the "hazardous landslide zone".

At Tab 108 is the plaintiff's letter to Caisse Populaire inquiring as to what financing might be available in the event that the buyer wanted to

finance. At Tab 109 the Caisse's reply dated June 25, 1996 indicates that commercial property may be financed to the extent of 60 to 70 per cent of its market value but no financing would be available for anything in the study zone.

At Tab 110 is the letter from Janet Bradley to the municipality on behalf of the plaintiff dated July 18, 1996. The letter is in error to some extent in that paragraph 9 is incorrect in saying that in 1996 the theatre was listed for sale. Mr. Lamadeleine confirmed in his evidence that the property was never listed for sale and Mrs. Benson was the only one who expressed any interest at buying it.

At Tab 111 is the letter from the municipality to Janet Bradley dated September 13, 1996 enclosing an explanatory note which goes through the history that we have already seen.

The pre-hearing before the Ontario Municipal Board was held on October 9, 1996 and Lamadeleine has no recollection of whether he was there. Following the pre-hearing, however, he did retain Allan Cohen.

At Tab 116 is a letter from the municipality to Lamadeleine dated October 23, 1996 advising him that it would be necessary for him to get another geo-tech engineer to look at the property. Lamadeleine thought that the Township no longer considered the property safe and wanted verification from another engineer. Lamadeleine asked who was the best and the Township referred him to McRostie.

At Tab 118 is a letter from the municipality to the plaintiff dated November 27, 1996 advising that the Authority wanted the municipality to vary the by-law to change the hazard line to include the plaintiff's property and the municipality was waiting for information as to whether the plaintiff had a new consultant. The plaintiff responded to the municipality's inquiry by letter dated December 5, 1996 saying that the new consultant's report would be in by December 18.

When the OMB hearing was held Lamadeleine attended. He heard Miguelez telling the Board hearing that he, the plaintiff, had assured him that the Authority had approved the reports of Jacques Whitford and Paterson. Lamadeleine stood up and said that was not true. He was told by the Board to sit down. He was told that he would have a chance to speak at the end. At Tab 131 is a statement by the plaintiff Lamadeleine as to what he said at the OMB hearing on February 7, 1997 at the end of the hearing.

At Tab 136 is the plaintiff's insurance policy for the period April 5, 1997 to April 5, 1998. At Tab 135 is Mr. Leamen's letter to Paterson and Associates dated March 20, 1997 and Mr. Leamen's letter to Whitford bearing the same date. Both these letters were sent on the direction of Lamadeleine. At Tab 137 is Rasmussen's reply to Mr. Leamen advising that Whitford has not changed its opinion and that assuming conditions have not changed at the site since the time of the initial report, there was no reason to believe that the property is in danger of a retrogressive slide.

At Tab 138 is the plaintiff's letter to its insurance broker, Reid Stenhouse, dated June 27, 1997, advising the broker that the Authority has asked the OMB to put his property back into the study zone and inquiring as to what the effect and coverage will be. The broker's response is at Tab 139 advising that the policy as presently written does not exclude landslide risk but the insurer has advised that in order for them to remain on the risk, Reid Stenhouse must add a landslide exclusion to the policy immediately.

Tab 140 is the report and Decision of the OMB dated February 7, 1997. From this report Lamadeleine understood that his property was back in the study zone. At this point Lamadeleine understood that he would have a hard time operating the theatre and he had to consider closing in view of the fact that there would be no insurance for a landslide.

Lamadeleine testified that before this happened he trusted the Township. The Township said the property was safe and he believed them. Since sitting on the Conservation Authority, he now recognizes that there is a danger.

Lamadeleine again declared that now he is not satisfied with the safety of his land and feels he can't operate the business again because of the danger to the people. All this after having invested over $800,000 in the building.

While he did not operate the business after the OMB hearing in 1997, he does still maintain the building and of course has to continue paying the mortgages on the building. If he could borrow enough money he would pay off the mortgages on the building and put the building down.

If it was possible to do so he would move the building to the south side of the ravine. Unfortunately in 1991 he sold the piece of land to the south of the ravine to neighbours for their horses. He has gone to those people and offered to buy the property back and he even offered more money than they paid but they have declined.

The building put up in 1990 was 90 feet by 90 feet and a beautiful building, according to Lamadeleine, with a capacity for 300 people. It had dressing rooms and a stage 28 x 22 feet with a rotating floor. There was a kitchen and a restaurant which accommodated 220 diners. There was a stage in the restaurant for country music presentations. There was a bar and 8 washrooms. The building was heated and air conditioned and there were 6 independent air conditioning systems. The building was equipped with a sophisticated fire alarm system and a sprinkler system.

At Tab 141 is the insurance policy for April 5, 1998 to April 5, 1999 with the landslide exclusion clause.

Mr. Leamen then reviewed with Lamadeleine the Damages Brief which was put in as Exhibit 23. With respect to putting up the new building Lamadeleine explained that he had a replacement cost endorsement on the policy covering the old building and with respect to the first $400,000 of costs, Reid Stenhouse oversaw payment. The contractor would give the bill to Reid Stenhouse in stages, the bill would be approved and paid. Lamadeleine does not have copies of the bills. He explained that in 1992 Mr. Fontez who was the director of economic development for Prescott and Russell and who had been helping him with the project, got angry, came to Lamadeleine's place, took the corporate books and receipts and Lamadeleine never saw them again. Apparently Lamadeleine had refused to co-sign a loan for him. Fontez has since moved to France. I understand that the representative from Reid Stenhouse will be called.

It was obvious that the money available under the insurance policy even with a replacement cost endorsement would not cover the cost of the new building. Accordingly, Lamadeleine borrowed an additional $150,000 from the Ontario Economic Development Bank. As well he put in $7,000 of his own money and borrowed another $15,000. He is personally on the covenants with respect to those borrowings.

At Tab 1 of Exhibit 23 is the $150,000 mortgage. At Tab 2 is the $50,000 mortgage with the La Societe D'Expertise et de Financement de Prescott Russell which loan was incurred for equipment.

At Tab 3 is the appraisal prepared by Norman Lemay that Lamadeleine obtained as a result of the insurance company's request in 1993. Lemay values the property at $640,000. Apparently Lemay will testify at the trial.

At Tab 4 is another appraisal that apparently was obtained from Mark Shenk and Associates when Rita Benson was expressing some interest in buying the property and wondering how much it was worth.

At Tab 5 is the account from Janet Bradley in the amount of $3,773.56 on account of her involvement. As well at Tab 5 is Cohen's bill. The two bills total some $12,075.75 with respect to work performed in connection with the OMB hearing. At Tab 6 are the insurance costs incurred since terminating the business in September of 1997.

At Tab 7 is McRostie's bill in the amount of $2,675.

At Tab 8 is the account from Specs Audio who was called in to evaluate the equipment. You will see that the evaluation is with respect to the cost of the equipment new which is some $78,900. Apparently he will testify that today it is worth $13,000.

At Tab 9 is an estimate from P.F. Donnelly Construction Limited indicating the replacement cost of the building including G.S.T. to be $651,895 and that the cost to replace the parking would be another $55,640. The cost of rebuilding the outside patio would be some $12,000. At Tab 10 is evaluation of the restaurant equipment in terms of what the plaintiff paid for it which is some $56,788. Its present value is $6,000.

At Tab 11 is the estimated cost of demolishing the building at $23,272. At Tab 12 is another estimate for demolition at $24,895.

At Tab 13 is an appraisal of the 22 acres and structures at the present time in the amount of $35,000 by Sutton Group. At Tab 14 is a similar appraisal by Lemay in the amount of $20,000. It should be noted that Leamen advises that the plaintiff is not looking to be compensated for any diminution of land value.

At Tab 15 are records of taxes paid for the land north of the gully with the building situate thereon. Apparently Leamen has asked for information with respect to what the taxes might be with the building demolished.

At Tab 16 are hydro bills for heating the building and keeping it going from 1997 to 1999.

Cross-Examination of Lamadeleine by Rasmussen

Lamadeleine was born in Hawkesbury approximately 45 minutes from Casselman and moved to Casselman when he was 2 1/2 years old. He would not necessarily agree with Rasmussen's suggestion that everyone between Lemieux and Casselman would be aware of the trouble on the river with landslides. He testified that after the 1971 slide he had no concern with respect to the river between Casselman and Lemieux. He conceded that in his life insurance and investment business since 1961 he knew several people who owned river properties. As well he has been involved in local politics since 1985 when he became reeve of Casselman and continued with that position until two years ago.

Lamadeleine bought the subject property in 1982. He paid $45,000 for it in January of 1982. He eventually transferred part of it to the plaintiff company and kept about 8 acres for himself. At Tab 10 of Exhibit 4 is an application to rezone the subject property. The map at the back of Tab 10 is a map of the property. Lamadeleine explained that the dark portion of the lot is the portion conveyed to the plaintiff company. On that portion of the lot was a large building in the bush approximately 40 x 60 feet and a boiling shack. It was this large building that was extended in 1989 to turn it into a theatre and restaurant.

At Tab 8, Exhibit 4, is a letter from the Ministry to Lamadeleine dated November 10, 1987. The letter reads in part as follows:

> The concerns you describe are unfortunate. These concerns are shared by other property owners along the South Nation River. Our Ministry's role is to determine how serious the landslide problem is and to recommend appropriate building set backs or other solutions for consideration by the Township.

In the face of that letter Lamadeleine refused to concede that he had expressed concerns to the Ministry and testified that if he had any concerns it was with respect to the size of the land that he wished to develop. He went on to testify that the only concern that he might have had would have been for the sugar bush. When it was pointed out to him that the letter refers to landslide problems, he admitted to the possibility that he had expressed concern about landslides along the river that might effect his land.

Referencing Tab 10, Lamadeleine confirmed that by-law 122-88 was passed January 5, 1988 to change the zoning on the property owned by the plaintiff company. It was then that the plaintiff company started development.

At Tab 11 is a letter from the Ministry to the municipality dated January 4, 1988, one day before the by-law was passed rezoning lot 17. The letter reads as follows:

> We have these comments on the proposed by-law for the above-noted property. As you are aware we have commented on the Township's comprehensive by-law with regards to the extent of the earth flow zone along the South Nation River. We note this by-law recognizes the existing land use and does not propose any new development. We would comment that this property is partially within the earth flow zone and should be subject to the earth flow restrictions outlined in Section 6.26 of the draft comprehensive by-law.

It was Lamadeleine's evidence that the municipality never advised him of this letter.

At Tab 9 is a letter from the Ministry to Lamadeleine dated December 14, 1987 enclosing a map outlying "known earth flow failures near your property" and advising that these failures have been identified as occurring in the 1800's. The Ministry further advised Lamadeleine that in the earth flow zone between Lemieux and Casselman, 18 large failures have been identified and 3 have occurred in the last 95 years. Lamadeleine admitted that he had received this letter at Tab 9 advising of the potential danger and conceded that that letter and the letter at Tab 11 were in response to his application to have the land rezoned.

The letter of January 4, 1988 from the Ministry to the municipality makes reference to Section 6.26 of the draft comprehensive by-law. The draft comprehensive by-law is at Tab 12 and Section 6.26 of that by-law refers to slope protection set backs. Lamadeleine conceded that by its letter dated January 4, 1988 (Tab 11) the Ministry did make known to him that there were certain restrictions with respect to set backs.

At Tab 18 is a letter from the Ministry to Lamadeleine dated September 19, 1988 acknowledging that Lamadeleine has engaged Randy Morey of Golder Associates to address the stability concerns and problem of earth flow retrogressive failure in relation to the subject lands. The letter states in part as follows:

> I have discussed the proposal with Cornwall District Office. Your application for development will be reassessed on receipt of the report. Based on the investigation should the

> information provided by the geo-technical consultant warrant, a reduced set back will be considered.

At Tab 19 is a notice of public meeting concerning the proposed minor variance to zoning by-law 72-78 to effectively permit Lamadeleine to enlarge the existing building to be used as a theatre and sucrerie. At Tab 22 is the Decision of the Committee of Adjustments permitting the extension to the building on the condition that the construction be under the direction of a geo-technical engineer. That Decision is dated October 31, 1988. By that time Lamadeleine had received Golder's interim report dated October 20, 1988 which is located at Tab 20. The interim report reads in part as follows:

> The purpose of this evaluation was to determine, based on the results of one detailed sampled and tested bore hole, the potential for retrogressive flow slide or earth flow to occur at this site and to determine a safe set back distance from the river (South Nation) for the construction of a proposed theatre building. Remedial measures to reduce or eliminate a required construction set back distance were also to be presented if considered necessary.

The report goes on to advise that based on the results of the in situ and laboratory testing and empirical relationship which can be used to relate soil parameters with the potential for flowslide, or earth flow phenomena, it was considered by Golder that the general site area was susceptible to retrogressive flow sliding but probably not susceptible to the more devastating earth flow form of landslide. The report calculates a safe set back distance from the river edge to be 400 meters and notes that that set back distance might be substantially reduced by ensuring that initial failure of the riverbank does not occur by carrying out significant remedial work, all of which is set out in the first full paragraph on page 2 of the letter. Morey points out in this paragraph that the extent of the riverbank remedial works could not be determined until the desired location for the proposed building has been chosen.

The second full paragraph on page 2 of the interim report of Morey dated October 20, 1988 points out that the portion of the plaintiff company's lands to the south of the east west ravine is naturally protected from retrogressive landslides and that if the desired location of the proposed building was somewhat outside of the area naturally protected by the ravine, the ravine could be extended and/or deepened to provide suitable protection.

At Tab 23 is Morey's full report dated November 1988. The report acknowledges that the plaintiff plans to construct a theatre building in the south east corner of the site some 300 meters south of the river shoreline and that the location of the proposed theatre building is within a Ministry of Natural Resources designated earth flow area.

Rasmussen directed Lamadeleine to Tab 25, Morey's letter to him dated December 28, 1988, referencing two additional site visits; one on October 19, 1988 for the purpose of discussing the location at the site where construction of the proposed theatre building would require no remedial works and a second site visit on November 23, 1988 to inspect and approve the completed remedial works. Lamadeleine acknowledged that at the site being discussed was the site to the south of the ravine. The letter of December 28 confirms that the inspection on November 23, 1988 indicated that the existing ravine had been sufficiently extended and deepened to provide adequate protection "against the possibility of a landslide for a building located on the south side of the ravine and east of the west extent of the ravine".

At page 10 of the final report, Tab 23, under the heading remedial works, Lamadeleine acknowledged that Morey said the following:

> A safe set back distance from the river shoreline for building construction at this site is considered to be 400 meters. This set back distance may be substantially reduced by ensuring that initial failure of the riverbank does not occur.

At page 11 of the report Morey says the following:

> Detailed stability analyses have not been carried out to determine exactly the appropriate remedial measures required to stabilize the riverbank, however, based on previous slope stability analysis carried out within the general area of the site, it is considered that flattening of the slope toe area at the river edge to an inclination of 3 horizontal to 1 vertical together with some upper slope flattening and providing erosion protection using armour stone rip rap and geotextile in the lower portion and mulch and seeding for the upper portion should be sufficient.

In his evidence Morey claimed not to know what all that meant. Rasmussen put it to Lamadeleine that if he had told his lawyer, Mr. Cohen, that he had done all the work required by the Morey report how could he possibly have

told Cohen that if he did not understand what work needed to be done. Lamadeleine responded that he understood from Morey that the shoreline was a bump and would have to be made into a valley. Rasmussen reminded Lamadeleine of the fight at the site after the fire involving the municipality, the Ministry, Morey and himself when Morey pointed out that the remedial work at the shore had not been done. Lamadeleine admitted that when he told Cohen that the work had been done, Morey had already told him that it had not been done. When Rasmussen asked him why he would do that, Lamadeleine explained that what he told Cohen was that he did what he understood had to be done. I don't accept Lamadeleine's evidence in this regard.

In the face of that portion of the Morey report just referred to, Lamadeleine maintained his position that he thought armour stone rip rap referred to in the report was wood chips. He repeated his evidence that he didn't know what armour stone rip rap or geotextile was nor did the municipality and that he did not think to ask Morey what it was. Lamadeleine denied Rasmussen's suggestion that he didn't ask Morey what it was because he didn't intend to do the work. Obviously, suggested Rasmussen, if he didn't understand what Morey was talking about then he could not do the remedial work.

The report at page 11 goes on as follows:

> The length of riverbank along which the remedial work should be carried out depends on the actual location of the proposed building and the distance between the proposed building and the riverbank. Once the desired location for the proposed building has been chosen, the extent and details of the riverbank remedial work can be determined.

Lamadeleine conceded that he never got to that point.

Lamadeleine acknowledged that as a condition to the construction of the extension the municipality made it a condition that the construction be done under the direction of a geo-technical engineer. He explained that he retained Randy Morey for that purpose and he acknowledged that the construction was to be to the north of the ravine. Rasmussen inquired of Lamadeleine whether he had ever said to Morey that he was going to put a 20 foot extension on the building to the north of the ravine and would he please tell Lamadeleine what he had to do in order to make the building safe. Lamadeleine indicated that he had not done so. The Township had a building inspector and he simply assumed that the Township was satisfied.

At Tab 67 is Lamadeleine's letter to the Conservation Authority dated October 1, 1990. The second paragraph on page 2 of the letter reads as follows:

> In 1989 we applied for a building permit for the expansion of the present building and we told early April to obtain a letter that the work had been done. After giving the letter of April 21, 1989 from Golder we did obtain a building permit and did build.

Lamadeleine denied to Rasmussen that he knew full well that Morey would not approve construction north of the ravine without the remedial work being done on the slope. Lamadeleine conceded, however, that Morey had told him very clearly that construction on the north side of the ravine would be unsafe unless the remedial work was done as he recommended. Then Lamadeleine went on to acknowledge that he did not do the remedial work on the slope as recommended by Morey. He acknowledged that he never called Morey to have him come out to check on the slope work and to confirm that it had been done in accordance with his directions and he knew that Morey had said that construction to the north of the ravine was dangerous unless the river edge work was done. Lamadeleine then acknowledged something interesting. He agreed that he knew that the ravine work would not give protection to a building built on the north side of the ravine. Lamadeleine begrudgingly acknowledged that Morey had said in his report that if the building was not set back 400 meters (which would take it south of the ravine) then the remedial work had to be performed on the river slope. Lamadeleine acknowledged that Golder's letter of December 28, 1988 very clearly points out that the ravine sufficiently extended and deepened, would provide adequate protection against the possibility of a landslide for a building located on the south side of the ravine. Lamadeleine explained that both works, the work with respect to the ravine and the work at the river, were done at the same time and were completed by November of 1988.

At Tab 34 is Morey's letter to Lamadeleine dated April 21, 1989 pointing out that the remedial work alternative chosen and carried out consisted of deepening the existing east west running ravine at the site and extending the ravine westward beyond the proposed building location. Lamadeleine conceded that it was clear from this letter that Morey was of the view that Lamadeleine had chosen and undertaken one of two alternatives. Lamadeleine admitted in his evidence that Morey never reported that he, Lamadeleine, had done any work on the river slope. He commented that he doesn't know how Morey could have missed it if it was

done but that assuming it was done it was evident from this letter that Morey had missed it. Lamadeleine did not call Morey after receiving the letter of April 21st. He felt it was up to the Township to be satisfied. He explained simply that he wanted to build to the north of the ravine. He told the municipality that and the municipality told him to get Morey to tell the Township what work had been done.

At Tab 38 is a letter from Morey to Lamadeleine dated May 2, 1989 again setting out the alternatives and pointing out that the ravine alternative work had been carried out and pointing out that the linear extent of the slope flattening alternative required and further details of the required riverbank work could be determined once the location of any proposed building is known. Rasmussen asked Lamadeleine why he had not told Morey of the site on the north side of the ravine during the course of their meeting on May 1, 1989 which is referred to in the letter, Lamadeleine at first, in his evidence, suggested that he might have told Morey about the north site during that meeting and then conceded that obviously he had not.

At Tab 40 is the building permit for the extension. It is dated May 12, 1989. The application is at Tab 35 and dated April 24, 1989. By the time of the application Lamadeleine had Morey's letter dated April 21 and his letter dated May 2nd and he conceded that he did not tell Morey that he had applied for a permit to extend the building on the north of the ravine because he knew Morey would not have given him letters with respect to that site, although Lamadeleine disagreed that he did not want Morey to know that he was going to build on the north side. [In my view, Lamadeleine purposely withheld from Morey the fact that he intended to extend the building located to the north of the ravine, understanding full well the contents of Morey's reports to him and knowing full well that Morey would not approve.]

At Tab 46 is a letter from the Authority dated June 6, 1989 setting out the possibility of three options: relocation, buy out or stabilization. Lamadeleine acknowledged having received this letter. Rasmussen put to him that during the years 1988, 1989 and 1990 he knew that landslide studies were on-going and that they might result in landowners being offered an option or not. Lamadeleine acknowledged that but testified that he thought it related only to Lemieux, notwithstanding that the opening line in the letter relates to "land adjacent to the South Nation River from the Village of Casselman to the hamlet of Lemieux" as being at risk from landslide activity. Lamadeleine in his evidence claimed not to be aware of Spevaks evaluation of his theatre restaurant (Exhibit 21) and suggested that somehow the evaluator got on to his property and into his theatre without his knowing it.

After the theatre restaurant burned down on August 4, 1990, there was a meeting on site with the municipality, the Authority and Morey and according to Lamadeleine's evidence, it was at this time that Morey told him that the work he had done on the river slope was not sufficient and suggested to him that if Lamadeleine didn't like his opinion, he would get other opinions. Lamadeleine went on to explain that at first he wanted to build to the south of the ravine but the health unit had told him that in order for him to do so he would have to put in a brand new water and septic system whereas if he built to the north he could use the same holding tanks that had been used by the expanded building. The letter from the health unit, (Tab 63) however, makes no mention of a prohibition from building on the south side but rather simply says that he will be permitted to use the same sewage facilities for his new building. In any event, Lamadeleine testified that he decided that he was not going to put in a new septic system in order to locate his new building on the south side of the ravine. He decided then to do whatever he could to build on the north side of the ravine.

By this point in time Lamadeleine was quite aware that the Authority objected to his building on the north side without the remedial shore work being done. The municipality told him to get someone who will say that the new building on the north side of the ravine would be safe.

Lamadeleine then called both Jacques Whitford and John D. Paterson. He attended at their offices and reviewed documents with them. After these meetings he first retained Jacques Whitford. He received the Jacques Whitford report on October 31, 1990. It is located at Tab 72. It would appear that the scope of the work to be done by Jacques Whitford was rather limited that is to investigate the soil conditions at the proposed building site and to survey the gully immediately adjacent to the proposed building site in order to determine slope stability conditions. The report does, at page 7, comment that "the stability condition of the Nation River located approximately 350 meters north of the proposed restaurant is not of concern. It is not expected that instability of the riverbank will jeopardize the proposed building at the location investigated. Presently the slope shows no sign of erosion however should erosion occur in the future, control measures should be implemented to maintain a safe slope stability." Lamadeleine testified that he had told Jacques Whitford that he had to rebuild on the same site because of the health unit.

Upon receipt of the Jacques Whitford report Lamadeleine took a copy of it to the municipality and the municipality told him that it would not issue a building permit based on this report.

Lamadeleine had been dealing with Dr. Daniel Lagarec who had been working for the Township and Lamadeleine decided to retain Dr. Lagarec personally having regard to the position of the municipality with respect to the Jacques Whitford report. Dr. Lagarec's report is dated November 15, 1990 and is contained at Tab 3 of Exhibit 25. Lagarec's report reads in part as follows:

> In summary, in the present case, the actual geo-morphemic and hydrological conditions are not favourable to landslide occurrence and the material properties indicate a limited potential retrogression. It would need a very important change in river dynamics to create such conditions. So I think that you can build where you plan to do it as long as the load is not excessive and well distributed.

It was Lamadeleine's evidence that Lagarec explained the Jacques Whitford report to him and explained that the report didn't mention enough about landslides and did not set a sufficient set back.

Lamadeleine was reluctant to admit that he wanted Jacques Whitford to change its report so that he could get a building permit. He did admit, however, that he went to Jacques Whitford with the document at Tab 73. The document has a typewritten paragraph authored by Dr. Lagarec for incorporation into the Jacques Whitford report. In his own handwriting Lamadeleine notes on the document that:

> This note would permit me to obtain a building permit and at the same time allowing you plenty of room in your report. The Municipality of Cambridge share the same opinion since Dr. Lagarec did view the site and said there is a very good set back. Set back along the Nation River would be at 200 meters since Dr. Lagarec has proved that the average landslide that ever occurs along the Nation River is average 200 meter. In my case the elements of safety are in my favour.

On the front page of this document directed to Jacques Whitford, Lamadeleine has written the following:

> Must indicate in report that "they are aware of possible landslide such as indicated in Golder report but maintain that this building should not be jeopardized by the Nation River".

At Tab 76 is Jacques Whitford's letter to Lamadeleine dated November 20, 1990. The letter purports to outline Jacques Whitford's position regarding the risk of the proposed building being jeopardized by the potential instability of the South Nation River "located some 200 meters north (shortest distance rather than measured parallel to the property line) of the building site". The report refers to discussions had with Lamadeleine and the fact that Jacques Whitford has reviewed the Golder Phase 1 report at Lamadeleine's request. The report concludes that one cannot completely rule out the possibility of a future landslide similar to the 1971 and the 1910 slides anywhere along this stretch of the river and that possibilities of similar failures vary widely along the river. Dealing with Lamadeleine's specific site the report notes the presence of vegetation along the riverbank and the entire lot as an important contributing factor towards stability. It notes the terrace that the site has some 8 meters or less above the river level which reduces the effect of slope height thereby reducing the stability number Ns and limits the magnitude of pore water pressures which could develop in a rapid draw down condition. As well this report notes that the riverbank conditions east of the site are rather different and that the possibility of a retrogressive failure at that site has not been investigated and could possibly jeopardize a portion of the present site. The report notes, however, that there is a ravine between the proposed restaurant and the east property line which might act as a potential barrier of retrogressive failure. Finally, the report says the following:

> Provided that the existing site conditions are unaltered, the risk of a retrogressive failure jeopardizing the proposed restaurant is very low. Retrogressive failure at this site would likely be confined within the mid slope terrace.

The letter from Jacques Whitford dated November 20, 1990 was given to the municipality and the municipality was still not prepared to issue a building permit. Lamadeleine went back to Jacques Whitford with the November 20th letter, marked up in his handwriting indicating the changes that he wanted. See Exhibit 17. The letter of November 20th, Tab 76, had closed with the following paragraph:

> As a condition of constructing the restaurant at the proposed location we recommend an annual inspection be carried out to assess the stability conditions of the lower slope. Such inspection should be conducted in the spring and should consist

> of detailed photographic record of conditions such as erosion and other signs of distress. Should the inspections reveal adverse conditions remedial measures may be required. Removal of vegetation should not be carried out anywhere within the property.

The letter of November 22nd which was received by Lamadeleine around November 26th changes the letter of November 20 with the following final paragraph replacing the original:

> Should the conditions of the riverbank (such as erosion etc.) change in the future the overall stability of the site should be assessed at that time. Remedial measures may be required accordingly. Presently removal of vegetation should not be carried out anywhere within the property.

That letter of November 22, 1990 is at Tab 80. Lamadeleine gave this letter to the municipality. Interestingly the municipality had already issued a building permit by the time Lamadeleine got there with the letter of November 22nd. Apparently the municipality already had a copy of the November 22nd letter when Lamadeleine attended.

At Tab 81 is the building inspector's report dated November 27th. It relates to the inspection of the footings. At Tab 82 is the building inspector's report with respect to the tile drains dated November 29th.

Lamadeleine then explained that while the building permit had been issued on November 26th the municipality would not give it to him at that time. The permit is at Tab 70 and appears to be dated October 16, 1990. At Tab 69 is a resolution of the Township dated October 2, 1990 permitting construction of the building on the south side of the ravine.

In the face of the Municipality not being prepared to issue a building permit based on the Jacques Whitford report dated October 31, 1990, Lamadeleine decided to retain Paterson. The letter of retainer is dated November 8, 1990 and is at Tab 74. It refers to:

> Testing my land to put a building to know if it is safe also to check the river slope because there is a lot of discussion going on about the Nation River. To make a long story short find out if it is safe to put a building. Tell me what will be the total cost before you come down.

Again, Lamadeleine explained that he had to find out whether the building would be safe or not. Jacques Whitford was not clear and he could not obtain the building permit with Jacques Whitford's report and letters and therefore he called Paterson.

Lamadeleine acknowledged that Morey had said it was not safe to put the building to the north of the ravine. The Jacques Whitford report was not good enough to see a building permit issued and as a result Lamadeleine was now going to a third geo-tech engineer, Paterson. He acknowledged that he was fighting for the north side in the face of the knowledge that there was a difference of opinion among the experts.

The Paterson preliminary report dated November 19, 1990 is at Tab 75. The preliminary report confirms that a bore hole has been put down at the location of the proposed building which is located "greater than 340 meters from the crest of the South Nation River". The report reads in part as follows:

> We have reviewed the Golder report 881-2486 and have used the factual data to assist us in our analysis. After reviewing the data in that report and on the basis of our findings it is our opinion that the proposed development complies with the concerns that have been expressed regarding development along the South Nation River. At this time our final report on the matter has not been completed however our calculations indicate that the proposed structure is set back a distance that is more than adequate to buffer the structure against a possible slope failure should it occur. As such it is the opinion of this firm that you should proceed with the proposed sucrerie theatre.

On receipt of this preliminary report Lamadeleine gave to Paterson Tab 77 which is the typed paragraph authored by Lagarec for insertion into Paterson's report. Lamadeleine's written notation on the paper is:

> This is important in order to obtain my building permit and it gives you plenty of room.

It was after their preliminary report that Paterson asked as to the contents of the Jacques Whitford report. Upon receipt of Paterson's preliminary report Lamadeleine gave it to the municipality who said that it was good but not good enough.

At Tab 66 is a undated letter from Lamadeleine to Jacques Whitford. In the letter Lamadeleine confirms that he has asked Jacques Whitford for an amendment since it is very important to him. He acknowledges that he has asked Jacques Whitford to read the Golder report 881-2486 and to "tell me in a letter that you still believe that the set back which is about 350 meters is still adequate and should not jeopardize (in your opinion) the construction of my theatre restaurant which is one story high." Lamadeleine explained that he got the 350 meters from converting the distance that he measured in feet and put on the map. This letter to Jacques Whitford must have been after the report from Paterson because it refers to it.

Finally, the Paterson report dated November 22, 1990 was received. It is at Tab 79. Paterson reached the following conclusion:

> Based on the results of this study it is the opinion of this firm that the slopes bordering the South Nation River at this particular site are not in their present condition considered to be unstable. It is also our opinion that should a failure of the banks occur it would not retrogress back to the location of the proposed building.

In the first paragraph of the report Paterson notes that the site is located approximately 340 plus or minus meters from the crest of the slope.

Finally the building permit issued and Lamadeleine started to construct the new building. Lamadeleine acknowledged that after the building was constructed he continued to report to the Township his concern as to whether or not his lands would be included in the hazard zone. He acknowledged that his retainer of Paterson and Jacques Whitford had nothing to do with where the hazard line would be drawn and over and above the fact that he got his building permit, he was still concerned that the hazard line might include his land and that was the cause of his continuing involvement with the Township as the studies continued to come in. He had Laviolette write to the municipality in May of 1996 trying to get the Township to confirm that he was not in the hazard zone. This is at the time that Benson was expressing an interest in buying the property. Rasmussen put to Lamadeleine that if Benson was concerned about the hazard zone, why did he simply not give the Paterson report to Mrs. Benson. He replied that Mrs. Benson, had she purchased, would have been looking for financing and it was thus appropriate that the inquiry be made. [It would appear that Lamadeleine understood full well the difference between obtaining a building permit and the possibility that his property might still end up in the hazard zone.]

At Tab 108 is Lamadeleine's letter to Caisse Populaire dated June 1996 inquiring as to financing. Lamadeleine confirmed that by that time he knew full well the Authority's position. He denied that he was setting up a lawsuit. The Caisse's answer is at Tab 109.

Rasmussen reminded Lamadeleine that his evidence was that he got the Shenk appraisal dated September 22, 1994 when Mrs. Benson expressed interest in buying. Rasmussen asked Lamadeleine why he waited almost two years until the Spring of 1996 to write to the Caisse and the municipality. He responded that "She was slow to make up her mind."

At Tab 110 is the letter from Gowlings to the municipality for which Lamadeleine provided the information. The information in paragraph 9 is incorrect when it says that in 1996 the theatre was listed for sale and appraisal reports were obtained. Lamadeleine first said to Rasmussen that several parties had indicated an interest in acquiring the theatre then he advised that several parties consisted of one actor from Montreal. The Gowling letter says in part:

> This has resulted in the loss of a sale and further could result in problems of refinancing and in obtaining property insurance for this valuable property.

This information is obviously untrue.

Lamadeleine acknowledged to Mr. Rasmussen that this property has been in a hazard zone since 1982 except for the time when it was taken out of the zone in 1996 for a period of time after he spoke to the Township's planner. Lamadeleine acknowledged that at no time during that time did he ever write to the insurance broker and advised him that he was in a hazard zone. He acknowledged that until the Township redrew the line in 1996, which redrawing was short lived, he was in the hazard zone notwithstanding that he had been permitted to build. Even after the Lemieux slide in 1993 he did not call his insurance broker nor did he ever advise his insurance broker of the conflicting opinions that he had with respect to the potential for landslides.

Mr. Lamadeleine acknowledged that he was familiar with the OMB proceedings, that he was present and was eventually allowed to speak at the proceedings. The decision is at Tab 140. At page 9 of the Decision the Board says the following:

> I asked Mr. Lamadeleine after he addressed me at the hearing

> why he had chosen not to seek party status. His response was that he had not really understood what that meant.

Lamadeleine acknowledged having said that to the Board. He acknowledged, however, that he had retained both Janet Bradley and Allan Cohen and that Cohen had told him that it was not appropriate for him to seek party status. He told Rasmussen that party status to him was not clear and that the municipality said that it would defend him.

It should be noted that the Board notes that Mr. Lamadeleine had the advice of counsel and that the Board is satisfied that he was given repeated opportunities to participate in the hearing. At page 10 of the report the Board notes that it is satisfied that the municipality was fully prepared to defend its by-law including the less restrictive line on the Lamadeleine property. It found, however, that the information from Mr. Lamadeleine was the central reason the line was moved and therefore the main reason for any issue between the municipality and the Authority. The Decision goes on to say the following:

> Mr. Lamadeleine had every opportunity to present his views. I am satisfied that to hear the geo-technical evidence would be an unnecessary and costly diversion. I have also found that the planning framework established by OPA 51 and by-law 25-95 represents good planning. As well it was Mr. Miguelez's evidence that the more restrictive line on the Lamadeleine property as elsewhere represented good planning in the absence of adequate site specific reports.

Mr. Lamadeleine confirmed that at the OMB hearing Jacques Whitford and Paterson were there and ready to testify.

It was Lamadeleine's evidence that when Miguelez told the Board that Lamadeleine had told him that the Authority approved of the Jacques Whitford and Paterson reports. Lamadeleine stood up to object but was told to sit down. At page 8 of the report the Board says the following:

> Mr. Lamadeleine chose not to seek party status at the first day of the pre-hearing in person following the pre-hearing through a letter from counsel and at the hearing itself through counsel. He also chose not to address me at the hearing until the very end. At that time he provided information on his frustration of the process however he provided no evidence of the effect the two different set back lines had on his interest and

Mr. Lamadeleine acknowledged to Rasmussen that he had an opportunity at the end to take Miguelez up on his statement but didn't think to do so. The transcript of what he said at the hearing was prepared by him the next day. It is located at Tab 131. The penultimate paragraph reads as follows:

> Madam Chair, I have hired the four best engineer firms there are on the market to study my land. One of these firms is Golder who also worked for South Nation. If I have all those reports plus another report from Dr. Lagarec saying my place is safe and if we remove this new line on my property back to the study line then my theatre is not safe anymore and I may not be able to get insurance.

Having said this Lamadeleine, in his evidence, acknowledged that effectively he told the Board that all four of the experts had said the building was in a safe location which is simply not so.

With respect to the OMB hearing Lamadeleine first told Rasmussen that the Board had taken a break and spoken with Paterson and Jacques Whitford. He then said that he didn't know whether this had occurred or not.

Lamadeleine acknowledged that the death nail for his business was when he was placed back in the hazard zone. It appears from the insurance policy issued after Lamadeleine advised his insurance broker of the fact that he was in the hazard zone that the policy thereafter excludes only property damage arising out of the landslide and not liability coverage. See Tab 141, although Lamadeleine declined to agree with that fact.

The business was terminated at the end of August 1997.

At Tab 65 is the application for the building permit dated September 24, 1990 showing an estimated value of construction at $398,000. The building permit actually issued at Tab 70 indicates an estimated cost of $122,000. Lamadeleine explained that the $122,000 was just for the shell. Exhibit 26 is a letter written by Mr. Lamadeleine to the Ontario Minister of Finance on February 28, 1995 complaining about the estimated fair market value being appraised in the amount of $188,000. Lamadeleine explained that he was

challenging the appraisal because he was in the hazard zone. Rasmussen, however, pointed out to him that he, Lamadeleine, felt by that time that he was home free with respect to the danger zone. Rasmussen pointed out to him that he had written in 1993 to the Township and had gotten confirmation that he was home free. Having acknowledged this he maintained his position that he thought the appraisal should be less because he was in the hazard zone.

Referring to the damages brief, Exhibit 23, and specifically Tabs 1 and 2, charges in the amount of $150,000 in favour of Ontario Development Corporation and $50,000 in favour of Prescott Russell, Lamadeleine confirmed that the plaintiff company did not own any other land apart from the land subject to these charges. He acknowledged that there is registered on title a mortgage dated July 1996 for $400,000 in favour of another of his companies, Major Prestige. He explained that there is no debt actually owing to Major Prestige but that the accountant recommended this device for some reason. Again he confirmed that he had not advanced $400,000 to the plaintiff company. The $400,000 that had come to the plaintiff company was the proceeds of the insurance company. Exhibit 27 is the mortgage from the plaintiff company to Major Prestige Enterprises Inc.

Exhibit 28 is a mortgage from the plaintiff company to Gilles Legault in the amount of $62,000. It's dated July of 1996 and Lamadeleine confirmed that the monies were actually advanced by Legault to the plaintiff company. He explained that no money was coming into the company in 1995 and 1996 and funds were required.

Referring to Exhibit 25, the trial brief of the defendant engineers, Rasmussen pointed Lamadeleine to Tab 10 which are the financial records of the plaintiff company supplied by Lamadeleine at the request of the defence. At Tab A is a document entitled budgeted financial statements for period March 1, 1987 to February 28, 1990. Lamadeleine indicated that it was hard to understand the figures shown there. It was a budget only and does not reflect what happened.

At Tab B is the financial statement for the period ended February 28, 1991 prepared by the company's accountant Sequin. The statement shows that for the 12 month period ending February 28, 1991 total sales were $134,812. Costs of sales were $53,320. for a gross income of $81,492. Indirect expenses totalled $90,493. including depreciation of $16,748. for a net loss of $9,000. When one adds back in the depreciation it appears that net income that year for the business was about $7,700.

At Tab C is the statement for the year ended February 29, 1992 showing on gross sales of $30,399. there was a real loss of approximately $17,000. for the year. At Tab D is the statement for the year ending February 28, 1993 showing on gross sales of $91,000. and a real income of approximately $25,000. after adding back in depreciation. With respect to this profitable year, Lamadeleine confirmed that the expenses do not include anything for his time. At Tab E is the income tax return for the year ending February 28, 1994 showing on sales of $89,000. real income of approximately $10,000.

At Tab F is the income tax return for the year ending February 28, 1995 showing gross sales of $30,350. which yielded a real loss of $13,000. after adding back in depreciation. It was Lamadeleine's evidence that these numbers did not correctly reflect the actual achievement of the company that year.

At Tab G is the return for the year ending February 28, 1996. The statement shows that on sales of $42,000. a real income of $24,000. was earned after adding back in depreciation. Again Lamadeleine testified that the statement does not properly reflect the business that was done by the company that year.

At Tab H is the return for the year ended February 28, 1997 which was just a few weeks after the OMB hearing. The return shows revenues of $28,000. and a real loss of approximately $7,600. Again Lamadeleine denied that this properly reflected the business activity of the company.

Marked as Exhibit 29 was a letter from the municipality to Lamadeleine dated December 19, 1995. This letter was with respect to Lamadeleine's appeal of his assessment. Lamadeleine confirmed for Mr. Rasmussen that at that time, December 1995, he told the municipality that he was still within the zone and that his property was worthless and that he would not be able to sell it or insure it and confirmed with Mr. Rasmussen that that was his view at that time.

Lamadeleine had told me that he was personally on the covenant with respect to the two charges that Exhibit 23, Tabs 1 and 2, the $150,000. to Ontario Development Corporation, and $50,000. to Prescott Russell. There was no guarantees attached to those documents and Lamadeleine does not know where such documents may be.

Lamadeleine confirmed that the policy of insurance in place at the time of the fire provided that actual cash value would be paid or replacement costs would be paid if rebuilt.

At Exhibit 25, Tab 10C at page 7, the costs of the theatre and restaurant is stipulated to be $417,000. Of that $417,000., $400,000. was obtained from the insurance. Lamadeleine was unable to say how much he would have received as actual cash value if he hadn't rebuilt following the fire. Again he confirmed that in December of 1995 he was of the view that the property was worthless because of all the landslide talk. Lamadeleine confirmed that in 1996 Mrs. Benson was interested in buying but they had never discussed price. At Tab 108, Exhibit 4, in writing to the Caisse Populaire Lamadeleine suggests that his building is worth $550,000. This is a letter dated June 20, 1996. Rasmussen suggested that Mr. Lamadeleine says whatever suits him.

Cross-Examination by Marcus

Mr. Lamadeleine confirmed that when he first called Morey to retain him Morey mentioned that he might have a conflict and said he would check it out and get back to him. Lamadeleine is unable to recall who contacted whom next. Mr. Marcus referred him to his letter to the Authority at Tab 67 which says in part:

> The engineer Randy Morey who had the work done on our land happens to be also the engineer for you too which in fact creates a serious conflict of interest since he is collecting monies from both parties at the same time which may not result in his freedom of speech and writing to express his opinion.

Mr. Marcus asked Mr. Lamadeleine why he hired Morey in the first place in 1988 and he really had no response. Mr. Marcus suggested that in saying what he did Mr. Lamadeleine was accusing Morey of being dishonest. He denied that. He explained that as far as he was concerned he had done everything Morey had recommended on the site and then when he visited the site with the municipality and the Ministry, Morey said that he had not done the work properly.

> In his letter to the Authority Lamadeleine also says:
> It has also been found that all the tests that Golder ever did in this area are questionable and need to be re-evaluated seriously.

Lamadeleine says he got that information from the municipality but is unable to show any documentation to support it.

Lamadeleine confirmed that when he asked for a building permit he got it and when he asked the municipality to move the line, they did so. They did everything he asked them to do.

Lamadeleine acknowledged to Mr. Marcus that Morey had indicated in very certain terms that the ravine would protect his building if it was built to the south of the ravine. He did not build to the south of the ravine because he wanted to try the business for a year or two in the expanded existing building to the north of the ravine.

Re-Examination by Mr. Leamen

At Tab 63 is one of the letters from the health unit. There is another letter according to Mr. Lamadeleine from the health unit advising that he may not move the holding tanks to the south side of the ravine.

Tab 49 may be one of the municipality documents that supports Lamadeleine's comment in Tab 67 to the effect that all the tests that Golder ever did in the area are questionable.

With respect to the income earned by the plaintiff company, Lamadeleine said that when he started the business he knew that it would take 8 or 9 years before there would be much profit, that it takes a long time before the business can be built up.

Filed as Exhibit 1A is a copy of Exhibit 1 which has been coloured by Mr. Lamadeleine to show the history of the acquisition. He had the entire area in his name in trust in 1982. He severed off the pink area in 1983 and put it in the name of the plaintiff company. In 1991 he severed the yellow area and sold to his neighbour having built on the north side of the ravine the year before. In 1989 he sold off the white part and in 1995 he sold off the orange piece. The theatre was initially intended to go at X on the south side of the ravine in yellow.

Evidence of Denis O'Grady

Examination-in-Chief

Denis O'Grady has been the General Manager of the South Nation River Conservation Authority since August of 1987. He has his Masters in public administration and prior to coming to the South Nation River Conservation Authority he worked for several other conservation authorities. His role is that of chief of staff and he reports directly to the Board of directors. He is, as General Manager, responsible for the day to day operations of the Authority. The responsibility of the Authority is to manage natural resources within the watershed in partnership with others, including municipalities and individuals.

He explained that retrogressive landslides have been a great issue since 1971. The Authority first got involved in the early 1980s identifying and protecting areas susceptible to retrogressive landslides. By August of 1987 when he became General Manager the Authority had just finished phase 1 of the landslide bank stabilization in Sequinsburg.

The stretch of river between Casselman and Lemieux is a major area of flow slides. Height of bank is required to create a retrogressive landslide and high banks exist between the two towns on the South Nation River.

Following Sequinburg, Lemieux, which was the next largest concentration of homes along the river, became the target of interest. Following Lemieux, the next phase was to concentrate on scattered homes between Lemieux and Casselman.

At Lemieux there were a number of options including stabilization of the slopes and buy out. The residents of Lemieux opted for buy out and as a result the Authority bought all of the residences with the use of grants from the Ontario Government and then either destroyed or relocated the homes.

At Tab 1 of Exhibit 4 is the South Nation River basin development study report 6A which contains calculation of set back lines for slopes with a factor of safety of less than 1.5. O'Grady explained that generally one wants a safety factor of 1.5 for a safe slope.

At Tab 2 is another slope stability study of the South Nation River and portions of the Ottawa River which explains the unique phenomena of retrogressive landslides in Eastern Ontario.

At Tab 3 is a letter from the Municipality of Cambridge to the Ministry of Natural Resources dated October 5, 1983 advising that the Township is currently in the process of preparing its first ever official plan and acknowledging reports that along one particular reach of the South Nation River "there is a potential for massive retrogressive landslides of the type that killed 31 persons and destroyed 40 homes in St. Jean, Vianney, Quebec." The letter also acknowledges that in 1971 a landslide in the Township destroyed 36 hectares of land over night. At Tab 5 is the Minister's response to that letter. Both those letters are in the Authority's file.

At Tab 8 is a letter from the Ministry to Mr. Lamadeleine dated November 10, 1987 which advises that official plan designations, zoning by-laws and building permits which control development, are the direct responsibility of the municipality. O'Grady acknowledged that to be the case but pointed out that if the municipality does not follow government policy, then the government will intervene. As we have already seen, this letter refers to concerns expressed by Mr. Lamadeleine about the landslide problem.

5 At Tab 11 is a letter from the Ministry to the Municipality dated January 4, 1988 with respect to the plaintiff's land. The letter notes that the property is partially within the earth flow zone and should be subject to the earth flow restrictions outlined in Section 6.26 of the draft comprehensive by-law. O'Grady explained that the Authority had a copy of that letter and knew that the plaintiff's property was in a flow zone having regard to the 600 and 800 meter set backs.

At Tab 13 is a letter from Golder Associates to the Authority dated July 15, 1988 with a proposal for a 3 phase plan. The 600 and 800 meter set backs were based on historical evidence and the Authority was hiring Golder to establish where the maximum extent of retroactive distances was. Phase 1 was to identify a study area including all houses that had a possibility for retroactive landslide. Phases 2 and 3 would be initiated once the study area had been delineated. Phases 2 and 3 would involve bore holes and sheer testing to further define the set back lines. Phase 3 would be implemented with the information gained from Phases 1 and 2 and would allow focusing of further investigations to specific locations where remedial measures were required to improve the stability of the riverbank. O'Grady explained that at this point in time the Authority was aware that the set back lines would not be uniform because the underlying geology varied.

Tab 14 is a letter from the Ministry to Mr. Lamadeleine dated August 31, 1988 enclosing a map which shows that the recommended set back line traverses his property and includes most of his bush and the site of the proposed new theatre. The Ministry also notes that a reduction or

Caselaw

modification to the extent of the earth flow area can only be determined after the completion of the Authority's study and that based on the best available information on slopes in Lamadeleine's area, the Ministry could not recommend a reduction at this time.

At Tab 15 is the Golder Phase 1 report establishing the study zone that would be concentrated on. Tab 16 is a letter from the Ministry to O'Grady advising that the MNR would be the principle agency responsible for commenting on slope stability matters in official plan, zoning by-laws etc.

At Tab 17 is a letter from the Authority to Golder dated September 14, 1988 advising that a letter has been received from Lamadeleine, that his property appears to be located within the designated earth flow zone and that the area is included in the current Casselman to Lemieux study and inquiring whether Golder could advise Mr. Lamadeleine about his proposed development.

At Tab 18 is a letter from the Ministry to Mr. Lamadeleine confirming the Ministry's understanding that Lamadeleine is engaging Morey at his own expense to conduct geo-technical testing and assessment of the landslide hazard for the stretch of river slope likely to have an effect on Lamadeleine's property. The letter further advises that Lamadeleine's application for development will be reassessed on receipt of Morey's report.

At Tab 23 is the Golder report to Lamadeleine dated November 1988 which the Authority would have received.

At Tab 24 is O'Grady's letter to Mr. Roger Brunet, Clerk of the Township of Cambridge, dated November 18, 1988. The letter is of interest in that it certainly brings home to the municipality the Authority's concern about new construction or additions to existing buildings in the set back areas. It reads in part as follows:

> Concerning the above the South Nation River Conservation Authority is of the opinion that based on present available information any further construction in the earth flow zone i.e. that area designated as sensitive slope protection with set backs of 600 and 800 meters in your comprehensive zoning by-law 144-88 is not advisable.

The letter then refers to the Golder study which is on-going and says:

> Until such time as this study is completed all new construction or additions to existing buildings should be put off.

The letter goes on to say that one of the most critical factors effecting the stability of slopes is the amount of weight added to the top of the slope which in turn increases the stress on the bank thus increasing the possibility of an earth flow or landslide. The letter closes with the following:

> The South Nation River Conservation Authority hopes that the Township of Cambridge seriously considers the above comments.

O'Grady explained that the Authority had no authority to prohibit construction and the Authority was simply telling the municipality to be careful. O'Grady explained as well that by this time the Authority knew that the potential lines were greater than 600 and 800 meters. Eventually, the line became 1 kilometer on each side of the river near Lemieux and 700 to 800 meters near Casselman.

At Tab 29 is an internal memo of the Authority dated March 15, 1989. The memo is from Graham Decow, Project Coordinator, to the executive committee directors. The memo notes that on Monday, March 13 Authority staff met with members of Cambridge Township Council to discuss a number of requests the Township had received from residents living within the designated earth flow zone for building permits. The recommendation coming out of that meeting was that until fill and construction regulations are in place for Cambridge Township and a policy statement prepared to control development, the Conservation Authority strongly recommended that building permits for any structure within the designated earth flow zone not be allowed. What is significant about that recommendation is that it came from Mr. Gratton who was, at the time, a council member of the Township of Cambridge. Again this brings home the fact that the Township would have been clearly aware of the concerns of the Authority with respect to the issuance of building permits for construction within the zone. At Tab 30 is O'Grady's letter to the municipality enclosing a copy of Tab 29.

At Tab 31 is a memo from the Ministry that was received by the Authority. It is dated March 20, 1989 and advises that the Ministry has reviewed the revised set back lines, and the supporting study report and has discussed related concerns with Morey of Golder Associates. Based on the above information the Ministry considered the set back lines shown on the map as Schedule A for the Township of Cambridge by-law 144-88 to be

sufficiently conservative to offer reasonable protection to development located outside the lines. The Ministry further advises that with the current level of information, development should not be permitted within the designated set back lines without an appropriate geo-technical investigation.

At Tab 37 is a letter from Golder to Gore & Story dated May 1, 1989 which we have seen before. O'Grady explained that with this letter Golder was making the point that not all lands located within the study area were necessarily hazardous.

At Tab 39 is the minutes of a very large public meeting presided over by the municipality on May 2, 1989.

At Tab 45 is a letter from the Authority to the Clerk of the Township of Cambridge referring to the Casselman to Lemieux study and the updated set back line. The letter is dated June 2, 1989. The letter notes that further to a discussion between the two the day before, it was the opinion of the Authority that the set backs for the earth flow or landslide potential zone as covered by the study, are those as delineated as the study area on the map prepared by Golder Associates enclosed in the letter sent to the Township dated May 25, 1989. The letter points out that this line represents not only the maximum potential retrogressive landslide area but for the Authority's purposes, will also be used as and be sufficient for, a set back for all new development. The letter goes on to read as follows:

> In other words the South Nation River Conservation Authority will discourage any and all new development within this set back area. This set back may be amended pending further studies such as the presently on going environmental study report. Until the time that these studies are completed, the South Nation River Conservation Authority will use the study area line as the set back.

Again, this was clear notice to the municipality of the Authority's position. O'Grady, in his evidence, said that there was no doubt that the Golder line encompassed all of the plaintiff's property and most certainly the theatre to the north of the ravine. O'Grady pointed out that by this point in time there was a great deal of acrimony between the municipality and the Authority.

At Tab 46 is the Authority's letter dated June 6, 1989 to all landowners in the area advising that with respect to buildings at risk, three options would be considered; firstly relocation, secondly buy-out and thirdly stabilization. O'Grady explained that had it come to pass (which it didn't) the plaintiff's theatre would not have been excluded from these options.

At Tab 48 is a letter from the municipality to the Authority dated June 13, 1989 which demonstrates the acrimony mentioned by O'Grady.

At Tab 49 is a letter from the municipality to the Authority dated June 14, 1989. O'Grady explained that at the time the municipality was taking the position that the Golder set back line was a study line only and that there was no proof of risk and was asking the Authority to remove its objection to the council's line. The Authority took the opposite view. The Authority knew that if the municipality issued a construction permit and the Authority's studies showed that the construction was within an area at risk, then the Authority would have to buy-out the construction. O'Grady explained that the Township was proposing lines closer to the river but still south of the proposed theatre site.

At Tab 51 is a minute of a meeting held June 20, 1989. In paragraphs 8 and 9 it is noted that some areas along the river may not require remedial work. At Tab 52 is the Authority's letter to Lamadeleine dated July 20, 1989 acknowledging Lamadeleine's request to participate in the Casselman to Lemieux class environmental assessment.

At Tab 54 is the Golder report to Gore & Story Limited with respect to Phase 2 of the study. This report is dated August 1989 and was used to determine preliminary cost appraisals in terms of remedial work required. Morey had been asked to give the Authority an idea of the cost of stabilization in various cross sections between Lemieux and Casselman so that the Authority could determine cost wise which was the best option, remedial work or buy-out.

Filed as Exhibit 10 was a schedule to Golder's report of August 1989. From Exhibit 10 it can be determined what the remedial proposal was for the section of the riverbank which included the plaintiff's property. If one looks at the schedule one will see along the shoreline of the river either a dark line, a hatched line or a line of dots. These represent rip rap and geo-textile, rock filled berm, or overall slope re-grading. O'Grady explained, referring to Exhibit 10, that there are two large gullies upstream and downstream from the plaintiff's property and in assessing the plaintiff's property one would have to look at the entire reach between the two gullies. I've marked the gullies on my copy of Exhibit 10. The one to the east or upstream of the plaintiff's property is actually somewhere off the map. On Exhibit 10 the set back line is the heavy dark line that I have

marked as "set back line" at the bottom of the map. As a matter of interest, at Lemieux the cost of a kilometer of berm was $500,000 plus engineering fees in 1988 - 1989. There is only one piece of rock berm required in the reach between the two gullies and it is approximately 170 meters in length encompassing approximately one half of the subject property's river front.

At Tab 55 is a resolution of the Township dated September 6, 1989. Part of the resolution at page 2 reads as follows:

> For all such site specific studies the terms of reference shall be approved by the Ministry of Natural Resources and the South Nation River Conservation Authority. The studies shall be conducted to the satisfaction and approval of the Ministry of Natural Resources and the South Nation River Conservation Authority.

O'Grady testified that he was aware of this resolution. [This resolution, which had the effect of amending Section 6.26 of the by-law establishing set back distances, clearly required the input of the Authority with respect to approving any site specific studies.] At Tab 57 is the letter from the Authority to the Township dated September 28, 1989. The letter reads as follows:

> Further to the discussion during the council meeting of September 25, 1989 research into our files indicates that the geo-technical firm Golder Associates was hired by Mr. Lamadeleine to evaluate and provide an assessment of the stability of the bank of the South Nation River.
> The study determined that the area in question was underlain by sensitive silty clays that were susceptible to flow sliding and that active erosion is presently occurring along the banks of the South Nation River. Golder's study also revealed that a portion of the property is naturally protected by the presence of two ravines which act as a barrier and would retard or terminate any local flow sides. The location of this naturally protected area is south of the existing dance hall and south of the ravine which extends east to west there. The report continues to state that if the proposed building were to be located in this naturally protected area the actual site should be approved by the geo-technical engineer.
> At no point in this report did it state that the dance hall was considered a protected area, naturally or otherwise, nor did it state that the remedial works proposed i.e. the extension and deepening of the ravine running to the south of the dance hall would protect this building.
> It appears that Mr. Lamadeleine has improved and expanded his dance hall which is in the landslide potential zone. This may have serious implications should a landslide occur.
> The South Nation River Conservation Authority would hope that all efforts are made in the future to ensure no further development occurs in this potentially hazardous area.

[In my view, this is a reasonable interpretation of Golder's site specific study and one that any reasonable person would understand.]

At Tab 60 is a letter from the municipality to the Authority requesting more specific evidence with respect to the set back line.

Tab 61 is a letter from the municipality to the Authority dated November 30, 1989 requesting a specific study by the Authority to determine early in 1990 the level of risk along those parts of municipal roads that are in the hazardous zone because the municipality intended to improve and reshape the hills on the road allowance between concessions 1 and 2. Here the municipality was asking the Authority for advice with respect to a particular site in which they had a particular interest.

The original theatre was destroyed by fire in August of 1990. At Tab 64 is a letter from the Authority to the Clerk of the Township responding to concerns that the municipality had with respect to redevelopment at the site of the summer theatre on the plaintiff's property. The Authority clearly points out that the Golder report had identified the area south of the ravines as an area where construction on the lot would be feasible and the Authority clearly tells the municipality that "redevelopment is possible here as long as the conditions outlined in the Golder report are observed i.e. construction in that area deemed safe by the presence of the ravines".

At Tab 72 is the Jacques Whitford report dated October 31, 1990. It was O'Grady's evidence that the Authority did not receive the report at that time and the Authority would have gotten a copy at some time but not at the same time as Lamadeleine because this was a private report.

At Tab 78 is the Ministry's letter to the Township dated November 21, 1990, a copy of which was received by the Authority. It advises the Township that no re-grading or protection of the river shoreline as previously advocated in the Golder report had been carried out leaving the bank susceptible to an initial failure. The Ministry expresses concerns

regarding the report of Jacques Whitford. The letter confirms that the proposed construction is north of the ravine and the ravine cannot be considered to protect the proposed structure. The letter points out that the statement in Section 6.1 of the Jacques Whitford report that instability of the riverbank is not expected to jeopardize the proposed building, does not appear to be relevant when it is apparent the firm was not provided with available information concerning the retrogressive slides in the area. The letter closes with the following paragraph:

> The area should be still considered within the earth flow designation and new developments should be discouraged.

Again, the municipality is clearly on notice.

At Tab 79 is the Paterson report. O'Grady did not know when the Authority received that report.

At Tabs 76 and 80 are supplementary reports by Jacques Whitford. O'Grady received Tab 80, the November 22, 1990 report on November 29 and was unable to say when he received the November 20th report, Tab 76. At Tab 83 is the resolution of council dated December 5, 1990 which allows construction of the theatre to the north of the ravine. The Authority received a copy of that resolution.

At Tab 89 is the Golder report to the Authority dated April 13, 1993. This is the Phase 3 report. Attached to this report is a report from Drs. M. Bozozuk and K.T. Law (B & L) whom Golder had hired to make an inquiry into the methodology being used by Golder for determining retrogressive distances. Golder, as a result of the B & L report went to method D as recommended by B & L. It was O'Grady's evidence that he did not believe that this report involved the plaintiff's land. What Morey had done was to pick out areas between gullies which he considered "best bets" for no landslides and analyze those areas with model D methodology and sheer vane testing. The plaintiff's area between the two gullies was too complicated and was not considered a "best bet".

On June 21, 1993 the biggest landslide of recorded history occurred. The maximum extent of retrogression matched the lines and estimates of Golder. The Golder set back was 750 meters and the retrogressive distance turned out to be 700 meters. As well it was noted that the retrogression did not extend past gullies. O'Grady attended at the site immediately and was able to identify Exhibit A as photos of the site. The photos were marked as Exhibit 19.

At Tab 90 is the Gore & Story final report documenting process and cost options with respect to the riverbanks.

At Tab 91 is the Authority's memo to its land and water advisory Board enclosing Tab 90 and providing an executive summary. At page 3 of Tab 91 is a table from the final report setting out certain decision zones and estimated costs in connection therewith. Decision zone 8 includes the plaintiff's property. The estimated cost of stabilizing decision zone 8 was $1,950,000. The buy-out cost was estimated at $1,106,000 and the relocation cost was estimated at $1,443,000. The Authority initially opted for the buy-out option but all of the residents wanted the stabilization option. O'Grady pointed out that the plaintiff's theatre would have been included in any buy-out or stabilization option. He went on to explain in his evidence that neither option was ever pursued because there was simply no funding for it.

At Tab 92 is amendment 51 to the official plan of Cambridge.

At Tab 101 is a memo from McNeely - Tunnock Limited to the Township's representative Oliver Mangione enclosing 4 maps showing the zoning set backs for sensitive slopes in the Township of Cambridge. Map 1 was the hazard zone as defined by by-law 72-78 prior to the geo-technical work being performed. Map 2 shows the slope protection set backs under zoning by-law 144-88 which stipulated the 800 and 600 meter set backs. Map 3 is the landslide potential set back distances under zoning by-law amendment 155-90. These are the Golder Associates set backs (study area) that encompassed all of the plaintiff's property. Map 4 is the sensitive slopes development constraint overlay under zoning by-law amendment 25-95. I have circled the plaintiff's property on this map and it is clear that the set back line excludes the plaintiff's property. O'Grady explained that initially the Authority planner and the town planner had agreed that the line on Map 4 should conform to the Morey report but at some point the plaintiff presented other reports to the town planner who accepted those reports and drew a new line. The Authority did not catch the change until it was approved and the Authority then went to the OMB and got the line changed back to include the plaintiff's property.

Entered as Exhibit 20 was a map which shows decision zone 8. The limit of that zone is the first gully to the west of the plaintiff's property and the second gully to the east of the plaintiff's property.

Entered as Exhibit 21 was the Barber appraisal relating to the plaintiff's property and estimating that the reproduction costs (new) of the theatre

would be $179,000 and of the restaurant $113,000. O'Grady explained that he believed that this was the 1989 building that was being appraised prior to the fire.

At Tab 107 is a letter from the Authority to lawyer Laviolette acting for a proposed purchaser of the plaintiff's property. The letter advises of the Golder recommendations namely the deepening and widening of the ravine and the re-grading of the slope providing rip rap protection with geotextile and cutting the top of the bank. The letter points out to Laviolette that there was evidence that the work recommended for the ravine was conducted however the theatre building is located on the north side of the ravine rather than on the south, meaning that the work conducted had no impact.

At Tab 112 is a letter from the Authority to the OMB outlining the Authority's position with respect to the municipality changing the set back line as it related to the plaintiff's property. The letter refers to technical discrepancies in the reports of the two consultants, Paterson and Jacques Whitford upon which the municipality relied. O'Grady explained that those discrepancies were that the consultants did not look beyond the plaintiff's property upstream or downstream between the gullies whereas Morey had indicated that one had to look between the two gullies to determine the safety of the plaintiff's property.

At Tab 115 is a letter from Cohen dated October 22, 1996 which O'Grady received.

At Tab 117 is the letter from the Authority's solicitor Ault to Cohen in reply. O'Grady explained that the position set out by Ault in his letter to Cohen would have been developed by O'Grady and discussed with Ault. The letter correctly sets out the Authority's position. At Tab 127 is the Authority's letter dated January 6, 1997.

Cross-Examination by Rasmussen

O'Grady conceded that the Authority had asked Golder to define the study area as broad as possible. He conceded that the issue at the OMB hearing in 1997 was where the hazard line should be drawn and that the purpose of drawing the hazard line was if an owner was going to build in the hazard zone that the owner had to get a geo-technical survey approving construction and that no building permit was to issue without a geo-technical survey.

O'Grady confirmed that if a building was already in the hazard zone the owner would not be prohibited from carrying on whatever he was doing in that building.

At Tab 22 is the Decision of the Committee of Adjustments for the Township permitting rezoning of the theatre site and a building permit for a 20 foot extension. The Decision of the Committee was effectively to allow the plaintiff to go ahead with his extension but to do so under the direction of a geo-technical engineer.

At Tab 24 is a letter from the Authority to the municipality which strongly suggests to the municipality that it not issue permits in the set back zones of 600 and 800 meters.

At Tab 26 is a letter from the Authority to the municipality dated January 6, 1989 indicating that it had no objection to the proposal with respect to the amendment of the zoning by-law for La Sucrerie because the development must occur with the approval of a geo-technical engineer. The Authority holds pretty much the same position today with the added proviso that it has delineated guidelines for future geo-technical surveys which the geo-technical engineer must follow.

[It is interesting that everything to this point in time would have been trouble free, had the building that was going to be extended been located to the south of the ravine].

O'Grady confirmed that the Authority had no objection to Paterson or Jacques Whitford as engineers but in his view they failed to look at what they should have looked at. O'Grady confirmed that the terms of reference that are now delineated by the Authority for a geo-tech survey, were not in existence in 1990.

At Tab 55 is the resolution of the municipality dated September 6, 1989 resolving that for all site specific studies the terms of reference shall be approved by the Authority and conducted to the satisfaction of the Authority. O'Grady conceded that at that time the Authority had no such terms of reference. With respect to the Golder report at Tab 89, April 1993, O'Grady explained that Golder was being challenged by other experts namely Dr. Lagarec who had been engaged by the municipality and that is why Golder got the second opinion of Bozozuk and Law who came up with a modified theory.

O'Grady confirmed that Casselman had a representative on the Authority's committees from 1985 on. O'Grady confirmed that all the Authority's information was available to any interested parties at all times.

O'Grady confirmed that he saw both the Paterson report and the Jacques Whitford report. At Tab 72 is the Jacques Whitford report to Lamadeleine dated October 31, 1990. O'Grady was not able to say whether or not the report was reviewed at about that time and whether or not the Authority sent any comments to the municipality.

At Tab 78 is the Ministry's letter to the municipality dated November 21, 1990 which the Authority received on November 23. The Ministry comments in part as follows:

> ... The statement in section 6.1 of the Whitford Report that instability of the (South Nation) riverbank is not expected to jeopardize the proposed building does not appear to be relevant when it is apparent that the firm was not provided with available information concerning the retrogressive slides in the area. The area should be still considered within the earthflow designation and new development should be discouraged.

O'Grady confirmed that anyone reading this letter from the Ministry would be aware that the Ministry was saying don't rely on the Jacques Whitford report when determining stability of the slopes.

At Tab 80 is a letter from Jacques Whitford to Lamadeleine dated November 22, 1990. The Authority's date stamp is on it and indicates that the Authority received it on November 29, 1990. It came either from the Ministry, the plaintiff or the municipality. On page 2 of the letter, third paragraph, the writer notes that the riverbank conditions immediately east (upstream) of the site are rather different and that the possibility of a retrogressive failure at that site has not been investigated. The writer also points out that a failure upstream could possibly jeopardize a portion of the present site, however, it is also noted that a ravine is present between the proposed restaurant and the east property line and that the ravine may act as a potential barrier of retrogressive failure. Rasmussen put it to O'Grady that McRostie had noted in his notes that this letter constituted a retraction of approval of location north of the gully and asked O'Grady whether he agreed. O'Grady said that it is certainly a clarification based on the Phase 1 Golder report. Whitford is now saying that he can't rule out the possibility of failure along the river. O'Grady pointed out that at the same time he is saying that the risk of a retrogressive failure jeopardizing the proposed restaurant is very low. O'Grady has trouble determining what he means by low. It should be noted that the plaintiff's evidence was that this letter was taken to the municipality.

With respect to Exhibit 10, O'Grady confirmed that Morey was suggesting three separate remedial works; firstly rip rap which is stones and which would not erode by reason of the water or ice and secondly a berm which can be put in place even if one is not worried about erosion (its weight prevents a sheer) and finally, regrading. The least costly is alternative number 1. With respect to 2 and 3 it depends on a number of factors which is more costly. O'Grady confirmed that Morey, in his site specific survey for the plaintiff, did not recommend a berm. As a matter of interest O'Grady pointed out that there are mechanisms in place in order to secure the co-operation of neighbours when work is required to the slopes of neighbours adjacent a specific site.

At Tab 105 is a letter from lawyer Laviolette purportedly acting for a prospective purchaser addressed to the Township and dated May 13, 1996 inquiring whether or not the property in question is within the Sensitive Slope Protection. O'Grady explained that the Sensitive Slope Protection area would be, at that time, whatever the geo-tech engineer was recommending. In trying to determine what was being recommended at that time, O'Grady noted with reference to Tab 101 that he believed by-law 155-90 was in the planning documents and that by-law 25-95 was proposed only. He explained that if the Authority had up to date geo-technical information which differed from an existing by-law, that was okay and the question would be answered by the Authority on the basis of the up to date information, not necessarily on the basis of the by-law.

At Tab 106 is the municipality's reply to Laviolette dated May 15, 1996 telling Laviolette that the geologist study of 1993 (Golder) confirms that the subject property is outside of the potential of landslide zone. O'Grady was unable to say whether he had received a copy of that letter. [Clearly the information given by the Municipality in this letter is incorrect. Perhaps what Brunet is telling Laviolette is that having regard to by-law 25-95 the plaintiff is outside the zone. That would make sense in view of the fact that the municipality had taken it upon itself to change the line for the plaintiff].

At Tab 107 is the Authority's letter to Laviolette dated June 12, 1996 telling her that by the Authority's definition of the area, the theatre is caught by where the Authority says the line should go.

Cross-Examination by Marcus

Mr. Marcus initiated his cross-examination by reading into the record the entire contents of the plaintiff's letter to the Authority dated October 1, 1990 which I have already referred to. It was O'Grady's evidence that he did not take as serious the plaintiff's veiled threat to sue.

At Tab 14 is the Ministry's letter to Lamadeleine dated August 31, 1988. O'Grady agreed that the letter was telling the plaintiff that the enclosed map shows that the proposed theatre site was within the set back and that the Ministry could not recommend at that time a reduction in the set back.

At Tab 31 is a letter from the Ministry dated March 20, 1989, a copy of which would have been received by the Authority. Again, the Ministry is saying that development work should not be permitted within the set back lines.

At Tab 34 is a letter from Morey to the plaintiff dated April 21, 1989 referring to the remedial work alternative chosen and carried out consisting of deepening the existing east west running ravine. O'Grady agreed with Marcus that the proposed site of the theatre is not identified in this letter.

At Tab 38 is a letter from Morey to the plaintiff dated May 2, 1989 setting out two alternative remedial works depending on the site of the proposed theatre. [Marcus was trying to make the point and I agree with him that this letter, in my view, clearly sets out the fact that to safeguard the whole property, the riverbank and slope work would have to be done as recommended and would have to be done along a stretch to be determined once the site is chosen.]

O'Grady was unable to say that the Authority received from the municipality all applications for development received by the municipality.

With respect to Tab 51 the minute of the meeting June 20, 1989, O'Grady confirmed that no one from the municipality was present.

With respect to Tab 54 the Golder report to Gore & Story dated August 1989 where it is stated at page 5 that "As a result of both of these previous studies, factors of safety are available for a relatively wide range of slope profiles throughout the study area, having calculated factors of safety ranging from about 1.0 to greater than 1.5". O'Grady confirmed that there are quite a variety of safety factors along the river slopes. As well, O'Grady confirmed that at page 11 of the report, it is noted that the results of evaluation indicate that some 60% of the total length of riverbank within the study area can be adequately stabilized by re-grading of the toe slope together with provision of rip rap and underlying geotextile.

At Tab 15, Exhibit 4, is the Golder report to the Authority dated September 1988. Figure 1 of the report shows the study area along both sides of the South Nation River between Casselman and Lemieux delineated by Golder. O'Grady confirmed that 6 copies of the report were received by the Authority. He was unable to say what the Authority did with the actual 6 copies but he did know that the report was summarized and presented to the Authority's Board of directors. He is unable to guarantee that the municipality would have received a copy of this report at the time. The hazard zone was first established by the MNR in the late 70's with set backs of 600 and 800 meters from the river's edge depending on which side of the river one was on. At Tab 101 is the memo from McNeely Tunnoch dated January 15, 1996 setting out the various by-laws and by-law maps showing the zoning set backs in Cambridge. O'Grady confirmed that the study zone in 1988 was broader than by-law 144-88 which did not encompass the plaintiff's land. The Authority objected to the line drawn on by-law 144-88 which did not encompass the plaintiff's land and the municipality complied with the objection. O'Grady confirmed that as of the Golder report in 1988 then from the Ministry's and Authority's point of view, Golder was the guide and the plaintiff's land was in the study zone as of that year. O'Grady again confirmed that in 1990 the plaintiff's land was still in the hazard zone. He explained again that the fact that land was in the hazard zone did not necessary prohibit development on the land but it did require that development could not take place in that zone unless the owner had appropriate opinions from a qualified geo-technical engineer. O'Grady confirmed to Mr. Marcus that the term "danger zone" is not used in any official document rather the term is either study zone or hazard zone.

At Tab 14 is a letter from the Ministry to the plaintiff dated August 31, 1988. The third paragraph reads as follows:

> A reduction or modification to the extent of the earth flow area can only be determined after the completion of this study. Based on the best available information on slopes in your area, we cannot recommend a reduction at this time.

O'Grady confirmed that this was the situation before the addition was built on the building to the north of the ravine.

At Tab 23 is the Golder report to the plaintiff dated November 1988 which, at page 11, states the following:

> The area of the site which is considered safe from landslide retrogression due to the presence of the ravines encompasses an area bounded on the north by the east west running ravine located immediately south of the existing dance hall building ...

O'Grady agreed with Mr. Marcus that this portion of the Golder report eliminates as a safe site, anything to the north of the ravine. Marcus suggested that one did not have to be an engineer to understand that to which O'Grady responded that one must be very cautious and that his directions to his staff always include going out with the engineer to put stakes in.

O'Grady agreed that the front page of this report does not indicate that it was distributed to the Township.

At Tab 117 is the letter from the Township's solicitors, Ault and Ault, to Mr. Cohen dated November 13, 1996. On the last page thereof the following is said:

> As Mr. Lamadeleine is aware from the evidence given at the pre-hearing on October 9, 1996 SNRCA was never advised that the line was altered between the time SNRCA approved the schedule indicating the landslide zone area and the time that the altered version was approved in council - - in other words SNRCA was not aware of the alteration or it would have appealed in a more timely fashion.

Mr. O'Grady explained that initially the Authority and the Township had agreed on a set back line with the proviso that a geo-technical study might change the line and that is what happened here, he believes. In other words the municipality purported to change the line to exclude Lamadeleine on the basis of a geo-technical report that it had received. O'Grady was not aware that the plaintiff had told the municipality that the Authority had approved of the geo-technical study.

Re-Examination of O'Grady by Mr. Leamen

Mr. O'Grady explained that he advises his staff to go to the site with the engineer because they are dealing with people's lives. So many mistakes are made as to where one is permitted to build. Geo-technical engineering is a real specialty and his staff do not have sufficient experience to interpret engineering reports. He does not want the Authority to make mistakes and end up buying the house.

Referring to Tab 101, the memo from McNeely, Tunnock with the 4 by-law maps attached, O'Grady was not sure whether or not the 600/800 meter set backs established by the province were ever adopted by any by-law. Only the municipality had the authority to enact by-laws in that respect. That set back was, however, "well known".

The first map at Tab 101 is the map attached to by-law 72-78. There was no earlier by-law that established a set back and it is difficult to tell from this map how the set back relates to the plaintiff's property. The next map is attached to by-law 144-88 which as originally drafted excluded the plaintiff's property. The next map is that attached to by-law 155-90. The hazard zone here encompasses all of the plaintiff's property. It is effectively the area that came out of the Golder report. Tab 71 is the by-law to which this map belongs and it was passed October 16, 1990. The next map is attached to proposed by-law 25-95. O'Grady explained that this was the by-law that purported to change by-law 155-90 by excluding the plaintiff's property. This, of course, is the change that the Authority successfully appealed to the OMB to restore essentially the hazard zone as set out in 155-90.

At Tab 34 is the letter from Morey to Lamadeleine dated April 21, 1989. Marcus had asked O'Grady whether or not this letter identified the proposed building location. O'Grady explained to Leamen that this letter references Golder's report 881-2486 which was the site specific report prepared for Mr. Lamadeleine and this letter and that report identifies the safe location. However, O'Grady added the caveat that he would not simply interpret the letter and the report, he would ask the engineer to take him to the site.

With respect to the municipality, O'Grady explained that the municipality of Cambridge had no geo-technical engineers on staff and therefore got geo-technical services from consultants the same way the Authority did. As well the Ministry has a geo-technical engineer available to persons such as the municipality.

At Tab 55 is the minutes of the municipality dated September 6, 1989 which at the top of page 2 says:

> For all such site specific studies the terms of reference shall be approved by the Ministry and the Authority and the study shall be conducted to the satisfaction of the Ministry and the Authority.

O'Grady has no recollection of the municipality ever asking the Authority for approval of terms of reference.

[It should be noted that we attended for a view of the site pursuant to Rule 52.05 on June 20, 2000. It was well worthwhile and assisted in the understanding of the evidence. The east west ravine is extremely substantial. It is quite deep, perhaps 20 feet deep and perhaps 20 feet across. One can easily understand that this ravine would be the southern limit of any landslide into the river. We got to the river by walking through the bush which is extremely thick and dense. We were unable to go right to the river's edge. The bank is extremely high at the front of the plaintiff's property, much higher than looking at the slope cross sections would indicate. If you went down it, you would have trouble getting back up. The theatre restaurant is in deplorable condition.]

Evidence of Guy Lefebvre

Examination-in-Chief

Dr. Lefebvre was called on behalf of the defendants Jacques Whitford and John D. Paterson. His CV was marked as Exhibit 31. He received his Civil Engineering Degree in 1965 at the University of Laval and his Masters Degree in geo-technical engineering at the same university in 1968. He received his PhD in geo-technical engineering at the University of Laval in 1970. He has done a great deal of field work in the field of geo-technical engineering on a consulting basis. He has, however, been primarily a professor doing teaching and research at the University of Sherbroke, Civil Engineering Department, since 1972. He candidly admitted to Mr. Leamen that he, unlike McRostie, Paterson or Jacques Whitford does not deal on a usual basis with everyday problems as do the other consulting engineers.

With respect to the qualifications of Dr. Lefebvre to give evidence with respect to whether or not Paterson or Jacques Whitford met the standards of the profession in preparing their reports, Leamen made an interesting argument that Dr. Lefebvre did not have enough practical experience to render such an opinion. I think Leamen's point was not without foundation but I ruled that the doctor was qualified to give me his opinions with respect to the adequacy of the reports and thereafter it would be a question of what weight I might give to the professor's evidence in that respect.

Dr. Lefebvre was retained by Rasmussen in 1999 to assess the situation. In preparation Dr. Lefebvre reviewed all the documentation and visited the site in November of 1999. He was there for approximately 3 hours and walked and observed what he had to. He looked at the ravine adjacent to the building. He walked to the river from the top through the terrace and to the bottom of the slope observing the trees and some erosion at the toe.

He had Golder's report to Mr. Lamadeleine dated November 1988 and as well had the Golder report to the South Nation Conservation Authority dated September 1988. He did not have Tab 54, the Golder report to Gore & Story, dated August 1989. He had the Jacques Whitford report to Mr. Lamadeleine dated October 31, 1990. He had the first page of Tab 75, the preliminary report from Paterson to Lamadeleine dated November 19, 1990. He had Tab 76, the letter from Jacques Whitford to Lamadeleine dated November 20, 1990. He had Tab 79, the full report from Paterson to Lamadeleine dated November 22, 1990 without the drawing on the last page of the report. He had, he believes, Tab 80 which is Jacques Whitford's report to Lamadeleine dated November 22, 1990. He had Tab 89, the report of Golder to the Authority dated April 13, 1993. He had Tab 142, the McRostie report to Soloway, Wright dated December 14, 1998. As well he had Tab 129, McRostie's report to Soloway, Wright dated January 9, 1997.

At Exhibit 25, Tab 9 is Dr. Lefebvre's report dated February 2000.

It is of interest to note that beginning at page 17 of his report the doctor acknowledges that the purpose of the report is not to fill the roll of another geo-technical engineer who would conclude on the risk of landslide and the necessary set back at the Lamadeleine property, rather the purpose is to examine if the work, conclusions and opinions delivered by Jacques Whitford Limited and John D. Paterson in response to their respective mandates were adequate and were as expected from a reasonably competent engineer.

At page 18 of his report the doctor notes under the heading Evaluation of a Safe Set Back Distance, that a slope or riverbank must first be effected by a landslide before this first landslide could retrogress inland at a certain distance from the riverbank. He points out that two aspects thus need to be examined to evaluate if a site could be effected by landslide retrogression; first the state of stability of the riverbank and second the possibility of retrogression if the riverbank is effected by a landslide.

The doctor, in his evidence, pointed out that the factor of safety of a particular slope depends on a number of parameters including the pore pressure of the water in the clay which indeed is a very important

factor. The doctor explained the factor of under drainage. When the river valley reaches equilibrium and reaches the glacial till, then the clay above drains into the till and the pore water pressure becomes much less and conversely the slope much more stable. He pointed out that Golder, in his 1988 study, installed piezometers on the west side of the plaintiff's property which indicated strong under drainage. According to Dr. Lefebvre the measurements indicated no water pressure at the bottom and if there was almost no pore water pressure then the slope would be much more stable. He went on to explain that in calculating the factor of safety, if one does not take into account under flow drainage, then the factor of safety calculation is too low.

As well as employing this numerical approach to determine the stability of a slope, Dr. Lefebvre pointed out that one also takes into consideration the site observations. For example if there are a number of big trees on the property, it means that the slope has been stable for a long time.

As well the doctor noted that at the plaintiff's site there was a terrace which protects the slope. He observed some erosion at the toe of the slope and explained that the terrace tended to protect the toe of the slope. The terrace extends along the front of the property but as it goes west it gets wider from 20 to 30 feet. He explained that the terrace protects against the fact of erosion in that there is room for erosion to occur. He noted that on the east side of the property the terrace gets narrower and narrower.

Leamen at this point quite properly complained that none of this evidence was in the doctor's report and that, as a result, the Rule was not being complied with. I decided to hear the evidence and provide Leamen with any additional time he required to consider it.

On Figure 3.2 appended to Dr. Lefebvre's report the plaintiff's property and building is identified. There is a gully to the east of the Lamadeleine property and the doctor testified that as a result it should be well drained.

Rasmussen reminded Dr. Lefebvre that McRostie had identified what he considered to be the most critical slope (see McRostie's report dated December 14, 1998 at Tab 142, plate #1). Lefebvre noted that the slope indicated there was steeper and to that extent McRostie was right. McRostie's most critical slope has a 19 degree inclination while at the plaintiff's property it is some 17 degree inclination. Lefebvre pointed out, however, that the slope identified by McRostie as most critical is not the highest slope. The slope on the plaintiff's property is a little higher. As Dr. Lefebvre put it, he would not put all his eggs in the steepest slope.

Filed as Exhibit 32 is a brief of the expert reports provided to Dr. Lefebvre and which he reviewed prior to writing his own report. Filed as Exhibit 33 is a letter from Dr. Lefebvre to Mr. Rasmussen dated April 14, 2000. In his letter of April 14th Dr. Lefebvre acknowledges that McRostie is an outstanding geo-technical engineer "well above the reasonably competent engineer". Dr. Lefebvre acknowledges the confusion about the distance from the river to the sucrerie building (McRostie talks about it at page 4 of his report) and notes that part of the confusion originates from a drawing provided by Mr. Lamadeleine on which the sucrerie building is located significantly farther from the river than it is in reality. Dr. Lefebvre does not believe as was implied in the McRostie report at pages 10, 11 and 12 that Dr. Lagarec has determined set back lines or maximum retrogression distances based only on the existence or not of trees. Lefebvre is in agreement with McRostie that the method of calculating retrogression proposed by Mitchell in 1978 is a landmark publication still applicable today but notes that McRostie nevertheless agreed "in general terms" with the Golder retrogression distance which is about twice the one which is evaluated when using the method of Mitchell 1978. Finally, Dr. Lefebvre notes that the important under drainage identified at the riverbank on the Lamadeleine property has a significant impact in the evaluation of slope stability and that it has been completely neglected in the slope stability analysis in the McRostie report (pages 6 and 7) and in the Golder studies.

Back to Lefebvre's report at Tab 9 of Exhibit 25 and in particular page 19 where he notes that for a retrogression to develop, the soil involved in a first slope failure must be sensitive so that its strength after failure would be low enough for the slide debris to flow out of the crater instead of acting as a stabilizing berm at the toe of the backscarp (the wall of soil left at the back after a slide).

Lefebvre at page 19 of his report goes on to explain that once the backscarp of a slide is left exposed, its stability is controlled by the stability number Ns which is the ratio of the weight of a soil column in the backscarp over the undrained sheer strength of the soil at the base of the soil column. Mitchell has demonstrated that the stability number needs to be at least 6 for the development of plasticity and earth flow whereas failure of vertical backscarp may develop when the stability number exceeds 4 but the height of the backscarp rapidly decreases with this type of phenomena leading to a limited retrogression distance.

Referencing Golder's report to the Authority dated September 1988 and particularly figure 24 thereof at the very back of Tab 15 entitled Stability Number, Bore Hole Locations and Historical Data, Lefebvre pointed out

that Lamadeleine's property is located between bore hole numbers 21 and 1 with the remaining bore hole numbers running downstream from the Lamadeleine property. Lefebvre pointed out that one observes a general increase in the stability numbers as one goes downstream with the increased stability numbers reflecting a greater chance for a retrogressive slide. For example, if one looks at Exhibit 7, the Ns for the 1910 slide is 9, for the 1971 slide it's 10 and for the 1993 slide the Ns is 9.6. The Ns at those sites is much greater than that at the plaintiff's property. This is confirmed in the Golder report to the Authority of September 1988 (Tab 15) where at page 16 Golder says the following:

> With the exception of site 21, near the upstream end of the study area, the calculated Ns for each site is greater than 4 which is the theoretical threshold value for an unstable back scarp and except for sites 1, 20 and 21, all near the upstream end of the study area, the calculated Ns for each site is greater than 6 which is the theoretical threshold value for possible earth flow activity.

Again Lefebvre explained that 6 is the magic number for an Ns. If it's less than 6 there may be a retrogressive slide but not a large one because one only gets the buckling of the back scarp.

At page 19 of his report (Tab 9, Exhibit 25) Dr. Lefebvre points out that the relation between the stability number Ns and the distance of retrogression based on the 41 case records examined by Mitchell, is reproduced at figure 5.1 of his report. It is noted that Mitchell has included two South Nation slides, the 1910 slide and the 1971 slide. It is interesting to note that for the 1910 slide on the South Nation River, for a Ns of 9 the actual retrogression of the 1910 slide was about 1,000 feet whereas Mitchell would have estimated it to be 2,000 feet according to figure 5.1. Dr. Lefebvre's point is that it is worthwhile to note that these empirical co-relations significantly over estimate the retrogression distance for the two landslides of the South Nation River documented by Mitchell.

At page 21 of his report, Dr. Lefebvre addressed the location of the proposed building. Dr. Lefebvre points out the following. The determination of the location of the proposed building was not part of the three site specific geo-technical studies performed at the Lamadeleine site (Golder, Paterson and Jacques Whitford). The location of the proposed building was provided by Mr. Lamadeleine. See the location plan included in the November 1988 Golder report (figure 4.1) referenced by the note "Plan Supplied by R.C. Lamadeleine". The plan supplied by Lamadeleine indicates a set back distance from the river of 1,156 feet measured parallel to the property line and not along the shortest distance to the river. The location plan in the Jacques Whitford report (figure 4.2) has been recopied but obviously from the same plan provided to Golder by Lamadeleine. The set back distance from the river is indeed 1,156 feet and still measured parallel to the property lines. The location of the Lamadeleine building can be verified using the detailed plan included in the 1993 Golder report to the Authority. This plan has been obtained from aerial photographs. The portion of the plan in the sector of the Lamadeleine property was reproduced at Lefebvre's figure 3.2. The distance from the river measured parallel to the property line is not 1,156 feet or 352 meters but rather 250 meters or 100 meters less than indicated on the plan provided by Mr. Lamadeleine. The shortest distance of the building to the river is, in reality, 180 meters (figure 3.2) as compared to about 240 meters when evaluated on the plan provided by Mr. Lamadeleine. The Paterson report did not include any location plan but stated in the first paragraph that "The site is located 340 meters from the crest of the slope". Lefebvre comments that a distance should normally be expressed as the shortest distance otherwise it has no meaning. The distance of 340 meters from the crest of the slope represented a set back of about 400 meters to the edge of the river.

At the bottom of page 21 of his report Dr. Lefebvre addresses the drainage of the slope at the riverbank. It was his evidence that there was good under drainage at this point of the river. The doctor notes that none of the three site specific geo-technical studies have included the installation of piezometers to measure the pore water pressure at depth in the sole at the riverbank vicinity. Again, Lefebvre expresses the opinion that this information is necessary for slope stability analysis. The doctor notes that at the time of these three studies the regional Golder study of September 1988 was available and it included a boring put down in the north west corner of the Lamadeleine property in which three instruments or piezometers had been installed to measure the pore water pressure. In Dr. Lefebvre's opinion the Golder pore water measurements at the crest of the riverbank in the north west corner of the subject property indicated a very good state of drainage in the slope, typical of under drained clay deposit and in his view the clay deposit is drained by an under layer of sandy soil discharging freely into the river valley. Again in his view a strong under drainage is a favourable condition which should be accounted for in slope stability analysis.

With respect to McRostie's theory relating to an ice dam, a sudden rising of the river level, a failure of the ice dam and a quick draw down, it was Lefebvre's view that a rapid draw down can be critical if the water has been damned up for 3 or 4 months because by that time the slope will have

obtained equilibrium however if the situation lasts for only a few days perhaps 5 or 6, then the slope has not reached equilibrium with the river and when the dam breaks, it has very little effect. Lefebvre is of the opinion that McRostie's scenario would have a very small effect on the stability of the slope. Lefebvre is critical of Morey and McRostie in that as far as he is concerned, they have assumed critical pore water pressure and have not taken into consideration the under drainage.

At page 24 in the last paragraph thereof, Dr. Lefebvre says the following:

> ... According to Mitchell and Markell (1974) and Mitchell (1978) which was in 1988 and 1990, as it is today, the state of the art in landslide retrogression the maximum distance of retrogression would be 150 meters considering an Ns value of 5.5. Even considering the maximum Ns value of 5.8 evaluated at a depth of 12 or 13 meters in the east boring, the maximum distance of retrogression would be 180 meters. Using an Ns of 5.9 Golder arrived at a retrogression distance of 340 meters, which again, for reason of safety was increased to 400 meters to represent a safe set back distance.

Marked as Exhibit 34 was a report prepared by Mitchell in 1978 for the Ministry of Transportation and Communications. This report consisted of an analysis of the 1971 landslide and the proposed formula for retrogression. In Table 1 under the introductory portion of the report, both the 1971 slide and the 1910 slide on the South Nation River are identified. Figure 14 to the report is a reconstructed section of the 1971 landslide. On the issue as to where the retrogressive distance was measured from Dr. Lefebvre was of the view that Mitchell was measuring from the water's edge. The distance from the water's edge having regard to figure 14, was approximately 490 meters. If measured from the crest which is the highest point of the slope or the point where it starts to slope to the river, then the retrogressive distance is 370 meters. Dr. Lefebvre pointed out that if one goes back to Table 1 in the report, it is indicated that the 1991 slide retrogressed 490 meters. By the same token if one goes to Exhibit B, the 1973 report of Mitchell and in particular Table 1 thereof, landslide 35 is identified as the 1971 South Nation River landslide. If one goes to Table 3 of this report, the distance of retrogression for landslide number 35 is 1,600 feet which equals 490 meters. On the basis of all this then, Lefebvre was of the view that in using the Mitchell method the retrogressive distance is from the river's edge and not from the crest. It should be noted that at this point Exhibit B was made Exhibit 35.

At page 25 of his report, Dr. Lefebvre addresses the John D. Paterson report. The doctor notes that in its slope stability analysis, Paterson used a very conservative condition for the ground water with a water table at surface and horizontal flow (RU=0.6). Paterson evaluated a factor of safety of 1.4 which in fact is identical to the overall factor of safety of 1.4 evaluated by Golder in his November 1988 report. Lefebvre comments that the John D. Paterson report added however an important statement to the effect "This analysis was conducted using excessively high pore water pressure conditions that are likely never to develop in the slope". Lefebvre comments that this statement was correct and more so considering the strong under drainage of the riverbanks existing at this site.

Lefebvre points out that the Paterson reports concluded that:

> Based on the results of this study, it is the opinion of this firm that the slopes bordering the South Nation River at this particular site are not, in their present conditions, considered to be unstable. It is also our opinion that should a failure of the bank occur, it would not retrogress back to the location of the proposed building.

At page 26 of his report, Lefebvre quite correctly points out that the Paterson report does not contain any details to support the conclusion that should a failure of the bank occur, it would not retrogress back to the location of the proposed building. Lefebvre notes that the Ns values evaluated in the 1988 borings would yield a maximum distance of retrogression of 150 meters or, at the most, 180 meters using state of the art criteria. Lefebvre notes that the true distance of the Lamadeleine building from the river was 180 meters but as mentioned before, the three engineering studies were induced in error on the building location by the location plan information provided by Mr. Lamadeleine. The Paterson report placed the building 400 meters from the river edge (340 meters from the crest) which constitutes a safe set back even when considering the conservative Golder criteria. The Lamadeleine building located on the erroneous plan is at 240 meters from the river and thus further from the river than the 180 meters distance of retrogression evaluated with state of the art criteria.

In any event, based on all of the available information Lefebvre is of the opinion that the conclusions of the Paterson report conformed to the state of the art and as expected, from a reasonably competent engineer faced with the same mandate.

At page 26 Dr. Lefebvre deals with the Jacques Whitford report. He begins by stating that in his view the November 22, 1990 letter constitutes a very strong reserve about the stability of the site. Lefebvre points out that as shown by the scope of work described in their October 31st report, Jacques Whitford had understood its mandate as concerning essentially the bearing capacity at the proposed building site and the slope stability at the adjacent ravine.

Lefebvre does point out however that the Jacques Whitford report did nevertheless mention that the stability condition of the South Nation River was not of concern:

> It is not expected that instability of the riverbank will jeopardize the proposed building at the location investigated.

Again, the report does not detail the basis for that comment. Lefebvre points out that the Ns values evaluated in the Jacques Whitford boring at the building location would yield a maximum distance of retrogression of 130 meters using state of the art criteria. Lefebvre comments that such a distance of retrogression was indeed much less than the set back of the building as shown on the erroneous plan to Jacques Whitford (240 meters) or even appreciatively less than the true set back of 180 meters.

Lefebvre felt that the 3rd paragraph on page 2 of the Paterson report was very significant. It notes that the riverbank conditions immediately east of the site are rather different and that the possibility of a retrogressive failure at that site had not been investigated. The paragraph points out that a failure upstream could possibly jeopardize a portion of the present site. Lefebvre said he found this paragraph of particular significance because existing conditions are always important.

Lefebvre notes that in the letter sent to Lamadeleine on November 22, 1990, Jacques Whitford used careful wording and expressed strong reservation and in the end warned of the need for a new assessment of the overall stability if the condition of the riverbank changed in the future.

In the final analysis, Lefebvre was of the view that the Jacques Whitford comments on slope stability and distance of retrogression were correct and conformed to state of the art analyses. He felt that the careful wording and strong reservation expressed in the report reflected that the Jacques Whitford work to fulfil its mandate had not been directed toward the stability assessment of the riverbank and that in the circumstances Jacques Whitford conducted itself as reasonably competent engineers.

Lefebvre was asked about McRostie's comment that there were sheer strength values in the Paterson report which, if used, would increase the retrogressive distances. Lefebvre commented that Paterson did not use vane strengths as measured on site. Paterson, rather, measured in the lab from samples taken in shelby tubes. Shelby tubes, in his view, usually cause the material to become softer and lose strength. Mitchell, on the other hand, uses field sheer strength.

Cross-Examination of Lefebvre by Paul Leamen

On cross-examination Lefebvre advised Leamen that in preparing his report he examined all of the documents listed on Exhibit 32 and attended at the site where he walked the crest along the river and inspected the terrace of the slope and walked east approximately 200 meters to look at the big gully. To the west he looked to the road, a distance of several hundred meters. As he walked he examined the slope and the trees for any signs of erosion.

At no time before preparing his report did he speak to either of the defendant consulting engineers.

Leamen asked Lefebvre why in the face of the stated purpose of his report at page 17 (to examine if the work conclusions and opinions delivered by the defendants in response to their respective mandates were adequate and as expected from a reasonably competent engineer) why did he walk the site? Lefebvre responded that when doing an evaluation of anything you like to see the subject of your evaluation and that it makes a lot of difference when you see it. He agreed with Leamen that it is not enough to simply read material. He agreed that walking to the east and the west of the actual site was at least useful, if not necessary. When asked to agree whether any reasonably competent engineer retained to do a slope analysis would do the same thing, Lefebvre waffled and said yes and no, explaining that if the building was far enough from the river, there was no necessity to walk the site. Mr. Leamen pointed out that all of the engineers were talking about the same building on the same piece of land and again invited Lefebvre, given that fact, to agree that any competent engineer would do the same as he did and that is walk the site in an east and westerly direction. Again Lefebvre waffled and said it was not that clear how far the building was from the river. Leamen then asked if Lefebvre was suggesting that because it was not clear how far the building was from the slope, it was alright for someone not to do the walk that he had done. Lefebvre pointed out that Paterson did look at the riverbank and did some surveying of the slope.

Lefebvre agreed that at the time Paterson and Jacques Whitford did their reports, it was unclear how far the building was from the river and that the knowledge that they had was not accurate, knowledge being from the drawing in the Golder report.

Leamen asked Lefebvre whether a reasonably competent engineer would be expected to determine for himself the distance from the building to the river for the purpose of analyzing the slope. Lefebvre replied that if it was in their mandate to do so then such would be the case.

Lefebvre then backtracked to some extent. He declined to admit that it was not clear what the distance was when the defendants did their reports. He said that they and indeed Golder felt they had the correct distance and in fact did not.

Lefebvre confirmed that the correct distance is 180 meters but if you scale the drawing the drawing makes it approximately 240 meters.

At Tab 79 is the Paterson report. At the last page thereof is a drawing with Paterson's seal on it showing the scale of 1 to 1000. Leamen asked Lefebvre whether since there is a drawing by Paterson to scale, one would expect them to locate the building correctly. He then indicated that the drawing was wrong and the building was not at the right location when one looks at the drawing. Leamen asked him why the consultant would not be expected to get it right to which Lefebvre responded it was copied from Golder, it was wrong and they didn't know it was wrong. He added that they should not be expected to determine the distance if it's already in a pre-existing report. He added that consultants are not in the surveying business.

Leamen asked Lefebvre whether he agreed that the mandate of Paterson and Jacques Whitford was to do whatever was necessary for the purpose of giving a report to eventually lead to the issuance of a building permit. It was Lefebvre's evidence that he did not understand this to be the case with respect to Jacques Whitford, certainly not with respect to the delivery of their first report. He conceded, however, that in their subsequent letters, November 20 and 22, it was clearly for a building permit. With respect to Paterson he conceded that from the beginning Paterson would have known that he had to look at the slope for the purpose of the issuance of a building permit. He conceded as well that both Paterson and Jacques Whitford knew that the building permit related to a combination theatre and restaurant that would accommodate many people.

When asked whether he agreed that the South Nation River between Casselman and Lemieux was an area prone to retroactive landslides, Dr. Lefebvre responded that in his view only the downstream portion was prone to retroactive landslides. [This notwithstanding that there are three landslides directly adjacent to Lamadeleine's property which is in the upstream portion.] Lefebvre did concede to Leamen that the most critical time for a retrogressive landslide to develop on the river is in the Spring time and that likely the critical time would be the same time that the building was getting maximum use. He conceded that a reasonably competent engineer would be expected to exercise more care assuming all the above was known. He conceded that when human life is at stake, then one is expected to take more care. He then retracted from that and said that if he had known the use of the building he would only expect the engineer to use normal care.

Lefebvre conceded that the soil in the riverbank is sensitive enough that one should be careful. He conceded that if the soil is sensitive then one must ask whether there is a likelihood of initial failure but added the caveat that if the retroactive distance is not great enough then that is the end of the inquiry.

When asked to agree if the initial failure is likely to occur when the slope is steep when opposed to not steep, he responded that the critical cause of a landslide is erosion and if there is no trace of erosion then it is not critical. He then conceded that the steepness of the slope does indeed have something to do with the possibility of failure. He added that "steep" in terms of the jargon used is 20 degrees. The slope on the plaintiff's property is 16 to 17 degrees and the McRostie "most critical slope" is 19.2 degrees.

Dr. Lefebvre was asked if he knew whether Paterson or Jacques Whitford had determined the possibility of an initial failure other than on the plaintiff's property. He replied that Jacques Whitford did no slope stability analysis at all. Lefebvre was asked whether a reasonably competent engineer asked to comment on slope stability for the building would be expected to do some analysis and he responded that Jacques Whitford did not consider it part of its mandate.

Leamen pointed out to Lefebvre that at page 7 of its report at Tab 72, Jacques Whitford said the following:

> The stability condition of the Nation River located approximately 350 meters north of the proposed restaurant is

not of concern. It is not expected that instability of the riverbank will jeopardize the proposed building at the location investigated.

Leamen asked Lefebvre whether a reasonably competent engineer in saying that would be expected to do a slope analysis. Lefebvre completely avoided the question by saying that Jacques Whitford was saying that the building was far enough away from the river that the stability of the slope did not matter although he conceded to Leamen that the building was not 350 meters away but rather half that distance, 180 meters. He was asked whether considering the true distance, he agreed that Jacques Whitford should have done a slope analysis. Lefebvre responded in the negative saying that would not be necessary if Jacques Whitford is convinced on the wrong evidence. He pointed out that if Jacques Whitford did as he did, then the simple answer is that one doesn't have to worry, the state of the art computation yields 150 meters and the building was at 240 meters, almost 100 meters outside the retrogressive distance (at least as far as they knew from the Lamadeleine distance).

Lefebvre did concede that if Jacques Whitford knew that the information that he had from the Lamadeleine map was wrong then he would be at fault. Leamen asked Lefebvre whether if Jacques Whitford knew the building to be 200 meters from the river, should Jacques Whitford have done a slope analysis? Lefebvre answered that he did not know on what basis they went in terms of distance. Leamen pointed out to Lefebvre that at Tab 80, Jacques Whitford letter of November 22nd, the first paragraph refers to the South Nation River being located some 200 meters north (shortest distance rather than measured parallel to the property line) from the building site. Lefebvre agreed that at this point Jacques Whitford knew that the 350 meter distance was wrong. Leamen suggested to Lefebvre that the real distance being 180 meters Jacques Whitford got it wrong for the second time. Leamen asked whether that would be consistent with the responsibilities of a reasonably competent engineer and Lefebvre provided the same stock answer, that is, that the Lamadeleine drawing in the Golder report was at fault. Lefebvre then pointed to his report at Exhibit 25, Tab 9 and particularly figure 2 thereof, which is the Golder map with a recorded distance of 1,156 feet of set back from the river to the building taken parallel to the east west boundary of the property. Again he said this was the source of all of the confusion. He agreed, however, that anyone looking at the map would realize that this was not the shortest distance to the river. He conceded that it is not the way to express the distance to the river and any reasonably competent engineer would know that. Lefebvre agreed with Mr. Leamen that in that sense that distance is simply not relevant for geo-technical purposes. Lefebvre pointed out that on this drawing the distance is 240 meters if scaled. He conceded to Leamen that Jacques Whitford did not do what he should have done in terms of expressing the distance.

With respect to Tab 80 the Jacques Whitford letter of November 22, 1990 to Mr. Lamadeleine, Lefebvre agreed with Leamen that this letter was done for the specific purpose of determining the stability of the riverbank with respect to the building. Leamen asked Lefebvre whether in the circumstances one would expect a reasonably competent engineer to do a slope analysis. Lefebvre responded by saying that there were so many reservations in this letter of November 22nd that obviously Jacques Whitford did not want to go very far into it and what Jacques Whitford is saying is that a retrogressive landslide cannot be ruled out. Leamen pressed the matter and said that given Jacques Whitford knew the report was for a building permit, what is Jacques Whitford saying? Is he saying it's stable enough for a building permit or not? Lefebvre then made a startling revelation. He said that he would be surprised that they got a building permit with this report in that this report does not say it's fully safe and there are very strong reservations.

Leamen asked Lefebvre whether he was saying that with the reservations expressed, Jacques Whitford had no obligation to do a slope stability analysis. Lefebvre replied that Jacques Whitford thought it was finished with the report and then they were asked another question. They were not expected to do another whole study. He commented that this letter shows that they were not doing a slope stability analysis.

Lefebvre conceded that initially Jacques Whitford was required to determine the strength of the soil at the building site and the stability of the adjacent ravine. In that respect they concluded that the building should be set back from the ravine some ten meters. Then secondly they were asked to comment on the slope stability. Lefebvre agreed that this was as equally a critical question to answer as the first in relation to getting a building permit and perhaps it was even more important.

Leamen put the question to Lefebvre "what if it turns out that Jacques Whitford did good work with respect to determining the soil strength at the building site and the stability of the ravine but with respect to the slope stability analysis they did nothing but walk the site? Is that the work of a reasonably competent engineer?" Again Lefebvre evaded the question by responding that Jacques Whitford simply responded to its mandate. Leamen suggested that if Jacques Whitford was asked to give an opinion as to the stability of the riverbank, it would have to do at least as

much work as it did with respect to the strength of the soil at the site and the stability of the ravine. Again Lefebvre evaded the question by saying that Jacques Whitford would not do it just for nothing.

Leamen asked Lefebvre whether from his own examination of the site and the building, was there any gully protecting the building from a landslide. Lefebvre responded that the east west gully behind the building does not protect it and there is no east west gully in front of the building which would protect it. Lefebvre agreed then that there was no gully that he saw that would protect the building from a retrogressive slide. Leamen then referred Lefebvre to Jacques Whitford's letter of November 22, 1990 at Tab 80 and the third paragraph thereof which reads in part as follows:

> We noted that the riverbank conditions immediately east (upstream) of the site is rather different. The possibility of a retrogressive failure at that site has not been investigated. A failure upstream could possibly jeopardize a portion of the present site. However it is also noted that a ravine is present between the proposed restaurant and the east property line. A ravine such as the existing one may act as a potential barrier of retrogressive failure.

Leamen asked Lefebvre whether when he viewed the site he saw any such ravine. Lefebvre responded that there was a large ravine 200 feet to the east but that there was no ravine on the plaintiff's property or nearby that would protect the building from a retrogressive landslide.

Leamen then reviewed with Dr. Lefebvre the Paterson's report at Tabs 75 (preliminary report) and 79. Lefebvre agreed that from a reading of these reports, there was no doubt that Paterson had the mandate to comment on the stability of the slope and the risk of retrogressive landslides. Leamen asked Lefebvre whether, in the circumstances, he would agree that if Paterson was a reasonably competent engineer, he would have attended the site in the face of that mandate. Lefebvre responded that this could involve teamwork. Perhaps someone else such as a technician could attend the site. He commented that a very experienced technician is probably better than a young engineer at that point. Leamen pointed out to Lefebvre that Lefebvre attended the site and Lefebvre explained that if he wanted to criticize someone else's work then he should go to the site. Leamen asked Lefebvre to agree with him that if the person who signed the reports had never been to the site, then he was not a reasonably competent engineer to which Lefebvre responded that if the signatory was relying on someone who was qualified then that would be okay. It was Lefebvre's evidence that he agreed with Mr. Leamen that he would expect who ever did have a look at the property would also look on each side of the property. Leamen asked Lefebvre whether if the person who did visit the site did not look on each side of the subject property, then that would be negligence. Lefebvre responded that when in the field one can see much but if the particular individual simply didn't look then that is much different. Leamen inquired as to how far one might be able to see at the site with all of the large trees and Lefebvre thought perhaps 100 meters would be fair. Leamen asked him if this would be far enough and Lefebvre responded "I guess so".

With respect to the bore hole that Paterson drilled at the building location, Leamen inquired of Lefebvre as to why they would not have bored the hole closer to the slope. Lefebvre professed not to know but did point out that Paterson would have had the Golder report with the bore hole on the east side. Leamen asked Lefebvre why, if they were doing a slope analysis, they would bore the hole up near the building. Lefebvre pretty much gave a non answer saying that if the building was on rock there was no problem but they needed to know the condition at the building site. They dug the bore hole where they did in order to determine the nature of the soil.

Leamen asked Lefebvre what Paterson had done once he got the results from his bore hole. Lefebvre responded that Paterson knew there was soft clay there and a risk of retrogression depending on the distance. Lefebvre was unable to say whether he analyzed the retrogression distance. Leamen asked Lefebvre what was the purpose of the bore hole if there was no analysis of the bore hole results and Lefebvre said he didn't know.

Leamen had reminded Lefebvre of McRostie's evidence that he had done an analysis of the Paterson bore hole test. He again asked Lefebvre what, as far as he knew, Paterson had done with his own bore hole test. Lefebvre responded that Paterson assessed that there was soft clay below the building and then Paterson had to say whether the building was far enough away from the river. If the soil had been strong, that was the end of it. Leamen asked Lefebvre whether he had seen anything in the Paterson reports to show what Paterson concluded from the bore hole. He replied that, as far as he could see, they determined that the building had been constructed on clay. Lefebvre did not know how Paterson had evaluated the retrogressive distance. Lefebvre did not agree with Leamen's suggestion that if Paterson had done the analysis that McRostie did, the retrogressive distance would be 380 meters. Lefebvre pointed out that Paterson did not have a field vane test and therefore could not do the analysis from their own bore hole data using the Mitchell formula. They

had, rather, to use the Golder data with the Golder field vane test. Lefebvre agreed with Leamen that the Mitchell formula was different from the Golder formula explaining that Golder wanted an approach that was very much on the safe side but the criteria is still the Mitchell report in terms of published formula. In other words, Mitchell is the only published formula but Morey has his own approach. He then explained that he did not know what formula Paterson used but in any event the retrogressive distance that they got is correct according to the Mitchell report. Lefebvre confirmed that the Mitchell approach has a solid data base and a solid fundamental basis namely, that with a stability number between 4 and 6, the possibility is a non flow retrogressive slide and with a stability number of 6 plus, the possibility is for a flow slide.

Referencing his own report at Tab 9 of Exhibit 25 and particularly figure 5.1, Lefebvre explained that Mitchell used most of this data to develop his formula. He was unable to tell Leamen whether Mitchell included all of the known retrogressive distances on the South Nation River in figure 5.1. At Tab 15 is the Golder report to the Authority dated September 1988. Table V thereof sets out 4 different formulas for estimating retrogressive distances. Lefebvre agreed that method D is the Mitchell formula and the closest bore hole site listed to the plaintiff's property is the third one down, 1 / 2. Leamen pointed out that the estimated retrogressive distance at that bore hole site using the Mitchell method is 125 meters but historical data shows that the actual retrogressive distance is 200 meters. Leamen put the question "how come". Lefebvre's answer was that we do not know when that slide occurred and referenced figure 24 in the Golder report, Exhibit 34. Lefebvre conceded that Mitchell in his computations had not included in his study the 3 landslides in the vicinity of the plaintiff's land, that is the 2 across the river and the one on the same side of the river further to the west, notwithstanding that if one looks at an air photo one can see those landslide scars. Lefebvre conceded that the existence of those slides could be relevant information because they could lead one to the conclusion that the clay there is susceptible to failure and accordingly the retrogressive distance would have to be determined.

Leamen asked how 2 retrogressive landslides across the river with retrogressive distances in excess of 200 meters could be ignored to which Lefebvre responded if they happened 2000 years ago "so what".

Lefebvre testified that it was quite possible that Morey is correct in saying he sees one to five failures every year on the South Nation River. Leamen pointed out to Lefebvre that if there is under drainage and at the same time there were slides in 71 and 93 then obviously the under drainage had been overcome. Lefebvre explained that if there is erosion eating away at the toe then at sometime it must fail but if the slope is stable, then the under drainage makes a big difference and must be accounted for.

Lefebvre confirmed to Mr. Leamen that the terrace on the plaintiff's property narrows as it goes to the east and also the steepness of the slope increases as one goes to the east. Leamen asked Lefebvre whether he would agree then that as one goes to the east from the plaintiff's property, there is an increased possibility of initial failure and increased risk of retrogression. Lefebvre agreed that that would be the case where there is erosion. He agreed as well that as the terrace narrows there is a bigger chance of retrogression because less reserve is being offered for erosion.

Lefebvre agreed that if the public safety is an issue then that would be a reason for an engineer to be more careful.

Finally, Leamen closed his cross by putting this question to Lefebvre. If the land is unsafe, could one or two reasonably competent engineers have done their work competently by saying that it is safe? Lefebvre answered that if it is clearly unsafe and the engineer unequivocally says that it is safe, then he is incompetent.

Re-Examination by Rasmussen

Rasmussen asked Lefebvre whether two competent engineers could arrive at different conclusions. His response was in the affirmative. He pointed out that if the study was done down stream then probably all of the three consultants (Golder, Paterson and Jacques Whitford) would reach the same conclusion. However, if the risk is very small, there may be a degree of conservatism resulting in different opinions.

Lefebvre had testified on cross that the Golder procedure is not wrong for Golder's purpose. Lefebvre explained to Mr. Rasmussen that Golder's purpose was to establish the potential for a risk.

At Exhibit 25, Tab 9, Lefebvre's report figure 2, is the "Lamadeleine drawing". Lefebvre explained that when telling Leamen the distance that he had walked west, he would have with reference to figure 2, walked to the Forest Road which is the west boundary of the property.

Rasmussen asked Lefebvre what use could be made of the distance of 1156 feet shown on the Lamadeleine drawing assuming it was presented to

him contained in a report. Lefebvre replied that that known distance could be used to get the scale of the diagram and assuming that distance was correct then other distances could be calculated. Lefebvre pointed out that the marked distance of 1156 feet is in error by 100 meters. In other words, 1156 feet equals 352 meters and the actual distance from the building down to the river is 250 meters. As well, the shortest distance to the river is 180 meters as compared to 240 meters when one scales it on the Lamadeleine plan assuming the 1156 feet is correct.

Jim Nault

Examination-in-Chief

Mr. Nault is a property specialist with Co-operators Insurance. In 1990 he was an independent adjuster with Renault Senecal and dealt with the Lamadeleine fire. The insurance policy had been issued through Reed Stenhouse. The claims file no longer exists but Mr. Nault has a recollection of the events in 1990.

Reed Stenhouse had asked him to investigate, assess and settle the fire loss. The cause of the fire was undetermined.

The extent of the insurance coverage was $400,000 on building, equipment and stock and there was a replacement cost endorsement on the policy. The plaintiff decided to reconstruct. The initial payment made by the insurers was for actual cash value and as Lamadeleine proceeded to reconstruct he presented invoices to Mr. Nault which Mr. Nault reviewed and then gave to the insurers with a recommendation for payment. In all, the entire limits of the $400,000 coverage was paid out.

Cross-Examination by Marcus

Mr. Nault confirmed that everything including the building and the equipment inside was destroyed in the fire, even the old slab was condemned.

Re-Examination by Leamen

Mr. Leamen asked how the $400,000 policy limits related to the total cost to which Nault replied that there was sufficient funds to rebuild everything and to replace all of the equipment, much of which was used equipment.

In the circumstances, I permitted Rasmussen to re-cross on the re-examination.

Cross-Examination by Rasmussen

Mr. Nault confirmed that the $400,000 was entirely adequate to cover the replacement of the building and all of the equipment in it. There was some used equipment purchased. Mr. Nault remembers specifically that all the seats that went into the theatre were used.

Ubald Boileau

Examination-in-Chief

Mr. Boileau has been a roofer, renovator and demolisher for the last dozen years. At Tab 11 of Exhibit 23 is his estimate of the cost to demolish the building. He anticipated it would take 6 to 7 men two weeks to take down the building at a cost of $21,750 plus GST for a total of $23,272.50. He would expect to recover 30% salvage which he would try to sell or recycle.

Cross-Examination by Rasmussen

The witness was at the site in 1992 or 1993 for a meal. He had never attended the theatre.

When he made his estimate in May of this year he did not go inside the building.

Mr. Rasmussen directed the witness to Exhibit 24, the original appraisal and he was able to confirm that the building had steel siding and a steel roof. He also confirmed to Mr. Rasmussen that for the estimated demolition cost he got only the building materials. He did not get the air conditioner, the seats or the tables and chairs. Effectively his was an estimate of the cost of demolition of an empty building.

Cross-Examination by Marcus

When Lamadeleine called to ask him to make an estimate as to the cost of demolition, Lamadeleine explained that he had to consider demolishing because the South Nation River Conservation Authority had shut the business down. He could not operate it anymore because of the landslide.

Norman Lemay

Examination-in-Chief

Mr. Lemay has been a real estate appraiser since 1971. In 1993 he was consulted by Mr. Lamadeleine to appraise the sucrerie. At Exhibit 23, Tab 3, is Mr. Lemay's letter to Mr. Lamadeleine dated July 19, 1993 and his appraisal.

What Mr. Lamadeleine had requested was an appraisal of the depreciated cost of the property.

Mr. Lemay inspected the property. He measured the outside of the building, recorded the composition of the walls and roof (all steel). He noted aluminum windows and on the interior vinyl tile, rugs, plywood, gyprock and a soft wood finish. The building was heated by forced hot air and electricity. There was a central air conditioner plus additional wall units, an alarm system and a sprinkler system. The building appeared to be of recent construction and was in good shape.

Mr. Lemay used the Marshall and Swift approach to determine the cost to construct the building. He explained that Marshall and Swift have a publication that shows pictures and costs. Using this approach Mr. Lemay determined that the cost to replace the building would be $721,000. To this figure Mr. Lemay applied a 30% depreciation factor (5% for observed appreciation and 25% by reason of the fact that Marshall and Swift provide city prices and this is was a rural property). The net costs of depreciated replacement was $505,000.

Mr. Lemay appraised the value of the land at $100,000., the value of the terrace, bridge and sugar cabin at $15,000 and the value of the well, septic system and parking lot at $20,000 for a net depreciated cost of $640,000.

At Tab 14 of Exhibit 23 is Mr. Lemay's letter to Mr. Lamadeleine dated June 5, 2000 where he expresses the opinion that because of the landslide problem and the extremely limited use that the land may be put to as a result thereof, the land is probably worth no more than $450 an acre. He expressed the opinion that the building does not increase the value of the land again because of the landslide problem.

Cross-Examination by Rasmussen

Mr. Lemay was never at the site prior to 1993 and has not been there since.

Mr. Lemay conceded that there are three approaches to determine the value of a property. Firstly the income approach, secondly sales comparisons and thirdly depreciated replacement cost which was the method that he was asked to use. He did not do an income approach evaluation or a sales comparison because the latter was impossible to do.

Mr. Lemay was aware that construction people would not use the Marshall and Swift approach but rather would do a more detailed cost approach.

With respect to the land, what we are dealing with here is 8.9 hectors which equals approximately 18 acres.

With respect to page 4 of his report at Tab 3, Exhibit 23, Lemay testified that he got the figure of $11,000 per hector by looking at comparables although he had no record of the comparables that he looked at.

With respect to Tab 14 of Exhibit 23, Lemay's letter of June 5, 2000, Lemay determined that the land was in the retrogressive landslide zone by talking to the Authority. He had not spoken to the Authority in 1993. Rasmussen pointed Lemay to Tab 101, Exhibit 4 and the map that shows that in 1993 when he did his appraisal, the entire Lamadeleine property was within the hazard zone. Lemay conceded that in 1993 he did not realize that the plaintiff's land was included in the landslide zone and the comparables that he used at $11,000 per hector were not in the landslide zone.

Lemay confirmed that he puts the reduced value of the land down to the fact that it is in a potential landslide zone and has no use. As he put it, even the cows would disappear.

Aside from his appraisal in 1993 and his letter of June 2000 to Lamadeleine, Lemay admits that he has done no other work on properties along the river.

Lemay was finally able to come up with some comparables which were marked as Exhibit 37. They are purportedly all low potential lands and interestingly enough appear to be put on the market at values that are

approximately the same as what Lemay says Lamadeleine's lands are now worth. For example, there is a 25 acre parcel up for purchase at $12,500 ($500 an acre), 43 acres for sale for $10,000, 100 acres for sale for $35,000 and 210 acres for sale for $60,000.

Cross-Examination by Marcus

Marcus put to Mr. Lemay that if the plaintiff's land was in the hazard zone in 1993 and it is still in the hazard zone, what is the difference in its value today as opposed to 1993. Lemay first replied that one cannot build on the property any more and cannot get insurance on the premises. When pressed by Marcus, Lemay admitted that there is no prohibition against building if one has a report of an engineer saying its okay to build.

Marcus asked Lemay what he would have done if he knew in 1993 that the property was in a hazard zone and he responded that he would have asked to see the engineering studies. He has not yet seen them to this date.

Lemay does not know why Lamadeleine wanted the appraisal in 1993. He conceded that this Spring Lamadeleine asked him to tell him what the value of the property was, if it was in the landslide zone and dangerous and if he could not get insurance. Lamadeleine, in giving him instructions, told him that he could no longer carry on his business because he couldn't get insurance. He did not say the municipality or the Conservation Authority had closed down his business. Lemay confirmed that it was his view in 1993 that the septic and the well could be replaced for $20,000.

Finally, Lemay confirmed that the appraisal is for the building only and does not include the equipment.

Re-Examination by Leamen

None of the comparables in Exhibit 37 are in landslide areas because there are no sales in the landslide areas.

Rita Benson

Examination-in-Chief

Mrs. Benson has been a caterer for 8 years and in 1992, 1993 and 1994 she worked as an employee of the plaintiff preparing meals in the months of March and April. She estimates that 10,000 to 12,000 people came for meals. She was closed on Monday and opened the rest of the week for lunch and supper.

In 1995 and 1996 she rented the restaurant from the plaintiff and operated the business for herself carrying on the same business as before. It was her evidence that business was good. The arrangement was that she paid rent to the plaintiff and she kept the revenue from the meals.

At some point in time she thought about purchasing the business. She was in business for herself as a caterer, was lacking space and wanted to buy a larger place. She did not, however, purchase the sucrerie because the plaintiff could not sell because of a dangerous zone situation. Accordingly, she purchased something else.

Cross-Examination by Rasmussen

Mrs. Benson was probably interested in buying the whole property including the bush, the theatre and the other buildings, depending on the price. However, no price was ever agreed upon. She is still in the catering business and has bought another property for her business.

She paid her rent to Mr. Lamadeleine and does not recall whether she paid by cheque or by cash and whether it was payable to Mr. Lamadeleine or the company.

At Tab 105 is solicitor Laviolettes's letter to the Township of Cambridge advising that her client is interested in purchasing the subject property and asking confirmation that the property is not "within the Sensitive Slope Protection".

The letter is dated May 13, 1996. Mrs. Benson knows Ms. Laviolette and confirmed to Mr. Rasmussen that she never hired Laviolette to do anything for her with respect to possible purchase of the property.

At Tabs 106 and 107 are the responses from the Township of Cambridge and the Conservation Authority to Ms. Laviolette. Mrs. Benson has never seen these before nor did Ms. Laviolette ever communicate with her about the plaintiff's property in 1996.

It was around the end of 1996 or the beginning of 1997 that Lamadeleine told her that he could not sell his property to her. He said it

was in a danger zone and he could not sell. He did not say that it was a danger zone that existed because the municipality had declared land along the river as a study or hazard zone. He simply told her that it was a danger zone.

Ms. Benson testified that she never asked the plaintiff to make any inquiries with any financial institution to determine if there was any money available to Mrs. Benson to assist in the purchase of the property.

Lamadeleine never showed her any appraisal of the property nor did she ever ask for one, nor did she ever have one done.

It was he who first approached her to tell her that he was interested in selling the property.

Before 1999 she operated her catering business out of her home. She bought a property in May of 1999 in Casselman in the industrial park and paid $130,000 for it.

Roland Landry

Examination-in-Chief

Mr. Landry owns Landry's Restaurant Equipment in Cornwall. He has been buying and selling new and used restaurant equipment for 27 years. Ten to fifteen years ago he started doing evaluations for lenders.

At Exhibit 23, Tab 10 is his evaluation of Lamadeleine's equipment prepared December 7, 1999.

Previously Landry had attended at the sucrerie on two occasions with family and friends to have a meal and see the play. It was his evidence that both times the place was packed.

In December of 1999 Mr. Lamadeleine asked for a replacement appraisal of his equipment and how much he, Landry, would offer to pay.

His appraisal came to some $56,788. He explained that this would be for both new and used equipment. If he could not replace the equipment with used, then he would replace it with new.

It was his evidence that if all of Lamadeleine's equipment were to be sold at a fire sale, he would purchase it for $6,000 and wouldn't pay more than that for it because of the cost of storing it.

Cross-Examination by Rasmussen

Mr. Landry was able to confirm that he has sold to Lamadeline a lot of the equipment that he presently has and that it was used when he sold it to him.

He confirmed as well that many of the things in his evaluation Lamadeleine could sell himself and get a lot more than he would pay him.

Cross-Examination by Marcus

The condition of the equipment was very good in December of 1999 and anyone interested would grab it up.

Sylvain Desjardins

Examination-in-Chief

Mr. Desjardins is an industrial sound designer and technical consultant. He has a diploma in sound engineering from the Ontario Institute of Audio Recording Technology. He is presently employed by Specs Audio. He is fully aware of new and used audio prices for the purpose of bidding.

On November 17, 1999 he attended at the site to do an evaluation to determine the cost to replace the theatre equipment. At Exhibit 23, Tab 8, is his evaluation totalling some $78,900 including the turntable whose value was given to him by Lamadeleine at $20,000. His appraisal was conditional on the condition of the equipment which he did not test.

It was his evidence that the actual value that might be obtained on the sale of this equipment was approximately $13,000. He commented that the equipment was pretty old.

Cross-Examination by Rasmussen

The witness did not take an inventory of the equipment nor was it his intention to be too detailed. Tab 8 is the only written record he has of his evaluation.

He charged Lamadeleine for 3 hours of his time at $45 an hour for a total of $135. He had never done business with Lamadeleine before.

He was asked by Rasmussen what the cost of the equipment would have been in 1990 assuming it was all new and he was not able to say so.

He explained to Rasmussen that the $78,900 cost was the replacement price to change everything in the building to new.

Cross-Examination by Marcus

The lighting was not obsolete although the lighting console was very old and the sound console would have to go. It was his evidence that with some exceptions they "don't make this stuff anymore".

Peter Forest Donnelly

Examination-in-Chief

Mr. Donnelly has been a general contractor since 1985 specializing in restaurant and dental offices. He does new construction and renovations for both residential and commercial properties.

At Exhibit 23, Tab 9 is his estimate for replacing the building, the parking and the outside patio.

He had previously attended at the sucrerie prior to his estimate dated December 5, 1999, approximately 3 to 4 years ago in the springtime when he had an excellent meal and there were many people there.

As of December 5, 1999 he determined the replacement cost of the building to be $609,346 and testified that it would probably be 12% more today. He estimated the cost to replace the parking to be $52,000 plus GST and the cost of rebuilding the outside patio to be approximately $12,000.

Cross-Examination by Rasmussen

The cost to replace the building $609,346 plus GST of $42,000 for a total of $651,000 did not include kitchen appliances but did include the 600 amp service with 2 sub panels, 2 natural gas furnaces, 2 central air conditioners, a sprinkler system, etc.

The price also included three holding tanks which Mr. Lamadeleine said were there. In this respect the witness recounted that in 1997 he obtained a permit for constructing a restaurant with holding tanks and in doing so dealt with the Eastern Ontario Health Unit. He explained that holding tanks are cheaper to install than septics for a building of this size. He calculates that it would cost $35,000 to $40,000 today for a septic system for that particular building whereas holding tanks cost approximately $3,000 per tank.

Cross-Examination by Marcus

The witness has known Lamadeleine since 1996/97 and has RRSPs invested with him.

When Lamadeleine asked him to prepare a replacement cost estimate, Lamadeleine told him that he had found out that he was in a landslide zone and he wanted t know if he were to build the building in another location, how much it would cost. It was the witness' evidence that it would be impossible to relocate the existing building to another site due to its size.

That concluded the plaintiff's evidence apart from the reading in of questions and answers from discovery pursuant to the rules. Marked as Exhibit 40 is a record of the questions and answers that are taken to be read in by the plaintiff pursuant to Section 31.11(1) and additional questions that I have marked in black ink to be read in at the request of defence counsel as qualifying answers pursuant to Rule 31.11(3). I explained to counsel that in my view plaintiff's counsel was not to be taken to approbate the answers that I required him to read in pursuant to Rule 31.11(3) but that I would receive those additional answers to qualify or explain the part first introduced.

Read in from Transcript of Examination for Discovery of Herve Francois held on March 11, 1999

Mr. Francois is employed by the defendant the Township of Cambridge from June 1995 to October of 1998.

There was no municipal planner from 1989 all the way to 1995. During that time all of the responsibilities that Mr. Francois took on in 1995 were done by the clerk.

Anything that had to do with Mr. Lamadeleine's application to build the sucrerie in 1988 and when it was replaced in 1990 would have been the responsibility of the chief building official Mr. Andre Brisson who was there from 1988 to 1997. The issuing of the building permits would have been reviewed by Mr. Brisson as the building inspector.

At Exhibit 4, Tab 124, is a report on the sucrerie. That document was prepared by this witness at the request of counsel in order to give them a history of the file on the Lamadeleine property.

The whole history of the by-laws concerning sensitive slope were very mixed up through the years. 155/90 was certainly one of the by-laws. The witness believes that it was attempted prior to that by-law to alleviate some of the concerns of the citizens but the other by-laws didn't pass.

We may assume that by-law 144/88 was the first by-law that had anything to do with slope stability in the Township of Cambridge.

It appears as though 155/90 was the first one that really came to grips with the issue. It established the set back distance and also put in place a mechanism to notify the Conservation Authority when there was a request for a permit. The by-law applied to the South Nation River between Casselman and Lemieux, an area that included Mr. Lamadeleine's land. The by-law established an area on the basis of on-going studies from years past and also from landslides that had happened along the riverbanks.

This witness identified in a chronology all of the documentary evidence he had or the municipality had in its file that was in any way relevant to this case and it is fair to say from a review of the documents that the municipality always knew that the sucrerie was going to be constructed to the north of the ravine.

The municipality received reports of the geo-technical engineers, Paterson and Jacques Whitford. They had been reviewed by council in 1990.

To the witness' knowledge, permits have not been issued by the municipality within this area designated as a study hazard zone since that time.

The geo-technical reports in 1988 from Golder would have been presented directly to council and council would have reviewed them. There was nobody on staff that had the qualifications to review them in terms of their engineering.

The municipality takes no position on whether the site actually is or is not safe.

Read in from Transcript of Examination for Discovery of Steve Gauthier held on November 4, 1999

Mr. Gauthier is the planner of the Nation Municipality that includes the former Township of Cambridge. Mr. Gauthier was presented to complete what began as the examination for discovery of Herve Francois. Mr. Gauthier eventually replaced Mr. Francois. He was present on the day that Mr. Francois was answering the questions.

Mr. Brisson is presently an inspector in Plantaganent [Brisson was never presented as a witness for the municipality during the course of the trial although he is obviously available].

> Question 93: Well, you got the report of October 1988. We've already discussed that. What else did you get from Golder to show that what was required by the municipality was actually done.
> Answer: Well, Golder made a study saying that it was safe on the south if you extended the ravine. He extended the ravine. Golder approved it, but - - -
> Question 98: My understanding of what we've accomplished here is that we don't really know the answer to the question. We don't know what approval was given by anyone to actually show these conditions were met. Is that fair?
>
> Answer: Yes.

Read in from Transcript of Examination for Discoveryof Raymond Hache held on August 12, 1998

Mr. Hache is the manager of the geo-technical group of Jacques Whitford Limited.

Prior to 1990 Jacques Whitford had not done any work along the South Nation River.

Jacques Whitford holds itself out as an expert in geo-technical work including the assessment of risks of retrogressive failure and is one of the best in Canada as it was in 1990, although it was not in 1990 familiar with the type of studies that were going on along the South Nation River.

At the time of retainer, Jacques Whitford was aware that there had been a building on the river side of the gully and that Lamadeleine wanted to build a new building on the same side of the gully.

The Jacques Whitford report is marked in Exhibit 4 at Tab 72 and is dated October 31, 1990.

Question 135: Now it's the next sentence that concerns me here.
"The stability condition of the Nation River located approximately 350 meters north of the proposed restaurant is not of concern.
"Now, in order to write that in this report what assessment, if any, had been done by you.
Answer: The only assessment that had been done is a visual inspection of the site by Charles and Charles had - - that touches upon that assessment below where he looked at the erosion condition at the site and he didn't feel that they were of any significance. The other assessment that he would have done is the trees that were covering the site as well that the entire site was treed and the distance was very significant.
Question 138: Right. Other than a visual inspection, which is something I suppose even I could do, could you tell me what he relied upon to make that statement?
Answer: The visual inspection of the site, actually you do have to have some expertise in slope stability and in the geo-technical field in order to come and say no, this is a site that I don't need to do a slope stability analysis on so it isn't necessarily something that anybody can make. Anybody can inspect but to make the assessment does require some background knowledge.
Question 139: So are you telling me that as far as you know Mr. Kwok made an eyeball assessment of the slope and concluded that it was not necessary to do anything further.
Answer: I believe that is the case. Now I can't say for sure because I wasn't there with Charles.
Question 140: Would you also ask Mr. Kwok to tell me exactly what it was he did. If he did do an eye ball assessment, where was it done? In other words was it done at one location on Mr. Lamadeleine's property or more than one, was it done on anyone else's property, were there any measurements at all taken of any sort?
Answer: I can answer some of that for you if you want me to right now and I can tell you from the records that we have, he did walk the full length of the property. He did go take a look at the slope because he's providing us some comments on the slope as well, the total slope. He did not take any measurements of any cross sections of the slope. He looked at it visually and made an assessment based on his professional expertise.

The following is a summary of additional evidence read in from the examination for discovery of Hache.

It was Jacques Whitford's expectation that Mr. Lamadeleine was going to take the letter of November 1 to the municipality with a view to getting a building permit. (That is the Jacques Whitford report dated October 31, 1990 at Tab 72).

Jacques Whitford obtained the Golder report, Exhibit 4, Tab 23, before November 20.

The Golder report was given to Jacques Whitford by Mr. Lamadeleine. Charles read the Golder report and Mr. Hache read sections of it. As a result of reading it they looked at the equations that had been proposed and prepared their letter of November 22 (Exhibit 4, Tab 76).

Before either the November 20 or November 22 letter was sent out, Charles and Mr. Hache returned to the site and looked at the site and reviewed the Golder report in detail.

We have a report from Golder who investigated in some detail the slope stability of the Lamadeleine property in 1988 and concluded that there was a significant risk of retrogressive failure. The witness on discovery is

Caselaw

telling Mr. Leamen that on the basis of a visual assessment, Jacques Whitford reached a different conclusion.

At this point counsel for the defendants asked me to have read in questions and answers 264, 265 and 266 under the Rule and I so directed. Those answers disclose the following. Jacques Whitford's conclusions which differed from Golder were based on looking at the toe of the slope and again they felt the toe of the slope was stable as they looked at it. Their visual observation of the grade of the slope led them to believe that this was a slope that was stable at the toe, that is with regard to the initial slide. The second component they looked at was the vegetation and they felt that with that vegetation there retrogression wouldn't happen anyway.

> Question 272: Go over to page 10, the last sentence of the first paragraph says that it's Golder's opinion that a significant portion of the clay material in the slope is susceptible to flow siding. Do you agree or disagree with that?
> Answer: Again we agree with that. We did agree with that, and that's why we didn't say - - we wouldn't say that it's not an issue at a site like this, it has to be considered as an issue.
> Question 273: So do you agree a significant portion is susceptible to flow sliding?
> Answer: The nature of the material yes we agree with that we agree with that nature.

In recounting what his firm did before it issued its report of November 22, the witness testified as follows. They went to the site, they reviewed the reports, they drew some conclusions about the type of soils that were there and agreed with Golder that the nature of these soils under the right conditions should not be ruled out and that's what they decided. They couldn't rule it out that these soils were of that nature. Then they decided to look at the conditions on the site with a cursory review similar to what Golder had concluded or stated at one point, that a visual review would be required in order to assess whether or not ... (See answer to Question 300)

No one at Jacques Whitford ever spoke to anyone at Golder before issuing its two reports.

> Question 415: Mr. Hache, is there any distance from the river on Mr. Lamadeleine's property that you would say a location of the sugar shack is unsafe?
> Answer: I haven't looked at that. I would have to work something out with the profiles and everything else. I haven't done that.

Read in from Transcript of Examinations for Discovery of Stephen J. Walker held on August 12, 1998

Mr. Walker is the president of the defendant John D. Paterson and Associates Ltd.

The person who did the field work on the subject lands was Neil Mutcher who was a technologist and who was no longer with the firm.

Mr. Walker was aware that since the slide of 1971 there had been ongoing studies of the South Nation River.

The Paterson firm holds itself out as an expert in the area of geo-technical work.

Lamadeleine in his letter to Paterson asked for testing of his land to put a building to know if it is safe and also to check the river slope because there is a lot of discussions going on about the Nation River. To make a long story short find out if it is safe to put a building. The total price quoted for the work was $3,000. Mr. Walker confirmed that Mr. Lamadeleine's instruction was to address the slope stability issue with respect to the siting of the building and whether or not it was a safe distance away from the slope. Defence counsel requested the read in of question 73 which I directed.

> Question 73: By safe distance does that mean that it wouldn't be, ... does that mean an assessment of the risk of retrogressive land slide to that point?
> Answer: It's an assessment of the risk to the building in itself which is not to say there couldn't be a retrogressive failure that might go halfway to his building or whatever, the question is is the building a safe distance away?

Walker was aware that Lamadeleine wanted to reconstruct a building on the river side of the gully.

Walker did not attend at the side when the retainer was obtained. Neil Mutcher, the technologist went to the site. He supervised the drilling

operations, recovered samples for testing and took some measurements on the slope.

Prior to the report that Paterson issued and Walker signed, Walker had never been to the site.

At Tab 79 is the Paterson report dated November 22, 1990. There was a preliminary letter that went out before the report.

The significance of the slope analysis was to determine the potential for an initial slope failure and in that respect, Paterson did work only on Mr. Lamadeleine's property.

Question 126: Was there only a risk of progressive slope failure from Mr. Lamadeleine's property or would you agree that the risk was elsewhere as well?
Answer: With any slope there's always risks, it's everywhere.

Rasmussen then requested that questions 127 to 132 be read in and I so directed. In those questions the following was disclosed.

In Walker's opinion the risk of a slope failure was most likely on Mr. Lamadeleine's property. Mr. Walker conceded there is "neighbouring development" there but there are surficial features such as gullies and that that seem to come into play. Notwithstanding that, no one from Patersons went on to other peoples land to do their work because they didn't feel it was necessary based on the results of their stability analysis of the slopes, the soil conditions, the ground water conditions that existed and the technical data that they obtained. All that told them that the chances of a failure were slim.

Question 192: Is there a distance at which Paterson would say that it was not safe to construct a building?
Answer: If we were asked to define the line on the property it can be done. We weren't asked to do that, we were asked to deal with the building and is it safe and the answer is yes.
Question 193: And in reaching that conclusion what was the distance between the building and the shore that Paterson was using?
Answer: Down the center line of the property and everything seemed to be relative to the center line of the property we did spell out a distance in our report.

Question 194: 340 meters?

Answer: Yes. That's down the center of the property.

Question 199: Do you know whether or not the building is actually located closer to the river than 340 meters?

Answer: Yes it is.

Question 200: Would you agree with me it's approximately 170 meters?
Answer: I don't know the distance, probably of that order.
Question 201: Did you ever do any calculations to determine the distance to the closest point of the river?

Answer: No we didn't.

Question 209: What is the slope then at 170 meters from the building or the closest point of the river to the building?
Answer: That would be the closest point where the pen is.

Question 210: Is that on Mr. Lamadeleine's property?

Answer: No.

Question 211: Do you know what the slope is at that?

Answer: Taken no measurements.

Paterson always knew based on the plan that the building was not 340 meters from the river but they never actually physically measured that distance on the neighbouring property. They did appreciate that the distance was approximately 170 meters when their report was being done or of that order.

Sometime during the period that Paterson was doing its work, Lamadeleine made them aware of the Golder report referring to his property and provided them with a partial copy of it.

Paterson appreciated that its report was going to be used for the purpose of obtaining a building permit.

Leamen closed the case for the plaintiff by filing as Exhibit 41, two resolutions of the municipality in 1988 and 1989.

Steven Walker

Examination-in-Chief

Mr. Walker is the president of the defendant company John D. Paterson and Associates Ltd. He graduated in 1978 from Queens University in geological engineering. He has been employed by Paterson since then. His work is primarily geo-technical engineering and Paterson specializes in geo-technical engineering. The company works across Canada. Before 1990 the company had done work along the river and they were aware of the situation with respect to landslides. They were aware in 1990 that Golder had been retained by the Authority with respect to a study along the river but had never seen any published reports. Filed as Exhibit 42 were the notes of his associate Mr. Stewart. The notes are dated October 9, 1990 and record a call from Conrad Lamadeleine. He notes that mention is made of landslides in nearby places and there is a distance quoted "1200 feet from river". Nothing came of the call at that time.

Exhibit 43 is a note made by Stewart on November 6, 1990 again recording another call with Lamadeleine. The understanding was that Lamadeleine was putting up a new building some distance from the river and wanted a bore hole sunk and wanted to determine soil condition under the building and if it was a safe distance from the slope. In this memo it is noted that the building is 1250 feet from the river.

At Tab 74 is a letter that was received November 8, 1990 whereby Paterson was retained by Lamadeleine. The letter says in part:

> Testing my land to put a building to know if it is safe also to check the river slope because there is a lot of discussion going on about the Nation River. To make a long story short find out if it is safe to put a building.

My notes indicate that Paterson had ceased working in the area of the river in 1983 but in any event Walker's evidence was that he undertook the project on behalf of Lamadeleine and dispatched forces to the site.

Walker himself did not go to the site but rather one of his technologists, Mulcher, was sent. It was Walker's evidence that Lamadeleine told the technologist where to put the bore hole and Lamadeleine provided the technologist with a copy of the site specific Golder report. The technologist was to examine the condition of the slope and to take some survey cross sections of the slope. Walker explained that in order to properly assess the slope one must know the geometrics of the slope including height and angle.

Walker identified Tab 23 as the Golder report that was received by Paterson. At Tab 23 is the site specific Golder report to Lamadeleine dated November 1988. Walker testified that they did not receive this report in its entirety. Refer to page 156 of the report. It was Walker's evidence that they received a similar drawing but not one which showed the location of the bore hole. As well the title of Golder Associates was missing. Walker confirmed that Paterson did get the log for bore hole #1 in the north east corner of the site and the text of the Golder report.

Exhibit 25, Tab 4 are the field notes from Mulcher's observations and survey measurements on November 15. On the 3rd page thereof is a sketch of the site indicating slope 1 in the north east corner of the lot and slope 2, some 78 meters west along the bank. The sketch shows bore hole #1 as being the Paterson bore hole.

At page 1 of Tab 4 is the information from the nite with respect to slope #1. Information with respect to slope #2 was on the back of the first page of Tab 4 and is in as Exhibit 44.

It was Walker's task to review the information when it came back to him from Mulcher together with the bore hole information which is also contained in Tab 4.

Beginning at the third last page of Tab 4 is a computer generated print out of slope stability analysis which produces a critical failure circle and a lowest factor of safety. It was Walker's evidence that their analysis using conservative assumptions and high pore water pressure produced a factor of safety of 1.4 which he considered quite satisfactory. Other information available at the time was the Golder bore hole results, and the mapping of the area by the Ministry of Natural Resources showing factors of safety.

At Tab 75 is Paterson's letter to Lamadeleine dated November 19, 1990. The first paragraph refers to the structure being located greater than 340 meters from the crest of the South Nation River. Walker got this distance from the drawing that originates from the Golder report showing the distance to be approximately 1200 feet as the distance from the ravine to

the river. He was aware at the time that it was parallel to the property line. He did not compute the shortest distance. When asked by Rasmussen why he used the distance from the drawing in the Golder report, he replied when reviewing the Golder report it seemed to be the distance that was being discussed.

It was Walker's evidence that he had some discussions with Lamadeleine prior to the letter of November 19 and before they did the work. There were no discussions with any other people up to the point of this letter.

The second paragraph of the letter refers to factual data that has been used to assist Paterson in its analysis. Walker explained that the factual data allowed Paterson to confirm that the soil condition at the theatre was similar to the bore hole of Golder near the slope. They relied on the Golder bore hole to provide soil information down near the river.

The letter of November 19, 1990 goes on to say that after reviewing the data in the Golder report and on the basis of Paterson's findings, it is Paterson's opinion that the proposed development complies with the concerns that have been expressed regarding development along the South Nation River. Walker testified that the concerns being referred to were that there was a study area that did not allow development unless there was confirmation of safety by way of a site specific study. As well there had been preliminary information from the Authority setting out set backs.

In any event, by this time Walker had determined a factor of safety against rotational failure of 1.4 and was satisfied with that. In arriving at a factor of safety of 1.4, he assumed full hydro-static saturation with horizontal flow or other words, high porewater pressure which was unlikely to develop. In fact, if the porewater pressure drops, then the factor of safety goes up. In other words, they assume the worst porewater pressure of .6. It is more likely, according to Walker's evidence that it would have been significantly lower, perhaps .4. That would raise the factor of safety significantly from 1.4 to perhaps 1.7 or more.

The last paragraph of the letter of November 19th states that Paterson's calculations indicate that the proposed structure is set back a distance that is more than adequate to buffer the structure against a possible slope failure should it occur. With respect to this paragraph, Walker explained that when they have an FS less than 1.5 they take a failure circle back into the slope until they get an FS of 1.5. Having done so they got back 10 meters, ignoring retrogression. Walker explained that they did not expect any retrogression because the factor of safety was so good there would not be an initial failure to begin with. In other words, in their opinion, there would not be an initial failure and without that they need not consider retrogression.

At Tab 77 is the typewritten paragraph authored by Lagarec with Lamadeleine's handwritten note "this is important in order to obtain my building permit but it gives you plenty of room". Walker testified that Lamadeleine sometime between the letter and Paterson's formal report, brought that document in indicating that he needed the paragraph in the conclusion of the report. Walker remembers nothing else of the discussion.

At Tab 79 is Paterson's final report. At page 3 in the first full paragraph the report states what Walker was essentially saying in his evidence, that is, that while the Golder report addresses the theory behind retrogressive slope failures which is of particular concern between Casselman and Lemieux, for a retrogressive type failure to occur an initial slope failure is required. Paterson's calculations indicate that the factor of safety against an initial rotational failure occurring is in the order of 1.4 which is considered to represent a marginally stable slope condition and that analysis was conducted using excessively high pore water pressure conditions that are likely never to develop in the slope.

The report at page 3 goes on to state that based on the results of the Paterson study, it is the opinion of the firm that the slopes bordering the South Nation River at this particular site are not in their present condition, considered to be unstable. Walker testified that by "present condition" he was referring to the fact that nature has a way of changing the condition of a slope. As well, human activity can change the condition of a slope.

In the last paragraph of the report the following is stated:

> We have reviewed the Golder Associates report #8812486 and agree that there is always the possibility of landslides occurring along the South Nation River; however, after examining the site conditions (i.e. gullies, slopes, etc.) and the lands being forested and well drained, it is our opinion that the proposed building is sufficiently set back from the river so that should a failure occur, the building would not be adversely effected.

With respect to the information contained in this paragraph, Walker testified that he would have gotten from the technician the fact that the lands were forested and well drained and he also knew from the Golder

report that the porewater pressure was not in fact what they used in their calculation. In other words, they used a higher porewater pressure. Walker testified as well that the reference to the property being well drained would have come from the information from the bore holes both Golders and Patersons.

At the second last page of the report is a document entitled Simplified Bishop Slope Stability Analysis which is produced by a computer program. It relates to slope #1 and shows the circle of slope failure with a factor of safety of 1.4. I had Walker explain this to me and I noted on my copy of the analysis at Tab 79 that in the event that one assumes a factor of safety of 1.5 then the circle of failure goes back into the slope a further 10 meters.

Walker has been to the site on two occasions. Firstly in December of 1996 with respect to the OMB hearings and secondly a day before he gave his evidence at this trial. He has not changed the opinion as expressed in the letter and the report. On both occasions he walked the slope on the property from one cottage to the other and his observations on those two occasions satisfied him that the information he had was representative of the site. He saw no changes in the slope between 1996 and the day before giving his evidence that caused him any concern but he did qualify that statement by saying it was hard to see the day before.

Walker explained that his technician had taken samples of clay in shelby tubes and thereafter took sheer vane strength measurements at the lab. This is different from field sheer vane strength in that field sheer vane strengths are typically higher. It is commonly known that lab sheer vane strengths are lower.

Cross-Examination by Leamen

It was Walker's practice in most cases to send out a technician for slope analysis. Once the geo-tech engineer gets the field results back, if he thinks it appropriate then he will go out. There were 4 or 5 licensed geo-technical engineers with the firm at the time and about a dozen technicians including Mulcher.

Walker knew that the purpose of the report was to enable Lamadeleine to get a building permit for a restaurant theatre which would see high use in the springtime. He conceded that it was an important and responsible task that Paterson undertook.

He instructed Mulcher to confine his investigation to the plaintiff's property. They do not like to trespass on other property without permission. They never asked permission from adjoining land owners to go on their property and indeed they had no interest in seeing the adjoining property unless they could see it from Lamadeleine's property. Although they knew that the land which was closest to the river was not on the plaintiff's property, in their opinion retrogression was not a problem and therefore they restricted their investigation to the plaintiff's property. Walker conceded that the risk of initial failure has nothing to do with the property lines.

Walker conceded that one of the parameters in dealing with initial failure of the slope is the steepness of that slope and that it was accordingly relevant to know whether the plaintiff's slope was steeper or not when compared to the neighbour's slope.

Walker confirmed that he knows today that the closest slope is 170 to 180 meters from the river. He was asked by Leamen if he knew anything about the closest slope and he answered that he only checked slopes leading to the plaintiff's property. He was asked how far past the Lamadeleine property he had gone. He answered that he did not know precisely but said perhaps 200 feet.

Walker has seen the McRostie reports. He confirmed that he had received McRostie's report which is at Tab 129 and that he read it. Leamen suggested to Walker that he saw in the report that it was McRostie's opinion that the most critical slope was to the east of Lamadeleine's property. Walker responded by saying that McRostie had qualified that statement. Leamen asked Walker whether even to this date he had looked at that slope and Walker replied that he did not think McRostie had identified the actual location of it so that he did not know whether he had seen it or not.

Walker confirmed that the factor of safety of 1.4 as calculated was based on slope measurements taken by his technician. He was asked by Leamen whether if the slope to the east is steeper, that might change the factor of safety. Walker conceded that it could, if all other factors were the same.

Walker conceded that his report identified the fact that the slope had marginal safety at 1.4. If the factor of safety had been 1.3 there would have been more risk. He conceded that the lower the factor of safety the more the concern. He conceded that 1.4 indicated marginal safety but still he did

no calculation of retrogressive distance. He explained that the factor of safety of 1.4 was arrived at using very conservative assumptions and that in reality the factor of safety would be higher. As a result he felt no need to do a calculation of retrogressive distance. He does not know whether he would have done such a calculation if the FS had been 1.3. He avoided Leamen's hypothetical question assuming the slope to the east was steeper and the factor of safety was 1.3. He did concede that if the factor of safety had been 1.2 he would have done an analysis based on actual measurements. Leamen having gotten this response asked Walker why he did not start with a realistic calculation to begin with. Walker explained that they like to be conservative and used very conservative assumptions at the beginning to "see where we are".

Again, Walker confirmed that he had the Golder site specific report to Lamadeleine and knew that Golder was saying that it was safe to build to the south of the gully. He knew that Golder had done a lot of investigation along the river but explained that he had an opinion different from Golder based on the information that he had, limited to the plaintiff's property.

Even in the face of the Golder site specific report, Walker felt comfortable with his recommendations and before making his recommendations he did not speak to anyone at Golder's or at the Conservation Authority.

924 He confirmed to Leamen that he was comfortable with his report notwithstanding that he had never been to the site at the time he delivered the report, it was a technician who had taken the measurements limited to the plaintiff's property and no analysis of retrogressive distance was ever done.

Leamen produced to Walker a Paterson report dated October 11, 1991 relating to part of lot 17, Township of Cambridge. It was marked as Exhibit 45 in these proceedings. Walker acknowledged having read the report but was not involved in its preparation. The report is addressed to the National Bank of Canada. The author of the report is Andrew Tovell who is a senior geo-technical engineer with the Paterson firm. Walker became aware of the report last month while reviewing matters with Rasmussen. He has not discussed the report with Tovell. He acknowledged that the property which is the subject of this report has the same description as the plaintiff's property. He acknowledge that the property which is the subject of this report is east of the plaintiff's property and that he has not examined the area but conceded that the area under consideration would be close to the area 170 meters from our building.

The report, Exhibit 45, notes that the "crest of the slope at the closest steep part of the ravine is located 120 meters to the north of the rear wall of the house". A question arose at this point of the cross-examination as to the location of the house referred to and that point was eventually clarified by way of admission.

The report goes on to say that a direct line to the river intersects the crest of the ravine slope at a distance of approximately 150 meters from the rear wall of the house and notes that the field work consisted of determining the geometry of the slope at a critical section along the ravine and along the South Nation River slope to the north of the property. The report notes that "an engineer from this firm also visited the site to assess the existing slope conditions". Leamen asked Walker why it was necessary to send an engineer out in this case and not in the plaintiff's case and Walker really had no answer to the question.

The report notes that the existing soil conditions on the property are known from "our previous works in the area to consist of a veneer of fine sand over a thick deposit of sensitive silty clay". Walker conceded that this probably describes the same soil conditions as the plaintiff's property. At page 2 of the report the Poschmann study of the South Nation River is referred to and the author Tovell says, referring to the study:

> ... It does serve as a valuable assessment of risks associated with development along the South Nation River. In that report, the particular section of the South Nation River bank slope adjacent to the subject site is identified as having a factor of safety of the order of 1.2 to 1.5 which would indicate that the slopes have marginal stability.

Walker noted that he referred to that report in his work and that he came up with similar factors of safety.

Walker conceded that coming up with factors of safety of 1.2 to 1.5, Poschmann used the highest porewater pressure, that is, .62 as did Walker in his report. It should be noted that the Poschmann report was the result of a regional study by the Ministry of Natural Resources. Leamen suggested to Walker that the Ministry accepts a minimum factor of safety of 1.5 and Walker disagreed with that suggestion.

At Tab 1 is an MNR report entitled Calculation of Set Back Lines for Slopes with a Factor of Safety of less than 1.5, which Walker has seen. At page 13 of the report the following is said:

> Factor of safety is a ratio of the forces working to keep a slope intact (resisting forces) to the forces working to destroy it (driving forces). Theoretically a factor of safety of 1.0 implies that the resisting forces are just equal to the driving forces. In practice it has been found that a factor of safety of 1.5 is the critical value; that is, a slope with a factor of safety less than 1.5 will probably fail, while a slope with a factor of safety of greater than 1.5 will possibly fail. However any slope can fail, providing the correct conditions exist in the soil.

Leamen asked Walker whether he acknowledged that as a reasonable proposition. Walker said that if one was going to use terms probably and possibly then there would be merit in what is said at page 13 of the report.

Leamen pointed out that the Ministry determined 1.5 as a critical value using an assumption of high porewater pressure to which Walker responded that these were old set back lines which were used to initially prohibit building within the lines but now building is allowed.

Returning again to Exhibit 45, the Tovell report, and the assumed parameters for the detailed analysis of the stability of the slopes under consideration, Walker conceded that he used exactly the same parameters and indeed the same program to determine slope stability.

At page 2 of the report after indicating the parameters used, the author notes that "The slope along the south bank of the South Nation River has a minimum factor of safety (FS) of the order of 1.06". Leamen suggested that that was McRostie's most critical slope that was being discussed. Walker in response directed Leamen to the next paragraph which notes that "These factor of safety values are based on the slopes becoming fully saturated and using excessively high porewater pressure conditions (i.e. horizontal ground water flow) that are likely never to develop in the slope. The application of more realistic ground water flow criteria (i.e. flow parallel to the slope face) would result in considerably higher factors of safety".

Leamen pointed out to Walker that both he and Tovell did the same analysis using the same parameters and Paterson ended up with factor of safety of 1.4 and Tovell with a factor of safety of 1.06. Walker attempted to explain this away by saying Tovell may have been further east.

At page 3 of Exhibit 45 the following is said:

> In the case of slopes along the South Nation River it has been previously observed and is part of the engineering literature that initial failures along the riverbank often are followed by subsequent failures as the failed material from the initial slide is carried away by the river and does not provide adequate support to the oversteepend scarp slope resulting from the initial slide. Further slides can follow the second failure in the same manner. In this way the failures can retrogress further into the table lands than would be the case if the failure was limited to the initial slide mass.

Walker explained that this was a general comment applicable to the river in general although he was aware of retrogressive slides across the river from the plaintiff's property. He was also aware of the slide just down stream of the plaintiff's property on the same side as the plaintiff's property but did not know how far it retrogressed. Walker then made an interesting admission and that was that he had become aware of the slide downstream of the Lamadeleine property on the same side of the river as the Lamadeleine property since doing the work on the Lamadeleine property. In other words, he does not recall being aware of this slide at the time he prepared his report. He then testified that at the time of the report they had Ministry mapping and he believes that it showed the slides north of the river but doesn't know whether it showed the slide south of the river. He conceded to Leamen that the slide down river and on the same side of the river as the Lamadeleine property would have been of interest to him but would probably not have resulted in any different conclusions.

Walker acknowledged that they did know that with respect to the slides across the river the initial failure had retrogressed a significant distance back but pointed out to Leamen that there had been failures on the plaintiff's property that did not retrogress. As well he pointed out that he did not know when the slides across the river had occurred and conceded that that information would be relevant.

At page 4 of Exhibit 45 it is noted that the overall slope factor of safety at the riverbank is 1.06 and Walker conceded to Leamen that if he had gotten that result he would likely have done a retrogressive distance analysis.

Also at page 4 of the report, Exhibit 45, it is noted that in the face of a factor of safety of 1.06, the slope is isolated from the subject property by a ravine. Walker was asked whether there was any ravine on the plaintiff's property that offered protection to the sucrerie in the location in which it was built. Walker responded in the negative.

Leamen pointed out to Walker that he came up with a factor of safety of 1.4 with no ravine. He still said the building was safe. Tovell, on the other hand, had a factor of safety of 1.06 and a ravine. Tovell's report was done with respect to the safety of a single family residence.

[It should be noted that in general terms, Tovell's report is much more substantial than Walker's report notwithstanding that Walker's report was prepared in connection with the safety of a theatre restaurant that would house hundreds of people.]

Looking again at the Paterson report, Tab 79, Walker confirmed that they last page of the report which is titled Bore Hole Location Plan, was prepared by Mary Granville, Paterson's draft person. It would have been prepared on Walker's instructions. Leamen suggested that the drawing was not accurate. Walker responded that it had been prepared based on the copy of the drawing provided to them, that is the Golder drawing with the bore hole location whited out or removed. Walker did not know who had prepared the Golder drawing but assumed that it was correct. Walker noted, the drawing coming from Golder, he would not reinvent the wheel.

Walker was asked whether he could have, on his bore hole information, determined the estimated retrogressive distance. He responded that this would not be the best information to use because the soil samples had been somewhat disturbed in being taken back to the lab. Leamen asked him whether he could have applied the Mitchell formula to the information that he had from his own bore hole. As I understood his answer he could have done so if he thought it relevant to do so but he did not think it relevant in the circumstances. What they did do was determine the factor of safety and then do the failure circle.

Walker could not say whether Tovell had done a retrogressive distance measurement in connection with Exhibit 45 but Walker pointed out that Tovell was faced with a situation where there was a ravine acting as an interceptor to any retrogressive slide.

Leamen concluded his cross-examination by requesting Walker to get Tovell to tell him where the house was located and which slope he was evaluating.

Re-Examination by Rasmussen

Referencing the McRostie report at Tab 142, plate 1, Walker marked with red circles the two cottages on either side of the plaintiff's property between which he walked.

Still referencing plate 1 in Tab 142, there are two slope indicated there; 2A1-1 and 2A1. Rasmussen pointed out that the most critical slope as identified by McRostie is located between those two slopes. Rasmussen asked Walker whether he agreed with McRostie's identification. There was a long pause. He then responded that it is really tough to say, to pick the most critical slope until one does the calculations. It's the calculations which tell you which is the most critical slope. He chose slope 1 because of its height and steepness.

Walker did not send any reports to anyone other than Lamadeleine in 1990.

Charles Kwok

Examination-in-Chief

Mr. Kwok is 41 years of age and associated with the defendant Jacques Whitford Limited. He obtained his Bachelor of Civil Engineering in 1982 and his Masters in Geo-Technical Engineering in 1984. He has been with Jacques Whitford since 1988 in Halifax, Ottawa and Calgary where he is presently positioned. It was his colleague Raymond Hache who took the initial call from Lamadeleine the result of which Kwok attended at the site with Lamadeleine. He and Lamadeleine either drove or walked the forest road that boundaries the west of the property to the crest of the slope which was about 20 meters from the river's edge. They then went to the building site where the previous building had burned down and Lamadeleine asked him to do a geo-technical investigation with respect to that location.

Sometime before the attendance at the site Lamadeleine had provided Kwok with a site plan. The plan at the second last page of the Jacques Whitford report at Tab 72 is not exactly what Lamadeleine gave him but that page is based on what they received. It was Kwok's evidence that what he received from Lamadeleine had measurements noted on it.

After agreeing on a price a drill rig was set up and a bore hole was drilled. One of Jacques Whitford's hydro-geologists supervised the drilling. At Tab 1 of Exhibit 25, pages 1 and 2 are the hydro-geologists' rough field notes.

Kwok confirmed that the Jacques Whitford report at Tab 72 was prepared by him and in its preparation Kwok relied on the data in Tab 1 of Exhibit 25.

Page 3 of Tab 72, the Jacques Whitford report, describes the scope of the work as Kwok understood it and that was to investigate the soil conditions at the proposed building site by carrying out a field and laboratory study, to survey the gully immediately adjacent the proposed site in order to determine its slope stability and to provide geo-technical recommendations for the design and construction of the proposed structure. It was Kwok's evidence that the scope of work did not include an assessment of the slope stability at the banks of the river.

The report is dated October 31, 1990. At some point prior to the delivery of the report, Kwok had a telephone discussion with Lamadeleine. He told Lamadeleine that the report was pretty close to being ready. At that point Lamadeleine told him that he had to address the stability conditions of the South Nation River because this was very important to him. Kwok, at that point, appreciated that this was not part of the original mandate. He had looked at the riverbank at that one location on the forest road but he was not looking at retrogressive failure as part of his mandate at the time.

The last two sentences of the second paragraph in section 6.1 of his report at Tab 72 say the following:

> The stability condition of the Nation River located approximately 350 meters north of the proposed restaurant is not of concern. It is not expected that instability of the riverbank will jeopardize the proposed building at the location investigated.

Kwok, in his evidence, explained that the measurement of 350 meters was based on the distance of 1156 feet indicated on the drawing that he had received from Lamadeleine. As well, Kwok's evidence was that in including these two sentences in his report, he was intentionally addressing Lamadeleine's concerns as expressed to him over the telephone prior to the report being delivered.

At the last page of the report at Tab 72 is a profile of the gully. At the time that Kwok was doing his work he had no material from Golder nor had Lamadeleine told him before delivery of the report that he had a site specific report from Golder. As well Kwok, while doing his work, did not know that Paterson had been contacted nor, strangely enough, did Kwok know that Golder had been doing studies on the river for years.

With respect to paragraph 6.1, Kwok had gotten the 350 meters from the drawing and thought that this would put the building far enough away from the river and that there would be no problem.

At Tab 73 is the letter of transmittal dated November 1, 1990 which accompanied the Jacques Whitford report as it was delivered to Lamadeleine. After delivery Lamadeleine came in with the letter of transmittal and with another page attached thereto. Lamadeleine explained to Kwok that the suggested paragraph to be included in his report was authored by Lagarec (whom Kwok did not know) and that Lagarec was doing a study for the municipality, had seen the subject property, and in his opinion, it was safe to build north of the ravine. All of the handwriting on the two pages at Tab 73 are Lamadeleines. Lamadeleine, when he brought in the pages, asked Kwok to include in his report the typewritten paragraph prepared by Lagarec. At that point in time Kwok was not aware of the Golder report referred to in the suggested paragraph and so he asked Lamadeleine for it. In response, Lamadeleine provided him with Tab 15, the Golder report dated September 1988 to the Authority.

In his discussions with Lamadeleine, Kwok told him that he had not looked at the river from the point of view of retrogression. Lamadeleine indicated that he would have to put in the Lagarec paragraph because he had already advised with respect to the slope stability at the river and it would look silly if he didn't include it in his report. Kwok in response told Lamadeleine that they were not going to change their report. At the same time they were concerned about retrogression and he told Lamadeleine that he would look at the Golder report and write an addendum. Kwok explained in his evidence that at that point in time he was concerned about retrogression because he had said what he had in section 6.1 of his report (last two sentences) and now found that there were studies around with respect to retrogressive landslides on the river and he would have to address that point.

At Tab 2 of Exhibit 25 is a note that Kwok made during the course of a telephone discussion on November 5, 1990 with Grant Decow from the Conservation Authority. Kwok believes that at that point in time Decow had a copy of his report dated October 31 although Kwok had never sent it to anybody other than Lamadeleine. The notes discloses the following. Decow told Kwok that there was retrogressive failure up to 750 meters observed in historical terms (in 1895). The most recent failure was in 1971

which took 38 hectares. Decow asked him if he had looked at historical data and Kwok replied in the negative. Decow disclosed to him that there was a Golder report site specific for the same property. Kwok told him that he was not aware of that report and told Decow that he had not looked at the retrogressive failure aspect of the South Nation River. Decow told him that he would have to make his recommendations based on two separate reports (Golder and Jacques Whitford) and that he would make it on the more conservative side (Golder). Decow advised Kwok that Golder had indicated that the gully would act as a stop for retrogressive failure.

Kwok and his associate Hache had both Golder reports within a week or so and read them.

At Tab 66 is a letter received from Lamadeleine probably before Hache and Kwok went to the site again. In the letter Lamadeleine refers to Kwok wanting a report that Lamadeleine didn't even know existed. Kwok explained in his evidence that this was Golder's general report.

In the letter Lamadeleine says "I want you to tell me in a letter that you still believe that the set back which is about 350 meters is still adequate and should not jeopardize (in your opinion) the construction of my theatre restaurant which is one storey high." The letter also advises Kwok that Lamadeleine has already had two letters like that from Dr. Lagarec and the firm of John D. Paterson and Associates and Lamadeleine poses the question "If their opinion is the same, why would it be that you be different?" Kwok did get a copy of Lagarec's report which is at Exhibit 25, Tab 3 and dated November 15, 1990 but Kwok did not receive the Paterson report prior to his letter of November 22, 1990. He had no discussions with Paterson before submitting his report and letter of November 22 nor did he have any discussions with Golder prior to that time. It should be noted that the letter from Lagarec dated November 15, 1990 expresses "a limited potential retrogression" with respect to Lamadeleine's property.

Kwok, in his evidence, went on to explain that he wanted to address the slope stability part of his report because he was not prepared to leave it the way it was in that it was "wide open" and he hadn't looked at it from the point of view of a retrogressive landslide and therefore felt his report should be qualified.

About a week before November 22 both he and his associate Hache went to the site. They accessed the property from the forest road on the west side of the property and walked from there east along the bank looking at the terrace and the slope angle and the tree cover. The leaves were off the trees. He believes that they walked not very far past the east property line of the subject property. On the top of the slope they observed large tree trunks. Visibility at the shoreline was quite good and they could see 200 to 300 meters along the bank in an easterly direction (Kwok did admit that this was a total guess).

At Tab 76 is the letter sent out by Kwok to Mr. Lamadeleine bearing date November 20, 1990. Lamadeleine brought the letter back to Kwok with revisions as marked on the copy at Tab 6 of Exhibit 25. What Lamadeleine had done was to purport to completely erase the third paragraph on page 2 of the letter of November 20 wherein Kwok references the conditions immediately east of the site as being rather different and advising that the possibility of a retrogressive failure at that site has not been investigated and that failure upstream could possibly jeopardize a portion of the present site. As well, Lamadeleine had struck out the last paragraph of the letter of November 20 which indicated that as a condition of constructing the restaurant at the proposed location Kwok recommended an annual inspection be carried out to assess the stability conditions of the lower slope. As well, Lamadeleine purported to add a paragraph to the effect that "It is the opinion of this firm that the set back in this case is more than adequate".

At Tab 80 is the letter of November 22 from Kwok which represents the last communication with Lamadeleine. The letter of November 22 changed the letter of November 20 in the following fashion. The letter of November 20 provided as a concluding paragraph the following:

> As a condition of constructing the restaurant at the proposed location, we recommend an annual inspection be carried out to assess the stability conditions of the lower slope. Such inspections should be conducted in the spring and should consist of detailed photographic record of conditions such as erosion and other signs of distress. Should the inspections reveal adverse conditions remedial measures may be required. Removal of vegetation should not be carried out anywhere within the property.

In the November 22 letter the last paragraph read as follows:

> Should the conditions of the riverbank (such as erosion etc.) change in the future, the overall stability of the site should be assessed at the time. Remedial measures may be required according. Presently, removal of vegetation should not be

carried out anywhere within the property.

[So it is apparent that Kwok cooperated with Lamadeleine to a certain extent by removing from the letter of November 20 the condition that there be an annual inspection carried out to assess the stability conditions of the lower slope.]

Kwok in his evidence explained that by his letter dated November 22, he was trying to convey the fact that he could not completely rule out the possibility of a future retrogressive landslide similar to those which occurred in 1971 and 1910. He was also conveying that having regard to the terrace, if there was a failure at the toe of the slope the chances were that it would be confined to the area below the terrace. Kwok explained in his evidence that he retained his reservation with respect to the riverbank conditions immediately east of the site because he had not investigated that location. In his letter of November 22 he declined to strike out the third paragraph on page 2 referencing the conditions to the east of the site because he felt it was an important part of the report to convey that the riverbank failure is not restricted to the property owner. Kwok in his evidence explained that in expressing the caveat in the last paragraph of his letter to the effect "provided that the existing site conditions are unaltered", he was referring to both human activity such as steepening the bank or taking down trees and to natural erosion.

The letter of November 22, 1990 was sent by Kwok to Lamadeleine by fax. He does not recall if he heard back from Lamadeleine with respect to the letter however on December 20, 1990 he got a call from Denis O'Grady of the Conservation Authority requesting a copy of the November 22 letter. He called Lamadeleine for permission to do so and Lamadeleine declined to consent but asked Kwok to fax him a copy of the letter instead. See the memo to file made by Kwok, Exhibit 46, and see the fax from Kwok to Lamadeleine dated December 20, 1990 attaching the letter of November 22. Lamadeleine did not explain why he wanted another copy nor did he offer any explanation why it should not be sent to O'Grady.

Kwok reattended at the site in November/December 1996 in connection with the OMB matter. He took the same route as in 1990, down the forest road and up and down the riverbank. He talked to Morey before he went out. Morey indicated that there was a minor failure in 1995 on the plaintiff's property which took 10 feet at the top of the slope at the west property line where there was no terrace. Morey informed him that the slough had taken out one of the piezometers. On his re-attendance in 1996 Kwok noticed the slough at the west boundary of the property and also noticed smaller erosions along the bank of the property. This did not cause him to change any of the opinions expressed in his report and in his letter of November 22 which had specifically warned that should the conditions of the riverbank (such as erosion) change in the future, the overall stability of the site should be assessed at that time.

Cross-Examination by Leamen

Kwok knew that his retainer was with respect to the construction of the building on the burn out site north of the gully and knew that the purpose of the report was to obtain a building permit.

Leamen put an interesting question to Kwok on cross and that was what was he trying to say in his letter of November 22, 1990. Yes build or no don't build. In response to that question Kwok waffled to some extent and started reading his opinion. Leamen pressed the matter. Finally Kwok said that his letter of November 22 was saying that it was safe to build with a strong reservation. Still Leamen pressed and said "Should Lamadeleine build or not build?" to which Kwok replied it was "Up to him".

Leamen still pressed and asked Kwok what he would do if he was the owner of the property and Kwok conceded that "It would be a gamble". He confirmed that having been back to the property in 1996 he would still consider it a gamble today.

Lamadeleine had not told Kwok not to look at the slopes to the east of the property but Kwok did not do that because he was not asked to do it.

Kwok conceded that before he completed his main report dated October 31, 1990 Lamadeleine had asked him to address the slope stability at the river. He conceded that he addressed that slope stability in section 6.1 of his report without doing any tests. He explained that he did so "Because retrogression was not the topic". He conceded that if it had been the topic then he would have done a slope stability analysis as he did with the gully.

Leamen suggested to him that without appropriate tests he was not in a position to express an opinion on the slope stability at the river to which Kwok responded that that would depend on the conditions and sometimes just a look would be sufficient. In this case, he thought that any failure would extend no more than 40 meters from the river's edge and the building being 200 meters from the river's edge, there was no problem.

Leamen pointed out to Kwok that in section 6.1 of his report he notes that the Nation River is located approximately 350 meters north of the proposed restaurant. Kwok conceded that that was the distance indicated in the site plan and it was not the closest distance to the river. He maintained that it really didn't matter because retrogression was not in his scope of work. [This doesn't make a whole lot of sense]

Leamen asked him why he mentioned the 350 meter distance and Kwok responded that one always has to say where the proposed building is. Leamen suggested that the distance is irrevelant to any consideration of retrogressive failure and Kwok responded that it was irrelevant because retrogressive failure was not a part of his study.

Kwok conceded that by November 22 he knew the distance was less than 200 meters but that reduced distance did not contribute to his strong reservation.

Kwok confirmed that it was his associate Hache who attended at the OMB meeting in 1996/97 in anticipation of his testifying before the Board. Leamen asked if Hache was prepared to say to the Board that it was a "gamble" as Kwok had put it and he was unable to say although he felt that Hache held the same view as he but he might not have used the same word. Again he explained that what they were saying was it's fine with a strong reservation, maybe yes, maybe no. [In my view his report and his letter fails to convey what he says he was attempting to convey and that is that it was a gamble to build north of the ravine].

Kwok conceded that prior to November 22 he had Golder's phase I report and Golder's site specific report and both expressed a reason to be concerned. He had also spoken to Decow with respect to the 750 meter retrogressive slides and this was reason to be concerned. Kwok did not speak to Morey notwithstanding that he had his two reports. It was his evidence that he did not speak to Paterson because he did not think their report was finished notwithstanding the letter at Tab 66 from Lamadeleine indicating that he had two letters, one from Lagarec and one from Paterson. It was Kwok's evidence that what Paterson might think was not important to him. What was important is what he thought.

He does not recall whether he saw the air photos in the Golder site specific report. Leamen referred him to the air photos in Golder's report at Tab 23, page 157 and to Exhibit 2 which is a clearer picture of the area indicating the three retrogressive landslides in the area of the plaintiff's lands. Kwok did not recall whether he had seen them but finally said he would have looked at it. Looking at the air photo now, he was able to see the retrogressive slides across the river from the plaintiff's property. He agreed that they were significant with respect to the plaintiff's property. In the face of that concession, Leamen asked him what consideration he gave to those previous landslides. Kwok responded that what was important was whether or not there would be an initial failure. He looked at the plaintiff's land and saw much vegetation. He looked across and saw no vegetation. He reiterated his opinion that it is unlikely that there would be an initial failure and if there was, it would be limited to the terrace.

Kwok conceded that there had been an initial failure after his report but explained that it was really a sloughing and was not a big rotational failure.

Leamen and Kwok then got into the same discussion as before about the fact that the November 22 letter intended to address the slope stability at the river but that Kwok did no testing in that respect. The situation got curiouser and curiouser with Kwok now saying that the testing had been done prior to the first report and that in his opinion it was border line with respect to retrogression. He conceded that he did no additional testing for the second opinion because the data was already there indicating that the slope was border line for retrogressive failure. He conceded that he gave his first report and the opinion therein without considering retrogression and then after that had to look at retrogressive failure at that location. To do that he visited the site and made quick calculations which he is unable now to locate. He did not do a factor of safety calculation. He then surprised everybody by saying that he did do a retrogressive distance calculation using the Mitchell formula with the result that he calculated the retrogressive distance to be about 100 meters from the shoreline. For this calculation he used the information from his bore hole near the building. He does not have those calculations either.

[Note if anything turns on it, I completely reject Kwok's evidence with respect to his having done any quick calculations after returning to the site and with respect to his having done any calculation as to the retrogressive distance using the Mitchell formula or any formula at all.]

Finally, Leamen directed Kwok once more to page 2 of his report, paragraph 3 which suggests that while a failure upstream could possibly jeopardize a portion of the present site, it is also noted that a ravine is present between the proposed restaurant and the east property line and that a ravine such as the existing one may act as a potential barrier of retrogressive failure. With respect to that suggestion, Kwok conceded that the ravine is

not within the plaintiff's property and if the retrogression was west of the ravine, it would be of no help.

With respect to the location of the house which was the subject matter of Exhibit 45, the Paterson report of October 11, 1991, Rasmussen admitted its location by reference to Exhibit 10 with a circled X. The house is located in the very south east corner of the Lamadeleine property.

That having been admitted it appears that part of the deal for the admission was that Rasmussen would have an opportunity to call Tovell which he did.

Andy Tovell

Examination-in-Chief

Tovell obtained his Bachelor of Applied Science and Civil Engineering in 1979 and by 1982 had successfully completed seven post graduate geo-technical engineering courses at Carleton University. He is a member of the Canadian Geo-Technical Society and has been employed by Paterson from 1979 to present.

Tovell explained that Exhibit 45 was prepared for the National Bank and was not given to anybody else.

Tovell explained in his evidence that he analyzed both the ravine slope and the slope along the south bank of the river. The ravine slope had a FS of 1.15. The slope along the river had a FS of 1.06. In both calculations he used a pore pressure of 0.62. In each analysis he used a pore pressure of 0.62 which represented full hydrostatic saturation with horizontal flow. Exhibit 49 are field notes which Tovell made at the time relating to slope measurements. Tovell explained that he walked the slope with an inclinometer and measuring tape. He identified the slope as being that shown as 2A1 on Exhibit 10. His Exhibit 49 notes indicate slow river velocity at that point and minor slips which have occurred without retrogression.

Arriving at a FS of 1.06 for the slope along the south bank of the river Tovell used the parameters or assumptions indicated immediately above that statement which included a pore pressure ratio of 0.62. The second last paragraph on page 2 of Exhibit 45 states the following:

> These factor of safety values are based on the slopes becoming fully saturated and using excessively high porewater pressure conditions (horizontal ground water flow) that are likely never to develop in the slope. The application of more realistic ground water flow criteria (i.e. flow parallel to the slope face) would result in considerably higher factors of safety.

Tovell explained that by way of example if you have under drainage then this results in a greater reduction of porewater pressure and the safety factor goes up appreciably. It was Tovell's evidence that there was under drainage at this site as evidenced by the Golder report and the results of bore hole nearby.

Tovell then, over Leamen's objections, expressed the view that taking actual circumstances into consideration using actual porewater pressure as opposed to assumed the factor of safety came to 1.87 as indicated in Exhibit 50 and is a computer print out of the calculation. He explained that the information upon which he based his calculations comes from Tab 15, the Golder report of September 1988 to the Authority, using the bore hole information from bore hole 21 but also looking at bore holes 1 and 2 to see if bore hole 21 was representative. In his view, the bore hole information shows significant under drainage below the clay. Bore hole 21 was closest to the slope and close to the edge of the ravine. It was his opinion that the under drainage ran along the entire face of the subject property and that it would give a factor of safety higher than if the information had not been considered.

Cross-Examination by Leamen

The report, Exhibit 45, was prepared for the bank with respect to a house that was already constructed and was generally directed toward the risks of living there. Tovell acknowledged that there are significant risks to living on the river and he had done previous work on this stretch of the river. He speculates that there was probably a pending sale of the property and conceded that an unsafe report from him would not be favourable for a sale.

In attending at the site after receiving the information from the technician he did so because he needed additional information that he could only obtain by attendance at the site. In viewing the site he crossed other people's lands. There was no firm Paterson policy not to trespass. He did not walk the shore to find the most critical slope because the house under consideration was engulfed with two ravines. Had it not been he probably

would have walked the shore to find the most critical slope. He would have gone 100 meters in both directions starting with the closest point on the river to the building. There would be no point in going to a point at an angle perhaps twice the distance to the closest point. The further you get from a perpendicular location, the less the significance.

Tovell agreed that the factor of safety is a theoretical calculation to determine an acceptable level of risk and he conceded that the accepted practice is to use 1.5 as a minimum.

The witness agreed that if one could get precise measurements of the components that go into the FS calculation, that particular FS would be relevant only to the conditions as they exist at that time. The witness agreed that for that reason you usually don't use actual measurements because there is not a long enough record of them but he felt that the Golder information did produce records of sufficient length of time. He agreed that sometimes the worst conditions occur but still those conditions must be tempered with site conditions. He explained that because in these calculations we are dealing with theoretical maximums then we don't rely on 1 or 1.1. Other factors may come into play and so the geo-tech engineers say that they had better use 1.5.

The witness had no quarrel with the MNR saying that the theoretical acceptable factor of safety is 1.5.

Leamen directed the witness to Tab 1, page 13, the MNR report on the calculation of set back lines which says that in practice it has been found that a factor of safety of 1.5 is the critical value, that is a slope with a factor of safety less than 1.5 will probably fail while a slope with a factor of safety of greater than 1.5 will possibly fail. The witness was unable to agree with that portion of the report explaining that he had not seen enough information to say that slopes which approach 1.5 will fail. He did agree that 1.5 is accepted as a theoretical measure.

The witness agreed that his calculated factor of safety at 1.06 was not sufficient in that it didn't satisfy the 1.5 rule but he quickly added that the factors actually on site were not the factors that he used in making the calculation.

The witness confirmed that the alleged under drainage information was actually in existence in 1991 but he was not aware of it. This information on which he concluded the existence of under drainage did not come to him until the day before he testified. He explained that in 1991 it was not that important to determine the conditions at the river because the building was protected by ravines so at the time he did the study in accordance with usual standards.

The witness conceded that what under drainage does is discourage initial failure. It has nothing to do with retrogression in the sense that retrogression can still occur with under drainage but if there is no initial failure, there is no retrogression.

Leamen pointed out that in his report the witness said that there was some initial failures and that meant that the under drainage was not sufficient to stop the initial failure. The witness explained that the failure was as a result of the river eroding, not a circular failure. It was, as he described it, a "minor slippage" as a result of the river flow.

Leamen discussed with the witness the two landslides across the river and the one slightly downstream on the same side as the Lamadeleine property. He put it to the witness that whatever under drainage there was there, it had no effect. The witness replied that he did not know if there was under drainage there.

Tovell conceded that even if there is under drainage there can still be an initial slope failure and retrogression.

He admitted that he had not examined the aerial photos before preparing his report of October 11, 1991 saying it was not a relevant piece of information but on being pressed by Leamen he agreed that there were landslides beside the subject property where a building was to be constructed that would not be protected by gullies, then one could not disregard the existing landslides.

Finally he conceded that a reasonably competent engineer looking across the river and seeing the scars of the retrogressive slides would in those circumstances consider the possibility of retrogression on the subject lands.

Re-Examination by Rasmussen

The witness explained that assuming a factor of safety of 1.5 is theoretically the critical factor then in determining that number and in determining the likelihood of failure, one must use the most conservative factors.

Looking at Exhibit 51 and the piezometer readings from bore holes 21 and 1 and 2, the witness noted that those readings were consistent over a relatively long period of time from February 1 to April 11 the period when one would normally have the worst conditions of the year.

The witness confirmed in re-examination that in his mind sloughing of a riverbank is not synonymous with an initial failure.

Again looking at Exhibit 51 the witness purported to say that he did not consider either of the two landslides across the river to be directly across the river at his site. [What I get from Leamen's cross-examination is that it doesn't really matter if you can take actual figures in the formula and get to a factor of safety of 1.5. The accepted manner of proceeding is to use the most conservative factors and then see what factor of safety you come up with. If its less than 1.5 then it doesn't meet the standard, at least the standard required by MNR.

That finished the evidence for the defendant consultants. Mr. Marcus then called Steve Gauthier to give evidence on behalf of the Township.

Steve Gauthier

Examination-in-Chief

Mr. Gauthier is employed by the Nation Municipality. Cambridge is one of the Townships of the four that were amalgamated in January 1998 to form Nation Municipality. He has done some research and looked at documents and spoken to some people in order to give some evidence at this trial.

He was able to find out that the Township had a planner from 1984 to 1988 but none between 1988 and 1995.

Cambridge was a rural and agricultural community with small hamlets during the period in question.

The letter at Tab 64 from the Conservation Authority to the Clerk of the Township, Roger Brunet, dated September 20, 1990 was received by the clerk on September 26, 1990. The letter references the clerk's concern with respect to redevelopment at the site of the summer theatre. The letter notes that upon reviewing the Golder site specific report which was mandated to assess the slope stability of Lamadeleine's property, it clearly identified an area where construction on the lot might be feasible. The letter points out that the enclosed map taken from the report indicates where on-site existing ravines act as a natural barrier to potential landslides and the report very clearly identifies the area on the site which is considered safe from landslide retrogression as an area bounded on the north by the east west running ravine located immediately south of the existing building and on the west by a line drawn southward from the south east corner of the dance hall building to the north west corner of the existing house. (In other words it's safe to build on the south side of the ravine). Gauthier was able to confirm that that was the understanding at the time.

At Tab 67 is Lamadeleine's letter to the Authority dated October 1st wherein in the last paragraph thereof Lamadeleine then vows to fight to rebuild on the same site because that's where it was before.

At Tab 70 is the building permit issued October 16, 1990 showing an estimated cost of construction of $122,000.

At Tab 65 is the application for the building permit where under the heading "Description of the Work" the phrase "construction of the sucrerie theatre to the south of the ravine" was amended to read "construction of the sucrerie theatre to the north of the ravine" and the amendment is initialled by the building inspector, Andre Brisson and dated December 7, 1990.

The witness Gauthier addressed the question what happened between October 16 and December 7. He indicated that different studies were prepared during that period of time by Jacques Whitford, Paterson and Lagarec showing minimal risk to building to the north of the ravine. Tab 83 is a letter from the municipality to Lamadeleine dated December 5, 1990 advising him that a resolution of counsel had been past on December 3, 1990 to the effect that having regard to the Whitford, Paterson and Lagarec reports, it is confirmed that reconstruction of the restaurant on the north side of the ravine seems to be secure and permission is granted to so construct. Then the application (Tab 65) was changed from south to north on December 7.

Finally the witness confirmed that the letter of Whitford to Lamadeleine dated November 22, 1990, Tab 80, was received by the municipality on November 29, 1990.

Cross-Examination by Leamen

This witness had no involvement with the Nation Municipality or the Township of Cambridge prior to 1998. The witness confirmed that Mr. Brunet who was the town clerk at the material time would know all about this as would Mr. Brisson who was the building inspector at the time as would members of the counsel at the time. The witness confirmed that they're still around in the area and are available to come. Indeed the witness confirmed that he has tried to contact Mr. Brisson by way of telephone and letters. He is there but he will not respond in any way and the witness does not know why.

Country Pork Ltd. v. Ashfield (Township)

Between
Country Pork Ltd., applicant, and
The Corporation of the Township of Ashfield and Chief Building Official of the Corporation of the Township of Ashfield, respondent

[2001] O.J. No. 1127
Court File No. 30858

Ontario Superior Court of Justice
Leitch J.

Heard: October 23-24, 2000.
Judgment: February 28, 2001.

Counsel:

Thomas J. Corbett, for the applicant.
Daniel Murphy, for the respondents.

¶ 1 **LEITCH J.**:— The applicant seeks an order quashing Interim Control By-law No. 14, 2000 of the Corporation of the Township of Ashfield (the "Township") and an order directing Mr. John Maize, the Chief Building Official of the Township to issue a building permit to the applicant pursuant to s. 25 of the Building Code Act, 1992, S.O. 1992, c. 23.

¶ 2 Interim Control By-law No. 14, 2000 received first, second and third reading on June 26, 2000. The By-law is in effect for one year and prohibits the establishment of a livestock facility, building or operation, including liquid manure storage facilities with a capacity for 100 or more livestock units where such livestock operation involves, requires or is designed for a liquid manure system. It also prohibits the expansion of an existing facility, building or operation where the capacity after expansion is 100 or more livestock units.

¶ 3 On July 6, 2000 the Township Council considered the applicant's request to be exempted from the By-law, however, an exemption was not granted.

¶ 4 The applicant asserts that its application for a building permit crystallized before the Council passed the Interim Control By-law. Alternatively, the applicant asserts that the By-law is contrary to the official plan of the Township and therefore s. 24 of the Planning Act, R.S.O. 1990 c. P.13; the By-law is illegal because it was passed in bad faith and in unfair circumstances without notice to the applicant, a breach of natural justice and; the By-law is ultra vires the Township's powers because its provisions are contrary to the Farming and Food Production Protection Act 1998, R.S.O. 1998, c. 1 and the ministerial directive June 26, 2000 pursuant to that statute.

LEGISLATIVE PROVISION RELATING TO INTERIM CONTROL BY-LAWS

¶ 5 Section 38(1) of the Planning Act provides as follows:

> Where the council of a local municipality has, by by-law or resolution, directed that a review or study be undertaken in respect of land use planning policies in the municipality or in any defined area or areas thereof, the council of the municipality may pass a by-law (hereinafter referred to as an interim control by-law) to be in effect for a period of time specified in the by-law, which period shall not exceed one year from the date of the passing thereof, prohibiting the use of land, buildings or structures within the municipality or within the defined area or areas therefore, or except for, such purposes as are set out in the by-law.

¶ 6 With respect to the issue of notice, s. 38(3) provides as follows:

> No notice or hearing is required prior to the passing of a by-law under subsection (1) or (2) but the clerk of the municipality shall, in the manner and to the persons and public bodies and containing the information prescribed, give notice of a by-law passed under subsection (1) or (2) within thirty days of the passing thereof.

ISSUE NO. 1 - DID THE APPLICANT'S APPLICATION FOR A BUILDING PERMIT CRYSTALLIZE BEFORE THE PASSING OF THE INTERIM CONTROL BY-LAW?

¶ 7 The applicant acquired the property in question on June 15, 2000. The applicant retained a consultant, Mr. Matt Ueckermann, to act on its behalf in making application for a building permit. Mr. Ueckermann had acted in a similar capacity with respect to three prior applications for building permits made by the applicant to the Township.

¶ 8 Mr. Ueckermann met with Mr. John Maize on June 16, 2000 and delivered a Nutrient Management Plan prepared by Mr. Ueckermann and approved by OMAFRA on May 23, 2000 and drawings of the proposed barn and manure storage tank prepared by Mr. Nelson Dawley, an independent engineer retained by the applicant. Mr. Ueckermann deposes in his affidavit sworn July 21, 2000 in support of this application that he requested Mr. Maize complete the building permit application and the building permit but Mr. Maize indicated he wished to check distances with the Township's planner, Mr. Scott Tousaw, and wanted to discuss the application further.

¶ 9 Mr. Ueckermann further deposes in para. 24 of his affidavit that:

> I was surprised by Mr. Maize's reluctance because this had not occurred when I had made the three prior applications. In fact, I had brought with me a blank signed cheque to pay for the building permit.

¶ 10 Mr. Ueckermann also deposes that Mr. Maize assured him that everything was in order with respect to the application and there would be no problem in issuing the building permit.

¶ 11 When Mr. Ueckermann followed up with Mr. Maize on Monday, June 19, 2000 he was advised that the project would be discussed at the meeting of Township Council scheduled for Tuesday, June 20, 2000. Mr. Maize attended that meeting and as he deposes in his affidavit, he met with Council to review the Nutrient Management Plan and was instructed to deliver the plan to the Township's solicitors. Mr. Ueckermann deposes that in their June 19th telephone conversation, Mr. Maize had indicated that he did not foresee any problems with the application and invited Mr. Ueckermann to contact him Wednesday, June 21, 2000. Mr. Ueckermann did so and in their conversation of June 21, 2000 Mr. Maize indicated that the permit would not be issued because the Nutrient Management Plan had not been signed and a certificate was required from Mr. Nelson Dawley stating that the storage tank was watertight. Mr. Maize had not imposed these requirements in any of the prior applications that Mr. Ueckermann had made.

Mr. Maize forwarded correspondence dated June 21, 2001 to Dawley Engineering setting out the requirements of the certificate. In their June 21st conversation Mr. Maize directed Mr. Ueckermann to Mr. Murphy who, the applicant asserts, is the solicitor for the Township but not the solicitor for Mr. Maize.

¶ 12 In a subsequent conversation between Mr. Ueckermann and Mr. Murphy, it was clarified that the Nutrient Management Plan had been signed. However, Mr. Murphy indicated the Township took issue with the Nutrient Management Plan in certain respects and in correspondence dated June 22, 2000 Mr. Murphy outlined requirements which had to be met before a building permit would be issued. These requirements were:

(1) that the applicant provide the certificate from Mr. Dawley;
(2) that a development agreement be entered into as required by the Township by-laws;
(3) that a signed application for a permit be submitted together with the necessary fee;
(4) the Nutrient Management Plan may have to be reviewed by an independent consultant.

The significant point for the applicant is that none of these requirements were required in the three prior applications. Additionally the applicant asserts that Mr. Dawley's certificate was faxed to the Township on June 26th before the Council met and the Nutrient Management Plan had been approved by OMAFRA, which is an independent body.

¶ 13 The Township's position is that this application is different from the prior applications in that the prior applications did not contain outside manure tanks. In the prior applications that Mr. Ueckermann has referred to, the manure was to be stored in tanks under the barn rather than in outside tanks.

¶ 14 The Township passed the interim control by-law on June 26, 2000.

¶ 15 When Mr. Ueckermann questioned Mr. Maize on June 27, 2000 on the status of the building permit application, Mr. Ueckerman was informed that the interim control by-law had been passed.

¶ 16 On June 28th the applicant signed the application for a building permit.

¶ 17 The Township takes the position that a building permit cannot be issued to the applicant because its application was not made until June 28th, two days after the By-law was passed.

¶ 18 The applicant's position is that the applicant had complied with all applicable law by June 19, 2000 and was entitled to its building permit on that date.

¶ 19 S. 8(2) of the Building Code Act specifies that a Chief Building Official "shall issue a permit" unless the proposed building will contravene the Building Code Act, the building code or any other applicable law; the application is incomplete or any fees are unpaid. The regulations to the Building Code Act provides the following definition of applicable law:

> ... any general or special Act and all regulations and by-laws enacted thereunder which prohibits the proposed use of the building unless the Act, regulations or by-law is complied with.

¶ 20 Pursuant to s. 25(4) of the Building Code Act this court stands in the shoes of Mr. Maize and may "take such action as ... the chief building official ought to take ... and, for such purpose, may substitute his or her opinion for that of ... the chief building official".

¶ 21 Mr. Maize, as the Chief Building Official for the Township had no discretion to refuse to issue the permit if all the statutory requirements had been fulfilled (see Alaimo v. York (City) Chief Building Official (1995), 26 M.P.L.R. (2d) 69 (Ont. Gen. Div.)). If no law is contravened then the permit must issue. The issue then is whether Mr. Maize was obliged to issue the building permit on June 19th as the applicant asserts. Was there compliance with applicable law on that date? Because the rights of an applicant to a building permit crystallize and are to be determined as at the date when the applicant has fulfilled all of the requirements necessary for the issuance of a building permit, the issue for this court can be put another way - had the applicant fulfilled all of the requirements necessary for the issuance of a building permit before the Interim Control By-law was passed on June 26th (see Woodglen & Co. Ltd. v. North York (City) Chief Building Official [1994] O.J. No. 2206 (Ont. Gen. Div.) citing Karavos v. Toronto (city) et al., [1947] O.J. No. 331, [1948] O.W.N. 17 (C.A.) and Wolfond et al. v. North York (City) Building Commissioner (1990), 1 MPLR (2d) 189 (Ont. Dist. Ct.)).

¶ 22 These questions can be answered by consideration of two arguments advanced by the applicant. The first requires an analysis of the evidence given by Mr. John Maize in his affidavit sworn August 29, 2000 and in the cross-examination on his affidavit September 19, 2000. The applicant's position is that the evidence of Mr. Maize on cross-examination amounts to an admission that the applicant had complied with all applicable law as of June 19, 2000. In making that assertion the applicant relies in large part on the following question and answer given by Mr. Maize after acknowledging that he had indicated to Mr. Ueckermann on June 19th that he did not foresee any problem with the application:

> Q. 229 - And having said that on June 19th to Mr. Ueckermann, you were satisfied at that point that the County Pork application had met all the requirements of law that you knew existed on that date?
> A. Yes.

¶ 23 In his affidavit Mr. Maize deposes that none of the Township's by-laws contained any design criteria for manure storage tanks. Mr. Bruce Potter, a civil engineer for the Township, in an affidavit sworn August 29, 2000 deposes that neither the Ontario Building Code nor the National Building Code provides any design criteria for the floors of the manure tank. Both Mr. Maize and Mr. Potter in their affidavits refer to incidents in the Township involving what they considered to be a failure of manure tank design which had led to discharge of manure into drains and ultimately into Lake Huron. Further, in para. 16 of his affidavit, Mr. Maize makes reference to the manure tank failures in the Township and deposes as follows:

> Previous to the above two manure tank failures, I, as Chief Building Official, relied on plans submitted by engineers from time-to-time in connection with building permits. Since that date I have not issued any building permits for manure tanks without obtaining the certificate from the engineer as outlined in my letter of June 21, 2000 to Dawley Engineering.

In 1999 Mr. Maize required, pursuant to the recommendation of Mr. Potter, a certificate from the engineer retained for that project (who coincidentally was Dawley Engineering) that, amongst other things, the structure was

water-tight on an application for a large barn with an outside manure storage tank (the "Nyland Application")).

¶ 24 Mr. Potter in his affidavit deposes that in connection with this application he "reviewed the engineering plans for a manure tank supplied by Dawley Engineering and instructed the Chief Building Official to write the letters dated June 21, 2000".

¶ 25 On June 21, 2000 Mr. Maize wrote to Dawley Engineering indicating that he would require a certificate confirming a number of things, including a certification that the structure was water-tight and that Dawley Engineering had been "retained to provide review of a construction and certification that this facility is constructed in accordance with the drawings".

¶ 26 Mr. Dawley, in his affidavit, deposes that the two letters that he forwarded to Mr. Maize on June 26, 2000 in response to Mr. Maize's letter of June 21, 2000 were similar to his correspondence relating to the Nyland application. His letter of June 26, 2000 indicates that the manure tank had been designed in accordance with the design for the Nyland tank and that on completion of the project a letter would be issued stating compliance with applicable codes. Both Mr. Potter and Mr. Maize, according to their affidavits, are of the opinion that Mr. Dawley's June 26th correspondence is inadequate in that it did not clearly state that Dawley Engineering had been retained to be responsible for the design of the entire facility, nor did the correspondence specifically give an opinion with respect to water-tightness of the structure. Therefore, in the mind of Mr. Maize, after having taken advice from Mr. Potter, the applicant had not fulfilled all the requirements necessary for the issuance of a Building Permit before the Interim Control By-law was passed. In my view, the applicant cannot rely on Mr. Maize's response to Q. 229 on his cross-examination as an admission that as of June 19th all requirements of applicable law had been met. That response is inconsistent with the actions taken by Mr. Maize after June 19th.

¶ 27 There are two remaining questions to consider - was Mr. Maize influenced by Council after June 19th and were the requirements imposed by Mr. Maize on June 21st on the applicant part of the applicable law?

¶ 28 The applicant's solicitor cross-examined Ms. Linda Andrew, the Township's clerk-treasurer on her affidavit sworn August 31, 2000 and examined in aid of this application Mr. Ben Van Diepenbeek, the Township Reeve; Mr. Art Simpson, the Deputy Reeve; and Marilyn Miltenburg, Connie Black and Michael McKeon, the three Township Councillors. Having reviewed all of the affidavits and the transcripts from the cross-examinations and examinations, I find no evidence that Council interfered with the authority of Mr. Maize to issue a building permit.

While Mr. Maize's letter of June 21st to Dawley Engineering was written after the Council meeting on June 20th, there is no evidence that Council interfered with Mr. Maize's review of the materials filed by the applicant. In fact according to Mr. Maize's evidence on cross-examination, he forwarded his June 21st letter to Dawley Engineering at the suggestion of Mr. Potter. On cross-examination Mr. Maize denied the suggestions that at the June 20th Council meeting he was questioned about a number of things associated with the application and at the meeting people had expressed concerns that they wanted him to address. He also disagreed with the suggestion that the Township had pretty much taken dealings with the applicant out of his hands.

¶ 29 Mr. Ueckermann essentially deposes in his affidavit that he expected to receive the building permit June 16th in accordance with his request and was surprised when he did not. I find it unrealistic to the point of being incredible, that Mr. Ueckermann had such an expectation given the quantity of material submitted with the application - the 150 page Nutrient Management Plan and the engineering drawings. Mr. Ueckermann would have been aware that there had been discharge from manure tanks in the Township and a very recent tragedy in Walkerton and it was not reasonable to expect Mr. Maize to issue the building permit on the spot.

¶ 30 It is important to examine what Mr. Maize did after he received the materials on June 16th. He consulted with Mr. Tousaw with respect to setbacks. He consulted with Mr. Potter with respect to the drawings. It is relevant to note that this was the first application for a building permit since the two manure storage tanks had failed and only the second application involving an outside manure storage tank. Additionally, the proposed barn was significantly larger than the barn in the Nyland application. The Nutrient Management Plan was a requirement of the Township's by-law. Mr. Maize indicated on his cross-examination that he did not understand Nutrient Management Plans at all. Mr. Maize sought the advice of Council with respect to whether the plan complied with the by-law and he was directed to the Township's solicitor in that respect. I am satisfied that there is no evidence that the Township interfered with the authority of Mr. Maize in connection with this application.

¶ 31 Mr. Dawley in his affidavit states his opinion that he cannot guarantee that a structure is water-tight and "such a request demands a

guarantee over circumstances to which I do not have any control." Subsection 7 of s. 2.2.1.13 of the National Building Code provides that manure storage tank walls shall be designed and constructed to prevent leakage of the contents. The subsection references Appendix which sets out what factors are to be taken into account in the design of manure tank walls and bottoms to prevent leakage of the contents. As Mr. Potter and Mr. Maize (relying on Mr. Potter's advice) depose there are no design criteria for manure tanks in the Township by-laws or in the National and Ontario Building Codes. As a result to fulfil the requirement of the National Building Code that the tanks must be designed and constructed to prevent leakage certification to that effect was sought from Dawley Engineering. I am of the view that it was within Mr. Maize's discretion to request the confirmations he did from Dawley Engineering and he was not influenced to do so because of improper interference by Council.

¶ 32 Accordingly, I am satisfied that the applicant was not entitled to a building permit prior to the passage of the Interim Control By-law.

ISSUE NO. 2 - DOES THE INTERIM CONTROL BY-LAW COMPLY WITH THE OFFICIAL PLAN OF THE TOWNSHIP?

¶ 33 The Township, as a result of requests from various citizens groups, had considered the passage of an interim control by-law in 1997. The Township Council on September 16, 1997 requested a report and opinion on the planning rationale of an interim control by-law related to manure management issues. Mr. Tousaw on behalf of the Huron County Planning and Development Department prepared a report dated September 27, 1997. This report concluded that:

> an interim control by-law which would suspend (certain) agricultural activity in the Township while studying its environmental effects would not conform with the Huron County Official Plan and the Ashfield Township Secondary Plan and is not consistent with the community directions in the draft new County Official Plan. The planning rationale does not support a moratorium on new livestock facilities because the issues are related primarily to management practices rather than land use issues. ... There is insufficient planning rationale to reasonably expect a study to provide meaningful direction for changes in the municipality's land use planning policies.

¶ 34 The new official plan, the county plan, received third reading on October 1, 1998.

¶ 35 According to the minutes of the June 6, 2000 meeting of Council, Council received a "complaint of irresponsible manure spreading practices" within the Township. Council indicated an intention to consult the Township's solicitor for his recommendation. The minutes go on to note that there was "a general discussion on concerns over the recent events regarding improper manure spreading practices and the possible contamination due to run-off, the inability of the Ministry of Environment to respond in time to run-off situations, and the recent expansion of intensive livestock operations" in the Township. Further to that discussion, a resolution was passed demanding that "the Government of Ontario immediately put in place a moratorium prohibiting the construction of any new liquid manure facilities or the addition to any existing facilities, until it has been proven that the environment and our drinking water will not be negatively affected by them". During her cross-examination, Ms. Andrews was asked when Council "began to seriously discuss the implementation of an interim control by-law ... and when did it turn from something in which they asked the province to act on June 6th" to something that they intended to act on themselves? Her answer to this Q. 61 is as follows:

> A. I think the issue of the moratorium was always on council's mind and you're asking me to determine at what point they chose to act on that?
> Q. 62. Right. When did actions actually start taking place?
> A. I think even at the point in time when they asked the province to implement the moratorium, I think that council had intentions at that point in time to move on that. That was one more step in, in I think their considerations in doing that. They were looking for provincial support in that area.
>
> But I think certainly from that point forward -- I can't speak for council, it is only my interpretation -- that they had, they had a movement to proceed to that end.

¶ 36 At the time the Interim Control By-law was passed on June 26, 2000, the Township had advice from its Senior Planner, Mr. Tousaw, that such a by-law would conform to the Township's Secondary Plan and the County of Huron Official Plan. The resolution passing the Interim Control By-law reflects that the Township Council received an oral report from Mr. Tousaw. That report was later supplemented by a letter dated July 4, 2000

in which Mr. Tousaw states that while much of the 1997 report remains relevant, there are a number of factors which "lend support for interim control on intensive livestock barns in Ashfield Township." He delineated these factors which included "an acceleration of construction of large barns" and conclusively opined that these issues were "sufficiently acute in Ashfield Township to sustain an interim control by-law." Mr. Tousaw's opinion has changed since 1997.

¶ 37 Mr. Todd Brown, a planner retained by the applicant, has sworn an affidavit August 24, 2000 in support of this application. In that affidavit he expresses his opinion that Mr. Tousaw's 1997 opinion that the application of interim control is inappropriate remains valid and that the Interim Control By-law does not conform with the official plan and is therefore illegal pursuant to s. 24 of the Planning Act.

¶ 38 The applicant asserts that Mr. Tousaw's opinion in June 2000 is neither valid nor reliable and does not form a legitimate basis for the Township to pass the Interim Control By-law. The applicant asks me to infer that the basis for Mr. Tousaw's change in opinion is not sound and that his 1997 opinion is correct as supported by the opinion of Mr. Brown. Essentially the applicant asserts that Mr. Tousaw, in changing his opinion, was "caught up in the same swirl" arising from the concerns in Walkerton, Ontario that pervaded the thoughts of the Township Council was caught up in.

¶ 39 In his affidavit sworn in response to this application September 6, 2000, Mr. Tousaw deposes in para. 18 that since 1977 there has been a shift in the agriculture-environment balance which "now lead to a conclusion that there is planning rationale for a pause in the construction of large barns based on liquid manure to consider their effects and regulatory (and other) responses, and that such an interim control by-law does conform with the Official Plan and Secondary Plan." Mr. Tousaw goes on to set out the factors which led him to this conclusion including his opinion that his assumption expressed in the 1997 report that "any additional livestock units added within the interim control period would be relatively small compared to the total township herd size" has proved inaccurate. He further deposes that there has been an unprecedented and unanticipated rate of growth in the Township of intensive operations since 1997. Mr. Tousaw reiterates his opinion in paragraph 23 of his affidavit as follows:

> There is efficient and reasonable planning rationale for the Ashfield Township interim control by-law. The legitimate planning issues arising from the growth and intensification of livestock production and liquid manure fall under the purview of the Planning Act, the Provincial Policy Statement, the County Official Plan, and the Ashfield Township Secondary Plan. The interim control by-law conforms with the Official Plan and Secondary Plan and represents good planning.

¶ 40 Mr. Tousaw was extensively cross-examined on his affidavit on September 29, 2000 and a transcript of that cross-examination made available at the hearing of this motion. He was specifically challenged on the basis for his change of opinion from his 1997 report to his advice in June 2000.

¶ 41 In particular, the applicant asserts that Mr. Tousaw was incorrect in his assertion that the intensification has been beyond what was expected in 1997. Essentially the applicant's position is that the data relating to the year 2000 is consistent with the data from 15 years ago but not with the 1996 data and that data is simply an aberration. In other words, the applicant asserts that intensification would be clearly expected according to the 1996 data. However, as Mr. Tousaw goes on to indicate in his answer to question 216 of his cross-examination "the degree to which we've seen expansion and intensification in Ashfield was unanticipated" and further in response to Q. 217 he indicated:

> ... the expansion of the industry was anticipated. That may not necessarily have occurred in any intensive degree in Ashfield Township or in the County of Huron for that matter ... so while there was an expansion of the industry anticipated, we were unsure how that might play out in Huron County.
> And indeed in Ashfield Township, as I indicated, I believe that it has had the most intensive growth in the County of Huron in the past five years, in terms of the clustering of large barns. ...
> The Township of Ashfield has received a disproportionate portion of that growth. And hence the concerns today.

¶ 42 Further, in response to Q. 385 Mr. Tousaw stated as follows:

> The purpose of putting a freeze on is that the township has continued to experience problems despite its best efforts to regulate the industry in what they feel - and in fact I believe what the industry feels - is a, is quite an appropriate manner. Despite those best efforts they continue to have

> problems. So the purpose for interim control was to pause to be able to study those problems. It's not just to, to put a freeze or moratorium on development for no valid pending reason.

¶ 43 The applicant's position on this application was that I must choose between the opinions of the two planners and given the challenge to Mr. Tousaw's June 2000 opinion, I ought to accept the opinion of Mr. Brown and quash the Interim Control By-law.

¶ 44 The Court of Appeal in Equity Waste Management of Canada v. Halton Hills (Town) (1997), 35 O.R. (3d) 321 (C.A.), indicated that interim control by-laws are an important planning instrument for a municipality. In particular, at p. 337 the court indicated:

> An interim control by-law permits a municipality to temporarily freeze development. Municipalities no longer have to show a previous intention to rezone to defeat the rights of landowners to use their land. A municipality must give notice of a zoning by-law before passing it, but does not have to give notice of an interim control by-law until after it has been passed, thus enabling the municipality to act quickly as necessary to freeze development. Unlike zoning by-laws, which take effect only after approval by the OMB, interim control by-laws take effect immediately upon passage ... They allow the municipality breathing space to rethink its land use policies by suspending development that may conflict with any new policy ...
> Before passing an interim control by-law, a municipality must meet only one statutory condition. Under s. 38(1) of the Planning Act, it must have by "by-law or resolution directed that a review or study be undertaken in respect of land use planning policies in the municipality or in any defined area" of it.

¶ 45 In my view Equity Waste stands for the proposition that an interim control by-law must be supported by an acceptable planning rationale and must conform to the Official Plan. As indicated in Equity Waste the role of the court is limited to ensuring that the municipality did not exceed its powers or exercise those powers in bad faith. I am not obliged on this application to choose between the opinion of Mr. Tousaw and Mr. Brown. In my view, the Township was entitled to rely on Mr. Tousaw's opinion that there was a valid planning reason for a freeze contemplated under the Interim Control By-law and that such would conform to the Official Plan.

¶ 46 With respect to the requirement that the Township direct a review or study, the Township Council, as part of its resolution passing the Interim Control By-law, directed a review or study in respect of land use planning policies, by-laws, regulations and procedures in the municipality regarding the establishment, construction, maintenance, monitoring and management of livestock liquid manure facilities. The applicant asserts that the Township passed this resolution without any serious intention to pursue a review or study. The applicant points to the evidence of Mr. Tousaw on his cross-examination that the meeting to discuss the terms of reference for a study was not called until August 25, 2000. However, as Mr. Tousaw further stated he was on holidays during most of July and part of August and this meeting was arranged upon his return. Mr. Tousaw indicated that in a general sense there had been discussions about pursuing the terms of reference prior to his leaving on holidays. Specifically in answer to Q. 397 he stated as follows:

> It was of course understood by the municipality in their resolution that a study was required. It was understood that the Planning and Development Department would be involved in such a study, and that there would be progress in due course. There were no specific dates set prior to my departure on holidays.

¶ 47 Mr. Tousaw wrote a memo to Ms. Linda Andrew, the clerk treasurer of the Township on September 19, 2000 attaching draft terms of reference. The terms of reference were completed at 10:30 p.m. the evening prior to Mr. Tousaw's cross-examination on his affidavit. The applicant asserts that these terms were prepared in response to its request that the terms of reference be available for review at Mr. Tousaw's cross-examination.

¶ 48 I am not prepared to draw the inference that the applicant asserts - that the Township had no intention of undertaking a review or study - given the resolution passed by the Township Council, the evidence of Mr. Tousaw that his department would be involved in a study, Mr. Tousaw's explanation for the delay in meeting to discuss the terms of reference for the study and Ms. Andrew's disagreement with the suggestion put to her on cross-examination that Council wanted a moratorium on the construction of intensive livestock facilities and the study was an afterthought. Specifically

she stated at question 191 that she didn't think a study was an afterthought and Council was always aware that a study was required under interim control.

¶ 49 Finally, the applicant raises the issue whether it was appropriate for the Township to attempt to deal with what is acknowledged to be a provincial problem within the time period contemplated under the Interim Control By-law given the Township's resources. Mr. Brown expresses his opinion that interim control is not suited to these circumstances and is best suited to isolated cases. Whether Mr. Brown's opinion should be accepted over the opinion of Mr. Tousaw is not an issue to be determined on this application. In accordance with Equity Waste it must be clear that in enacting interim control, the Township had a planning rationale and ordered a study and as earlier noted I am satisfied that the Township met those requirements in this case.

ISSUE NO. 3 - WAS THERE INTENTIONAL WAS ADMINISTRATIVE DELAY?
THERE PROCEDURAL FAIRNESS? SHOULD THE BY-LAW BE STRUCK
BECAUSE IT WAS PASSED IN BAD FAITH?

¶ 50 Earlier in these reasons I applied the case of Equity Waste. The applicant raises the question whether the deferential approach adopted in that case remains the proper one when considering issues such as are raised on this application. In particular the applicant refers me to the review of the authorities undertaken by Reilly J. in Zivkovic v. Kitchener (City), [1999] O.J. No. 806 (Gen. Div.) and the subsequent decision of the Supreme Court of Canada in Baker v. Canada (Minister of Citizenship and Immigration), [1999] 2 S.C.R. 817 in which the Supreme Court of Canada provided guidance on how the duty of fairness may arise. The applicant asserts that the circumstances surrounding the passage of the Interim Control By-law suggest a standard of review requiring correctness. However I am of the view, as Reilly J. concluded in Zivkovic, that a deferential approach as enunciated in Equity Waste should be applied to the review of the passage of the Interim Control By-law in issue on this application and remains the law of Ontario.

¶ 51 In considering the issues raised on this application I note that as set out in Equity Waste the onus is on a party seeking to quash a by-law to prove bad faith.

¶ 52 The applicant asserts that there was intentional delay in the processing of this application to allow the Interim Control By-law to be passed and that this application was the precipitating factor for the passage of the Interim Control By-law. The applicant relies on the evidence of Mr. Maize on cross-examination in answer to Q. 240 - 241:

> Q. 240. Was there any discussion about -- first of all council as they discussed Interim Control were told by you or somebody else that the Country Pork application was there at that moment, correct?
> A. Yeah, that would be correct.
> Q. 241. That was a precipitating factor for the discussion, as you understood it, correct?
> A. Yes.

¶ 53 The applicant acknowledges that that evidence from Mr. Maize is different from the evidence of the Reeve, Mr. Van Diepenbeek and the other Councillors.

¶ 54 The minutes for the meeting of the Township Council on June 20, 2000 indicate that pursuant to the motion of Ms. Miltenburg as seconded by Ms. Black, Council proceeded into closed session to discuss legal matters with the Township solicitor and Mr. Tousaw, the Township's planner. On her cross-examination, Ms. Andrew testified that she agreed with Mr. Tousaw's evidence that she had called him on June 19th and discussed the drafting of an interim control by-law and that she had done so "not necessarily on anyone's instructions". In response to the question whether she knew that interim control was going to be the subject of discussion on June 20th, she responded as follows:

> I think, yes, I, I would have to say that I was certainly assuming that it would be up for discussion at that meeting.

¶ 55 Ms. Andrew in cross-examination indicated that interim control was discussed hand-in-hand with the Nutrient Management Plan of the Applicant. As Ms. Andrew testified, she was given direction at the June 20th meeting to proceed with the interim control process, including instructing Mr. Tousaw to draft the appropriate resolution and by-law.

¶ 56 Mr. Van Diepenbeek provided the following evidence on his cross-examination with respect to the context of the discussions on interim control:

Q. 56. You were discussing Interim Control in closed session in the context of County Pork's building permit application, fair enough?

A. I don't think that we, that was the intent. The Interim Control By-law was before us. The fact that we had Country Pork's building application or the Nutrient Management Plan there, that is not the sole reason why we went ahead with the Interim Control By-law. We've had, like I said, we've had a lot of pressure.

Q. 57. You say not the sole reason you went ahead. Was it one of the reasons you went ahead?

A. Because we've had a lot of public pressure. In light of the Walkerton issues. In light of the Ministry of Environment investigations on a couple of properties in Ashfield. There was a various amount of reasons. There was a lot of concern about wells being polluted and our water quality being deteriorated.

Q. 58. But if I interpret your answer correctly, when you say County Pork's building permit application was not the sole reason you went ahead with the Interim Control By-law, but it was one of the reasons.

A. Ah, not really, no. I don't think it was. I think it was something that was in the works anyhow, regardless of whether that application had been there or not.

Q. 59. Did the Country Pork application have anything to do with the timing associated with the passing of the Interim Control By-law.

A. In what way?

Q. 60. Well, as you said earlier, this had been an issue for three years at least in the municipality. Walkerton was an early May event. The problems with Acre T were May, 1999. Nothing was happening on May 23rd. On June 6th you had asked the Government of Ontario to act. Now you're deciding to act on your own. And I am looking for the precipitating event in terms of timing. Was it the Country Pork application?

A. I don't think it was, no.

Q. 61. Well, what was it?

A. The, all the other events that led up to it. We were already well into it by then.

¶ 57 Under cross-examination, Mr. Simpson indicated that the Township had considered a "moratorium", as he referred to it, for a considerable period of time. The applicant's theory was very definitively put to Mr. Simpson in Q. 29:

Q. 29. And I'm not, I'm not beating around the bush here, because to me sitting on the opposite side of the table it looks like the June 16th application of Country Pork probably initiated that process, in terms of making it immediate. Is that right?

A. No. The, the application? We, I can tell you very clearly that I did not go into the meeting of June 20, find out there was an application, and say, let's put a moratorium on.

Q. 30. You knew about the Country Pork Building Permit Application before June 20th.

A. No, I did not. I learned of it at the meeting.

¶ 58 Mr. Simpson was also asked specifically whether any of the actions of council associated with the application between June 20th and June 26th were designed to delay the applicant until the Interim Control By-law could be put in place and Mr. Simpson's clear response was "No. No, I would say that that would not be the case". In fact, in response to previous questions Mr. Simpson indicated that he wasn't clear that the Interim Control By-law would stop the applicant "in its tracks" although he was candid in acknowledging that he hoped it would. He was not prepared to agree with the suggestion that he presumed that it would. He testified that it was not clear to him one way or the other but he "knew that the time had come to put in an Interim Control By-law."

¶ 59 Ms. Black's evidence was that she did not have an understanding that the Interim Control By-law was put on the June 20th meeting agenda as a consequence of the applicant. Mr. McKeon was unable to remember any discussion with respect to the applicant before the Interim Control By-law was passed.

¶ 60 The applicant asserts that the councillors' denial that the application by the applicant triggered the passage of the Interim Control By-law is not credible. The applicant asserts that the evidence of the Reeve and Ms. Miltenburg that in their view the applicant was rushing through its application to avoid the possibility of interim control was "rehearsed".

¶ 61 The applicant also asserts that the Township's discussions on June 20th ought to have been in public and if part of the meeting was to be closed to the public, Council was obliged to state the general nature of the matter to be considered at the closed meeting in the resolution referencing the closed meeting (see s. 55(3)(5) & (7)) of the Municipal Act. There is no question that each of the councillors indicated on their examinations that they did not consider giving notice to the applicant or their consideration of the Interim Control By-law and they did not turn their minds in any way to any obligations of procedural fairness.

¶ 62 The applicant points to the following response to questions 303 and 304 on the cross-examination of Mr. Maize in support of its assertions.

Q. 303. Now, from all of those things Country Pork, the applicant, gets a little suspicious that people were stalling its application until after the interim control by-law could be passed. Is that what happened?
A. Well, I can't speak for other people, but it may appear that way.
Q. 304. Does it appear that way to you?
A. Yes.

The applicant asks me to draw the inference that the Councillors were not being truthful and the only rational inference that can be drawn is the one that Mr. Maize came to.

¶ 63 The applicant asks me to infer there was bad faith. The applicant asserts that the Council acted in secret, there was a deliberate administrative delay, there was no notice to the party most directly affected by the passage of the Interim Control By-law and the passage of the By-law was motivated by political concerns. Ultimately the applicant asks that an inference be drawn that the Township Council intervened improperly in the process and deliberately stalled the permit application and passed the By-law to thwart the applicant. The applicant's position is that if Council had acted with procedural fairness the applicant would have ensured that it satisfied the requirements outlined in Mr. Maize's June 21st correspondence and Mr. Murphy's June 22nd correspondence.

¶ 64 As previously noted, the cross-examinations and examinations conducted prior to the hearing of this application were extensive. Each Councillor denied any intentional delay or interference with Mr. Maize's discretion and denied the suggestion that the By-law was passed because of the application. In the face of that evidence, I consider it inappropriate to draw the inferences suggested by the applicant. With respect to Mr. Maize's answers to questions 303 and 304, in my view his responses can be interpreted as an agreement that the applicant may well find the circumstances suspicious, but that he could not speak for others. I do not take his response to Q. 304 as an expression of his opinion that the application was being stalled until after the Interim Control By-law could be passed. Indeed, as Mr. Maize deposes in his affidavit, the three previous applications referred to by Mr. Ueckermann in his affidavit were dealt with over a period of nine days, 16 days and 21 days. On that basis Mr. Maize denies that he delayed the application given that only 10 days elapsed between his first meeting with Mr. Ueckermann June 16th and the passage of the Interim Control By-law on June 26th.

¶ 65 Further, there is simply no evidence of delay between June 20 when the Interim Control By-law was being considered and June 26th when it was passed. Indeed on June 21st and June 22nd the applicant was advised of the requirements that had to be fulfilled for the permit to be issued.

¶ 66 Interim control was first discussed June 6th but not passed until June 26th. In examination both Reeve Diepenbeek and Councillor Miltenburg expressed their opinion that the applicant was rushing its building permit because of the potential for some type of moratorium to be enacted provincially or by the Township in view of recent events.

¶ 67 Section 38 of the Planning Act clearly authorizes the Township to proceed to pass an interim control by-law without giving prior notice of its passage. The issue of whether, under a duty of procedural fairness, the Township ought to have given the applicant notice has been raised on this application. In my view, the fact that the applicant had the opportunity to petition the Township for an exemption from the By-law and was heard in that respect on July 6th provides procedural fairness to the applicant. Further as noted by the Court of Appeal in Equity Waste the requirement for a study, the right to appeal an interim control by-law to the Ontario Municipal Board and the two year limit on such by-laws provide adequate safeguards against abuse. In reaching my conclusion I am mindful of the conclusion of the Court of Appeal in Equity Waste at p. 337-338 that the motions judge "erred in burdening the Town's use of an interim control by-law with other conditions not required by statute".

¶ 68 Certainly the timing of the passage of a by-law (see 1121472 Ontario Inc. v. Toronto (City) (1998), 39 O.R. (3d) 535 (C.A.) citing Equity

Waste) and how it was passed - that is its reading three times at one meeting (see Markham v. Sandwich South (Township), [1998] O.J. No. 2183 (C.A.)) are relevant factors going to good faith. These factors were particularly significant to the Court of Appeal's finding in Markham that "the timing of the passage of the By-law ... indicates that the By-law was passed in bad faith to avoid a motion for summary judgment that might well have been lost due to the unenforceability of Resolution 351/85 and to avoid the result of the overall lawsuit that was likely to be lost". However, in 1121472 Ontario Inc. the Court of Appeal held that the timing of the by-law "must be seen in context" and in that case no context was provided. The Court indicated that there should be evidence of circumstances surrounding its enactment, the planning rationale that provides the basis for the recommendation that a study be undertaken and evidence as to when the matter first became the subject of municipal consideration and the problems giving rise to the consideration. On this application I have before me evidence of the nature described by the Court of Appeal in 1121472 Ontario Inc. and therefore can review the timing of the by-law in context. That was the approach undertaken by Rosenberg J. in Luxor Entertainment Corp. v. North York (City) (1996), 27 O.R. (3d) 259 (Gen. Div.), where while a hearing for an order that a chief building official was obliged to issue a building permit was adjourned, an interim control by-law prohibiting the use proposed by the applicant was enacted without planning advice. In my view the context of this application is distinct from what was considered in Markham and in Luxor Entertainment Corp. Here there is no evidence the Township Council acted unreasonably and arbitrarily and without the degree of fairness, openness and impartiality required of a municipal government to use the language of the Court of Appeal in Equity Waste. There is no evidence the Council was motivated by self-interest or that they acted in other than the public interest. The applicant's property was not singled out. I have found that the June 16th meeting between Mr.Ueckermann and Mr. Maize did not trigger the passage on the Interim Control By-law. I have found that the Township had a planning rationale for the By-law and the study to be undertaken and that the study was not an "afterthought".

¶ 69 As set out earlier in these reasons the applicant also takes the position that the By-law is ultra vires the Township's powers because the provisions of the By-law are contrary to the Farming and Food Production Protection Act. This argument raises the question whether the Interim Control By-law restricts a "normal farm practice" as contemplated by s. 6(1) of the Farming and Food Production Protection Act. That section provides that no municipal by-law can be applied to restrict a normal farm practice. I do not consider the Interim Control By-law as restricting such a practice. To use the words of the Court of Appeal in Equity Waste, an interim control by-law allows a municipality "breathing space to rethink its land use policies by suspending development that may conflict with any new policy". Therefore the Interim Control By-law is not the type of restriction contemplated in s. 6(1) of the Farming and Food Production Protection Act.

¶ 70 For the foregoing reasons I am satisfied that the Interim Control By-law ought not to be quashed. The application is dismissed. If necessary Counsel may make submissions on the issue of costs by filing brief written submissions within thirty days of the date of release of these reasons.

LEITCH J.

Giangregorio v. Hamilton (City)

Between
Lucy Giangregorio, applicant, and
The Corporation of the City of Hamilton and John Lane, Jim Sallas and Jill Sallas, respondents

[2001] O.J. No. 5670
Court File No. 01-4377

Ontario Superior Court of Justice
Matheson J.

Heard: June 25, 2001.
Judgment: June 27, 2001.

Counsel:

John A. Crossingham, for the applicant.
Nancy L. Smith, for the respondents, The City of Hamilton and Peter Lampman.
Sean Lawler, for the respondents, Jim Sallas and Jill Sallas.

¶ 1 **MATHESON J.** (endorsement):— Order to allow extension of time to bring application pursuant to Section 25(3) of the Building Code. On consent to change style of cause replacing John Lane with that of Peter Lampman and the name of the respondent is the City of Hamilton, not the Corporation of the City of Hamilton.

¶ 2 This is an application brought by Lucy Giangregorio for an order revoking the building permit issued by the respondent Municipality Building Official, Peter Lampman permitting the respondents, Jim Sallas and Jill Sallas to construct a garage at 9 Winona Park Drive and a permanent injunction preventing construction pursuant to that building permit.

FACTS

¶ 3 The respondents, Jim Sallas and Jill Sallas applied for a height increase on the proposed garage. The height was to be increased to 7.55 meters from 4.5 meters to allow for storage and play area for the children; not to allow residential use on the second floor.

¶ 4 At the Committee of Adjustments hearing on May 1st, 2000, the issue of preserving the existing trees was raised by a committee member and not the applicant.

¶ 5 The Committee moved that the application be approved; a 1.25 meter setback. No mention was made of preserving the trees.

¶ 6 The applicant appealed the decision to the Ontario Municipal Board under Section 45 of the Planning Act. On the 15th day of September, 2000, a hearing was held and an oral decision given.

¶ 7 At that hearing the two ash trees were discussed. The Board refers to them in the second full paragraph on Page 4 of its decision:

> "Concern was expressed for the preservation of two large trees located along the lot line. No evidence was provided to indicate that this proposed garage would affect the trees in any way."

¶ 8 In its decision, the Board allowed the Committee of Adjustments to proceed deleting the condition imposed by the Committee of Adjustments of a 1.5 meter setback. It also imposed four conditions; condition #2 is the one matter that gives rise to this application. It reads as follows: "That an Arborist report indicating the steps to be followed in preserving the two trees in question, be submitted to the City's satisfaction prior to drainage certification".

¶ 9 Beswick Tree Service Ltd. provided a letter to Jim Sallas dated September 27th, 2000 which is found at Tab 1.E of the Responding Record of the Sallas'. It stated in part: "It is our opinion that those trees will not survive", and later "we feel that the damage from the construction will be too severe and that they will have to be removed."

¶ 10 This was given to the City on February 12th, 2001. On March 21st, 2001, a building permit was obtained to construct the new garage. On June 12th, 2001 work started on the construction. The sub-contractor indicated that a swale had to be built and thus the trees would have to be removed, taking into account the damage done to the root system.

¶ 11 The applicant and his solicitor attended on the Respondent City to issue a stop work order. This was denied. The trees were cut down.

¶ 12 The condition of the trees created a danger and the order to remove them at that time was reasonable.

PROCEDURE

¶ 13 Anyone who feels aggrieved by an order under the Building Code Act may appeal to a Judge of the Superior Court of Justice within 20 days per Section 25(1) of the Building Code Act. That has been complied with.

¶ 14 Section 43 of the Ontario Municipal Board Act allows the Board to "rehear any application before deciding it or may review, rescind, change, defer or vary any decision, approval or order made by it". New evidence is one of the grounds that the Board may take into account on a new application.

¶ 15 A judge on an appeal may substitute his decision for that of the OMB.

STANDARD OF RENEW

¶ 16 This Court is sitting as a Court of Appeal from a decision of the Building Official to grant a building permit.

¶ 17 The applicable standard of review is set out in the case of Runnymede Development Corp. v. 1201262 Ontario Inc. 47 O.R. (3d) 374 at page 383: "[20] One of the few cases to have dealt specifically with the applicable standard of review is the decision of Stinson J. in William F. White Ltd. v. Toronto (City) Chief Building Official, 44 O.R. (3d) 750, supra. In that case, Stinson J. considered a number of relevant authorities and stated (at p. 760): I conclude that an appellant under s. 25 of the [Building Code Act] has the burden of demonstrating by means of evidence placed before the court that the decision below was not reasonable or that it was wrong as a matter of law. In attempting to discharge that burden the appellant may tender additional evidence before the court, as may the respondents to the appeal. [21] Stinson J. held that a decision of the Chief Building Inspector would be set aside if it was "wrong as a matter of law". Therefore, where issues of legal interpretation are concerned, he would apply a standard of correctness. On other questions, Stinson J. held that a standard of reasonableness should be applied. In coming to this conclusion, he relied, in part, upon the decision of Hoilett J. in Griffen v. Teplitsky, [1999] O.J. No. 1552 (Gen. Div.), online: QL, a decision involving an appeal from the tribunal under the Health Care Consent Act. Stinson J. cited with approval the following excerpt from Griffen v. Teplitsky, supra, at para. 13: "Concerning this court's jurisdiction, it is worth noting that although the court may treat this appeal as a hearing de novo the court's fundamental role as an appellate tribunal has not changed. That fact is particularly germane, where as here, no new evidence has been adduced. It is my view in those circumstances, that the customary restraint appropriate for an appellate tribunal should be exercised. In other words, the fundamental issue to be addressed is to determine whether or not the board's decision was reasonable on the evidence having regard to the legal principles applicable. Stated otherwise, it is not this court's role simply to substitute its decision for that of the board's simply because it may, or even would have arrived at a different decision had it been the tribunal of first instance."

ARGUMENT OF APPLICANT

¶ 18 The applicant at the Committee of Adjustments did not raise the issue of the trees for what was deemed as strategic reasons, and relied only on the increase height.

¶ 19 It was raised by her at the OMB review, although the applicant did not present any evidence on the trees.

¶ 20 The OMB referred on three occasions to the trees and in its decision it granted the variance with one change and that was the removal of the setback. The Board imposed four conditions: the only one that concerns this application is #2 which reads as follows: "that an Arborist report indicating the steps to be followed in preserving the two trees in question, be submitted to the City's satisfaction prior to drainage certification".

¶ 21 The position of the applicant was that the City and/or the Sallas' should have gone back to the OMB and obtained a clarification. Because that did not happen, the injunction should be made permanent and that the Sallas' not be able to build its garage outside of the regular height limits.

ARGUMENT OF RESPONDENTS JIM AND JILL SALLAS

¶ 22 They obtained an Arborist report as required and provided it to the City as required. They believed notwithstanding the report that they could save the trees.

¶ 23 Therefore, they honoured their responsibility and proceeded to obtain a building permit and hire a contractor.

¶ 24 The events of June 12th, 2001 were outside of their control. The City ordered the cutting down of the trees as a safety concern. It was a reasonable decision. There was no malfeasance on their part.

¶ 25 The preservation of the trees was not connected with the application to vary the height restrictions. Therefore, it was outside the powers of the OMB.

¶ 26 The Sallas' point out that the trees would have been destroyed without the height increase of the building. They could have taken them down because they were on their property or on the lot line.

¶ 27 The applicant is trying to impose a new condition when her objection to the height restrictions was turned down.

ARGUMENT OF THE CITY OF HAMILTON AND PETER LAMPMAN

¶ 28 The applicant has taken the decision of the OMB out of context.

¶ 29 The OMB was trying to placate the Applicant by putting in Condition #2 -- the Board transferred the condition to the City and it was fulfilled when the Sallas' provided the Arborist report.

¶ 30 The Sallas' could have cut down the two ash trees at any time pursuant to the Trees Act, Chapter T.20.

¶ 31 The OMB was ultra vires by putting in Condition #2 in that no evidence was led by the applicant as to what use the trees would have in respect to the height variance. See the Planning Act, R.S.O. 1990, Section 45(9).

¶ 32 The building inspector could have issued the building permit without looking at the condition.

DECISION

¶ 33 Having reviewed the material filed and hearing from counsel I find as follows:

(a) The Sallas' complied with the OMB order.
(b) The OMB condition with respect to the trees was ultra vires and of no consequence.
(c) The applicant was attempting to use the tree condition to get around the granting of the height increase.
(d) The respondent, Peter Lampman acted within his powers and acted reasonably.
(e) The City did not act outside of its powers.
(f) There was no error in law by the City of Hamilton, Peter Lampman or any of its agents or employees.

¶ 34 Therefore, the injunction will be dissolved forthwith.

¶ 35 The issue of damages and costs, if not agreed to, may be brought back before me.

MATHESON J.

Sapone v. Clarington (Municipality)

Between
Umberto Sapone and Joan Sapone, plaintiffs, and
The Corporation of the Municipality of Clarington, Eridanus Industries Inc. and Wayne Earnest Conrad, defendants

[2001] O.J. No. 4991
Court File No. 6746/01

Ontario Superior Court of Justice
Lane J.

Heard: September 20, 2001.
Judgment: December 18, 2001.

Counsel:

Irving Marks and David Taub, for the defendant Clarington, moving party.
Umberto Sapone, for the plaintiffs, responding party.

¶ 1 **LANE J.** (endorsement):— The defendant Clarington moves to strike out the Statement of Claim and dismiss the action against it on the ground that it does not disclose a cause of action against Clarington. The other defendants take no position. The plaintiffs seek damages and punitive damages against Clarington by reason of the construction and use of certain buildings on a property adjacent to their own by the other defendants. The plaintiffs say that the municipality, Clarington, has negligently failed to enforce its own by-laws, ignored the plaintiffs' concerns and "turned a blind eye" to illegal use of the adjacent lands, thereby causing a nuisance.

¶ 2 The plaintiffs reside in a home located one house north of property owned by the defendant Mr. Conrad and adjacent to other property owned by the defendant Eridanus, a corporation owned by him. I will refer to all of these lands as the Conrad property. The area is zoned as a rural hamlet for single family dwellings only. The Conrad property was originally a 2800 s.f. home like those around it. In the early 1990's, the defendant Conrad applied for and was granted building permits by Clarington for a substantial extension doubling, if not tripling the size of the house. There is also a 2 metre high concrete wall around the property built at the same time.

¶ 3 The plaintiffs say, in paragraph 17, that this property does not comply with the zoning because it is being used for business with numerous people working there day and night, and not as a single family dwelling. They further say, in paragraph 19, that Clarington has failed to comply with their request to investigate and report on the nature of the use of the Conrad property. In paragraph 21, the plaintiffs say that the Conrad building is an eyesore out of character with the vicinity, and is a nuisance because it blocks their view, emits noise, light and fumes and discharges unknown substances onto the plaintiffs' property, damaging their cedar trees. In paragraph 22. the plaintiffs say that the wall contravenes the zoning by-law and that the building is being used for business. In paragraph 23, the plaintiffs say that the numerous cars entering and exiting at all hours, helicopters hovering, brilliant security lights and constant patrolling by security guards have all given rise to apprehension and loss of a sense of security. In paragraph 24, the plaintiffs say that all of this has been caused by the negligence of Clarington in that it failed to enforce the zoning by-laws, ignored the plaintiffs' concerns and turned a blind eye to the business use of the Conrad property.

¶ 4 In paragraph 26, the plaintiffs plead that Clarington: issued building permits for the Conrad property "knowing that the said permits did not comply with the letter and spirit" of the zoning by-law; has known since the early 1990s of the use of the property and has failed to enforce the by-law; knew or should have known that Conrad would use the property for business; has totally disregarded the plaintiffs' concerns as to the eyesore and the nuisance to the plaintiffs; and, in spite of the plaintiffs' concerns, issued further building permits to Conrad. In paragraph 27, the plaintiffs allege that in doing these things, Clarington failed to exercise the standard of care to be expected and thereby facilitated the illegal use of the Conrad property. Finally, in paragraph 28, the plaintiffs say that Clarington acted in a high handed manner and in bad faith by allowing Conrad to circumvent the rezoning process required to establish a business use in this residential area and by abusing its discretionary power and abdicating its duty to the plaintiffs to enforce the by-law.

¶ 5 On a motion such as this, the court must accept the facts as alleged in the Statement of Claim, unless clearly ridiculous or incapable of proof, and read that document generously: Toronto-Dominion Bank v. Deloitte, Haskins & Sells (1991), 5 O.R. (3d) 417 at 419, (O.C.G.D.). The court should not dispose at this stage of matters of law not fully settled: R.D. Belanger & Associates Ltd. v. Stadium Corp. of Ontario Ltd. (1991), 5 O.R. (3d) 778 at 782 (C.A.). It must appear plain and obvious to the motions

judge that even if the facts pleaded are proved, there is no reasonable cause of action: Hunt v. Carey Canada Inc., [1990] 2 S.C.R. 959 at 980.

¶ 6 It is apparent that much of this pleading is in the language of the law of nuisance. In his oral submissions, Mr. Sapone said that his case was that the municipality had issued a building permit when it ought not to have; the building itself was a nuisance. Since 1990 Clarington had known of the business use and went ahead and issued more building permits in 1999 despite the plaintiffs' objections.

¶ 7 Counsel for Clarington submitted that a municipality cannot be liable in nuisance to a landowner where it does not occupy the land from which the nuisance emanates. It is certainly true that nuisance is normally an action brought against a neighbouring landowner based upon some use being made of that land. The municipality here is not the occupier of the offending lands. It is possible, in some circumstances, for a non-occupier to become liable. In Jackson v. Drury Construction Co. Ltd. (1975), 4 O.R. (2d) 735 (C.A.) the court held that a road contractor whose blasting operation broke open fissures in rock which enabled pig farm effluent to pollute the plaintiff's well, was liable in nuisance even though he was not the occupier of the pig farm from which the effluent came. His non-natural use of the nearby county road had directly caused the problem. Dubin J.A. said that in an action for nuisance, liability attaches to anyone who either creates or causes a nuisance, and the cause of action is not dependent on that person being in occupation of the lands from which the nuisance emanates.

¶ 8 In the present case, while the majority of their pleading revolves around the use of the premises, the plaintiffs have pleaded that the building itself causes a nuisance by obstructing their view, and that certain pipes discharge effluent onto the plaintiffs' lands. They further submit that Clarington made this nuisance possible by granting building permits "knowing that the said permits did not comply with ... the by-law." (paragraph 26(i)). If that last sentence were proved, it is not plain and obvious to me that a municipality could not be liable for the results of such an act. The principle in Drury may not be broad enough to encompass a municipality issuing a permit, because in Drury there is reference to the defendant's non-natural use of the road, so that there was an occupation of land in the vicinity involved. But this stage of the action is not the place to resolve such issues of law. I think therefore, that paragraph 26(i) should stand.

¶ 9 Much of the plaintiffs' complaint is that Clarington knows of the illegal use and will not enforce the by-law and put an end to it. Counsel for Clarington submitted that there was no legal duty on a municipality to a ratepayer to enforce a by-law. He referred me to Toronto (City) v. Polai [1970] 1 O.R. 483 (C.A.), aff'd [1973] S.C.R. 38. In that case the City, as a result of wartime housing shortages, had adopted the practice of not enforcing zoning by-law restrictions on multiple family use of single family dwellings. In the postwar period, some such properties were placed on a `deferred' list and were not prosecuted for violating the by-law. Other property owners in the same area were prosecuted for the same offence and one of them defended an action by the City for an injunction on the basis that the City was discriminating against her. The action was dismissed and the City appealed. The appeal was allowed. All three Judges wrote reasons and all referred in one fashion or another to the discretion possessed by the City as to whether to prosecute or not.

¶ 10 Schroeder J.A., at pages 490-1, likened it to the discretion possessed by the Attorney-General when acting as parens patriae, where the decision to prosecute or not could not be challenged in Court. He also observed that "the mere passing of a by-law by a municipal corporation does not cast any legal duty on the municipality to see to its enforcement." He referred to Brown v. Corporation of the City of Hamilton (1902), 4 O.L.R. 249, where the plaintiff was injured by exploding fireworks which were discharged contrary to a by-law prohibiting setting off fireworks in the streets. The plaintiff argued that he had a cause of action against the City because the City had long disregarded the by-law, to the knowledge of its officers and took no steps to enforce it. Chancellor Boyd said that this was a novel proposition, contrary to all authority except in Maryland, and that: "Having enacted such a by-law, there is no duty cast on the municipality to see to its enforcement."

¶ 11 Jessup J.A. said at page 497, that, in the absence of evidence of impropriety in the administration of the deferred list, the City must be assumed to have: "... exercised bona fides the discretion they undoubtedly have in the enforcement of the City's zoning enactments." He also referred to Brown, supra.

¶ 12 Brooke J.A. said, at page 501:

> "Municipal Council has a discretion as to when it will prosecute for a breach of or sue to enforce the provisions of the zoning by-law. To deny the discretion in Municipal Council would be

> to place the most technical breach of the by-law beside the most blatant and to remove from consideration the harm done to the offender and the value to the community of the proposed proceedings when considering when they ought to be taken." Later, at page 502, he said that the Court cannot interfere with that discretion.

¶ 13 The plaintiffs relied on a number of cases demonstrating the existence of a duty of care in municipal inspection of buildings under construction, such as Kamloops (City) v. Neilsen [1984] 2 S.C.R. 2 and Ingles v. Tutkaluk Construction Ltd. [2000] S.C.J. No. 13. They may or may not assist the plaintiffs in their case against the municipality for issuing a building permit knowing that the application did not conform to the zoning by-law, but they do not support the view that merely passing a by-law casts a legal duty upon a municipality to enforce it. They are cases where the municipality has undertaken to inspect for compliance and thereby has come under a duty of care in the conduct of such inspection.

¶ 14 In my opinion Polai is decisive authority against the plaintiffs' reliance upon Clarington having a legal duty to them to enforce the zoning by-law against the other defendants. If there is no legal duty to enforce, it would follow that there is likewise no legal duty to respond to the plaintiffs' complaints by investigating and reporting to the plaintiffs on the activity at the premises of the other defendants.

¶ 15 The Statement of Claim is replete with references to Clarington's failure to respond to the plaintiffs' complaints, or to enforce the by-law. It is likely better that a new document be prepared without these passages than to strike out bits here and there. In the result, the plaintiffs' Statement of Claim against Clarington is struck out, with leave to amend to plead the cause of action referred to in paragraph 26(i).

¶ 16 The defendant Clarington has been substantially successful and will have its costs on a party and party basis, but they will be to it in the cause of the action against it.

LANE J.

Olmstead v. Greenberg

Between
Eleanor Olmstead, plaintiff, and
Marion Greenberg, Richard Samuel, and The Corporation of the City of Toronto, defendants

[2001] O.J. No. 4545
Court File No. 01-CV-205761

Ontario Superior Court of Justice
Day J.

Heard: July 30, 2001.
Judgment: November 21, 2001.

Counsel:

Joyce Harris, for the plaintiff (responding parties).
Christopher R. Dunn, for the defendants (moving parties).

DAY J.:—

NATURE OF ACTION

¶ 1 The personal defendants, Marion Greenberg and Richard Samuel (the "defendants/moving parties) have brought this motion for an order striking out or dismissing the following paragraphs from the plaintiff's Statement of Claim:

(c) a declaration that the roof and eaves troughs on the house located at 7 Strathearn Road, Toronto, Ontario, are in violation of approved site plans, applicable municipal zoning by-laws and building codes;
(d) an Order requiring the defendants Richard Samuel and Marion Greenberg to take all necessary steps in bring the overhanging roof and eaves trough on the west side of 7 Strathearn Road, Toronto, Ontario into compliance with approved site plans, applicable municipal zoning by-laws and building codes;
(e) an Order requiring the defendants Richard Samuel and Marion Greenberg to install a privacy fence on the upper floor balcony of 7 Strathearn Road, Toronto, Ontario;
(f) a declaration that the house located at 7 Strathearn Road, Toronto, Ontario does not comply with the applicable municipal zoning by-laws and building codes;
(g) a declaration that the proposed Structure (defined below) to be constructed on the property of 7 Strathearn Road, Toronto, is illegal as it does not comply with the applicable municipal zoning by-laws and building codes
(h) an order requiring the property located at 7 Strathearn Road, Toronto, be restored to its original grading and elevation.

8. The defendants, Greenberg and Samuel, have permitted the construction of the house contrary to the provisions of the applicable zoning by-laws and the provisions of the Building Code Act, 1992.

15. In addition to the above damages, the plaintiff claims damages for nuisance due to noise, loss of light and loss of privacy, the particulars of which are as follows:

(d) The defendants, Greenberg and Samuel, have built the house too high, too large and too close to Strathearn Road, and too close to the plaintiff's house, in violation of existing zoning and other applicable by-laws, whereby she no longer enjoys the amount of light that had previously shone on her property.
(e) The defendants, Greenberg and Samuel, are planning to construct a structure in their backyard which is at a higher elevation than the plaintiff's backyard, thereby reducing the amount of light which has always shone on the plaintiff's backyard, which may cause further flooding and will reduce the plaintiff's quiet enjoyment of her property.
(f) The plaintiff's privacy has been unduly disturbed as a result of the house's second story deck, which overlooks the plaintiff's property. This invasion of privacy will be further exasperated when the structure is built.

17. Instead of viewing a lawn and trees outside of her eastern windows, the plaintiff now views the house. Further, after the structure is constructed on the property, she will be viewing from the south windows a high series of retaining

walls alongside the edge of her backyard, instead of a grass hill and trees.

FACTS

¶ 2 The plaintiff, Eleanor Olmstead, owns and occupies the property at 9 Strathearn Road, Toronto. The defendants/moving parties bought the home at 7 Strathearn Road, Toronto, next door to that of the plaintiff. Both properties are on the ravine side of Strathearn Road. The defendants/moving parties demolished the home at 7 Strathearn Road and constructed a large home which contravenes the relevant zoning by-laws in size and height, and in proximity to the plaintiff's home and to Strathearn Road. It also occupies green open spaced districts land.

¶ 3 The plaintiff asserts that the City of Toronto has failed to enforce the zoning by-laws, failed to enforce the approved site plan and did not require the defendants/moving parties to seek approvals for variances from the Committee of Adjustment.

¶ 4 The plaintiff claims that as a result of the failure of the defendants/moving parties to comply with applicable by-laws and failure of the City to require compliance, the plaintiff has been damaged in a number of respects, including enduring a number of floods coming from the defendants/moving parties property, changing the character of the neighbourhood, violating the plaintiff's right to quiet enjoyment of her home, causing emission of noxious odours and noise, and infringing upon the plaintiff's residential amenities, adversely affecting her light, privacy and views.

¶ 5 It would appear that the claims of the plaintiff can be categorized into two classes of allegations: first, that the defendants/moving parties home was built in violation of the applicable legislation; this includes the relevant zoning by-laws and Building Code Act, 1992; for these violations the plaintiff claims that both the defendants/moving parties and the City of Toronto should be held liable. Second, that construction by the defendants/moving parties constitutes a nuisance as it interferes with the use and quiet enjoyment of her property; construction has caused water to flow onto her land resulting in consequent damages, created noise, and has caused loss of light, privacy and aesthetic enjoyment with respect to her home.

ISSUES

1) The principles applicable to the present motion;
2) Jurisdiction to deal with the Ontario Building Code; and
3) Claims based on loss of light, loss or privacy and loss of view.

FINDINGS

1) The principles applicable to the present case

¶ 6 On a motion to strike out a pleading or part of a pleading for failure to disclose a cause of action being frivolous, vexatious, or otherwise an abuse of process of the court, the following principles are applicable:

a) The allegations of fact contained in the Statement of Claim, unless patently ridiculous and incapable of proof, must be accepted as proven;
b) The moving party, in order to succeed, must show that it is plain, obvious and beyond doubt that the plaintiff could not succeed at trial;
c) The novelty of the cause of action will not militate against the plaintiff; and
d) The Statement of Claim must be read generously with allowance for inadequacies due to drafting deficiencies.

See Nash v. Ontario (1995), 27 O.R. (3d) 1 at 6 (C.A.) and Hunt v. Carey Canada Inc. (1990), 74 D.L.R. (4th) 321 at 336 (S.C.C.).

2) Jurisdiction to deal with breaches of the Ontario Building Code

¶ 7 Pursuant to section 3 of the Building Code Act, 1992, C. 23, each municipal counsil in Ontario is granted exclusive responsibility to enforce the Act within its territory. The Act provides that this is to be accomplished through the appointment of a chief building official and building inspectors:

3(1) The counsel of each municipality is responsible for the enforcement of this Act in the municipality.
(2) The counsel of each municipality shall appoint a chief building official and such inspectors as are necessary for the enforcement of this Act in the areas in which the municipality has jurisdiction ...

¶ 8 Section 25, (1) and (2) provide as follows:

> 25.(1) Any person who considers themselves aggrieved by an order or decision made by an inspector or chief building official under this Act or the regulations, except a decision not to issue a conditional permit under subsection 8(3), may within twenty days after the order or decision is made, appeal the order or decision to a judge or the Ontario Court (General Division).
>
> (2) A judge to whom an appeal is made may, upon such conditions as the judge considers appropriate, extend the time for making the appeal before or after the time set out in subsection (1), if the judge is satisfied that there is reasonable grounds for the appeal and for applying for the extension.

¶ 9 The defendants/moving parties take the position that the plaintiff's right to redress to the court for the defendants/moving parties' alleged violation of the building code is limited to an application for review of the decisions of Toronto's chief building official in issuing or failing to issue the defendants/moving parties a building permit and approving of construction of their home and pool. This right must be exercised within twenty days of the date of such decision. In the normal course, the aggrieved party would be the applicant, and the City of Toronto would be the respondent. The defendants/moving parties point out that the plaintiff has not made application for such relief, but has instead commenced an action seeking declarations that the construction of the defendants/moving parties' home violated the building code, and seeking orders that such violations be rectified. They claim that the court has no jurisdiction to entertain such an action. In support of this position, the defendants/moving parties cite French v. Rank City Wall Canada Ltd. (1984), 6 O.A.C. 145 (C.A.) and Ziegler v. Sherkston Resorts Inc. (1996), 4 C.P.C. (4th) 225 (Ont. Gen. Div.).

¶ 10 To support their position that where enforcement of legislation is assigned by the legislature to a statutory body, no right of action to the court for enforcement of such legislation is permitted except as provided by the statute, and any action not in compliance with the legislation will be dismissed. The defendants/moving parties cite Woodglen & Co. Ltd. and City of North York et al (1983), 42 O.R. (2d) 385 (Div. Ct.). In that case the plaintiff made an application for judicial review of the issuance of a building permit, seeking a writ of mandamus, and it did not apply under s. 25 of the Act (then s. 15) to appeal that decision. Even though the application was similar in both form and substance to the right of appeal provided by the Building Code Act, 1992, the application was dismissed on the basis that the proper forum was a section 25 application (then s. 15), as provided by the Act.

¶ 11 The plaintiff takes the position that the courts' jurisdiction is not ousted by section 25 of the Building Code Act. She claims that the section is intended to provide some judicial review of decisions of the chief building official in dealings between the chief building official and the owner of the property directly affected by his or her decisions. Typically, disputes coming before the court by way of section 25 of the Ontario Building Code, will be situations similar to the Woodglen case, cited by the defendants/moving parties, in which the owner of land was aggrieved by the failure of the building commissioner to issue a building permit and sought judicial review. In that case, it was held that the owner ought to have appealed under section 25 of the Code, rather than seeking judicial review and, since the owner had adequate statutory remedy, the court declined to exercise jurisdiction to grant judicial review.

¶ 12 The plaintiff argues that section 25 of the Code is not designed to oust the jurisdiction of this court to deal with complaints by neighbours indirectly affected by dealings between the chief building official and the land owner. Indeed, it would be difficult to imagine that it could work effectively in such cases in that the neighbours affected would have no knowledge of the decisions involved from time to time by the chief building official as the building project progresses to completion. Thus, the neighbours could not be expected to appeal such decisions in a timely way as required under ss. 25(1).

¶ 13 At this point, I refer, parenthetically, to subsection 25(2) which allows the judge to whom an appeal is made under subsection 25(1) to extend the time for making the appeal if the judge is satisfied that there is reasonable grounds for the appeal and for applying for the extension. It should be noted that this court is not at that place because it is not dealing with an appeal under subsection 25(1) of the Code for the reasons above set out in expressing the plaintiff's position. Subsection 25(2) is cited merely to point out that even if subsection 25(1) was applicable the 20 day limitation period is not absolute.

¶ 14 Neither French nor Ziegler, supra, cited by the defendants/moving parties in support of their argument that this court lacks jurisdiction, in fact, deal with the Ontario Building Code. Rather, they deal with rent control

situations arising under the Residential Tenancies Act and under the Rent Control Act. Moreover, both cases involved disputes between landlord and tenant directly and did not involve claims asserted by those indirectly affected by decisions made within a statutory scheme.

¶ 15 The plaintiff takes the position that it is clear from the statement of claim and the particulars provided in reply to demands for particulars by the defendant City of Toronto, that the Building Code violations are pleaded out of an abundance of caution and to protect the plaintiff's position once she has a chance to inspect the plans and specifications for the structure under complaint. In contrast to the pleading of Building Code violations, the statement of claim and the particulars specifically identify itemized breaches of the zoning by-laws and of the site plan.

¶ 16 On the issue of jurisdiction to deal with the Building Code, given these observations, I find that, on this motion to strike, the court ought not to accept an argument that its jurisdiction is ousted:

a) in the absence of any judicial authority compelling such a conclusion interpreting s. 25 of the Code;
b) in the absence of any judicial authority considering a claim by a neighbour that a land owner and the municipality have permitted an illegal structure to be erected on the land owner's property; and
c) on the grounds that courts have always been reluctant to accept an argument, the effect of which is to oust the jurisdiction of the court.

See 80 Wellesley St. East Ltd. v. Fundy Bay Builders Ltd., [1972] 2 O.R. 280 (C.A.) and Michie Estates and City of Toronto, [1968] 1 O.R. 266.

3) Claims based on loss of light, loss of privacy and loss of view

Loss of Light

¶ 17 The defendants/moving parties position with respect to the loss of use of light is based on section 33 of the Limitations Act R.S.O. 1990, c. 0.15 , which provides that no person has a right to use light unless they meet the precondition of acquiring such right by 20 years use prior to the 5th day of March 1880 vis:

> 33. No person shall acquire a right by prescription to the access and use of light or to the access and use of air to or for any dwelling-house, work-shop or other building, but this section does not apply to any such right acquired by twenty years use before the 5th day of March, 1880.

¶ 18 In support of that position the defendants/moving parties cite Earl Putnam Organization Ltd. v. Macdonald (1978), 21 O.R. (2d) 815 (C.A.), at page 818:

> The law is clear that a land owner may so build on his land so as to prevent any light from reaching his neighbour's window, unless the neighbour has acquired as easement by way of prescription or by an express or implied grant: see particularly, 14 Hals., 4th ed., p. 99, para. 210, dealing with the nature of right to light. A right to light there is described as a negative easement:
>
> > The difference between the right to light and the right to freedom from smell and noise is that the former has to be acquired as an easement, in addition to the right of property, before it can be enforced; the two latter are ab initio incident to the right of the property.

¶ 19 With respect to loss of aesthetic value and loss of privacy, the defendants/moving parties take the position that neither of these alleged losses disclose a cause of action in nuisance.

¶ 20 The defendants/moving parties cite Re St. Pierre et al and Minister of Transportation & Communications (1983), 43 O.R. (2d) 767 C.A., at pp. 774-775:

> ... What conduct amounts to a nuisance at common law is "incapable of exact definition": Clerk & Lindsell on the Law of Torts, 4th ed. (1971), at p. 571, sums up the nebulous nature of the tort of nuisance in these words:
>
> > There is perhaps no more impenetrable jungle in the entire law than that which surrounds the word "nuisance". It has meant all things to all men, and has been applied indiscriminately to everything from an alarming advertisement to a cockroach baked in a pie. There is

general agreement that it is incapable of any exact or comprehensive definition.

Although it is rare than an owner can recover damages in this kind of case, there are some cases where recovery has been permitted. For example, recovery has been allowed in the following situations:

(a) interference with access to the claimant's property: Re City of Windsor and Larson et al. (1980), 29 O.R. (2d) 669, 114 D.L.R. (3d) 477, 20 L.C.R. 344;
(b) closing or relocating an existing road or street: R. v. Loiselle, [1962] S.C.R. 624, 35 D.L.R. (2d) 274;
(c) altering the course of a creek bed: Fried v. Minister of Transportation & Communications (1972), 3 L.C.R. 262.

What is the interference with the St. Pierres' property that has occurred in the present case? It seems to me that it is this: The neighbourhood has changed. The St. Pierres no longer enjoy the peace and seclusion that they formerly enjoyed; they are not subject to the noise from traffic on Highway 100. Their view has been interfered with. They no longer look out over rolling countryside; instead they now look out onto a major traffic artery.
Does this give rise to cause of action in nuisance? Regrettably, I do not think it does.

And in Muirhead et al v. Timbers Brothers Sand & Gravel Limited et al, (1977), 3 C.C.L.T. 1 (Ont. C.) at pp. 6-7:

(1) Unaesthetic Sites

According to Mr. Muirhead, at the time of the purchase of the Claremont property in 1963, it afforded a "magnificent view" of the surrounding pastoral countryside which had been despoiled as a result of quarrying activities referred to above. The plaintiffs' counsel submitted that dispoliation of view resulting from a legal wrong would give rise to a cause of action in nuisance, arguing by analogy from several Canadian, English and American cases. However, I would concur in this regard with my brother Morden in the Walker case, [Walker v. Pioneer

¶ 21 Contrary to the thrust of the law above cited, the plaintiff focuses on the remedies available under the planning regulatory framework which appears to have been ignored by the defendants/moving parties and, indeed, by the City with apparent prejudice to the plaintiff.

¶ 22 The plaintiff submits that these are amenities to which the plaintiff is entitled based on her reasonable expectations arising from the administration of the planning regulatory framework. These amenities are associated with the permitted uses in her zoning district and the minimum standards which must be observed with respect to the development and use of land.

¶ 23 The plaintiff alleges that the defendants/moving parties have failed to comply with the approved site plan and the zoning by-laws. The plaintiff further alleges that the City of Toronto has failed to enforce the minimum standards set by the zoning by-laws and failed to require compliance with the approved site plan and will not acknowledge the defendants/moving parties' contravention.

¶ 24 In the normal course, in a situation in which an owner is proposing to depart from the standards set out in the zoning by-laws, the owner is required by the municipality to make application to the Committee of Adjustment for relief from the discrepancies. In that case, Ontario Regulation 200/96, made under s. 70.1 of the Planning Act, sets out the procedure for minor variance applications and sets out those persons entitled to notice of the applications. Specifically, the plaintiff, who is an owner of land within 60 metres of the property of the defendants/moving parties, would have been entitled to notice pursuant to s. 3(d) of O. Reg. 200/96.

¶ 25 S. 45 of the Planning Act provides, among other things, that there is a right of appeal to the Ontario Municipal Board from any decision of the Committee of Adjustment. It also provides for a proceeding that goes forward as a quasi-judicial hearing at which the plaintiff would have had a full opportunity to call evidence and cross-examine witnesses who were called by the applicants. Had this usual procedure been followed, the

plaintiff would have been afforded a full opportunity to protect the amenities which she enjoys under the zoning by-law standards.

¶ 26 At the Committee of Adjustment and the Ontario Municipal Board, the cases repeatedly have applied considerations which protect amenities, including light, privacy and view. The plaintiff cites four cases as follows.

¶ 27 In Grant v. City of Toronto Committee of Adjustment, [1996] OMBD No. 1160 (July 26, 1996) at paras. 37-48, the Ontario Municipal Board spoke of "this enshrinement of amenities, including views, through zoning standards, that legitimizes certain established views as an integral part of the bundle of private property rights in a neighbourhood". In the Grant case, the Board refused to allow a variance to build an additional room onto a home in the Avenue Road/Bedford Road area of the City of Toronto based on a challenge by a neighbour, a writer, who used her own back room to write and found that her contemplation of the view aided her creative processes. That view would have been considerably impeded by the proposed addition to the land owner's property. The Board found that the variances requested by the land owner would have caused an unacceptable adverse impact upon the neighbour's "experience of place", especially as it relates to views and openness in the immediate vicinity and the relevant neighbourhood. In particular, the neighbour's property would suffer unduly both as to openness and views because of the size of the proposed addition and the "boxing" it would cause on her property and her "reasonable enjoyment of her property".

¶ 28 In Assaraf v. City of Toronto Committee of Adjustment, [1994] O.M.B.D. No. 1316, 31 OMBR 257 (1994) at pp. 259-60 and at p. 263, the Board considered in some detail the argument that the proposed application for variance and the addition to the structure which it would permit would cause a shadow to fall upon a neighbouring property. For this and other reasons, the Board dismissed the appeal from the Committee of Adjustment which had denied the application for variance. The Board showed in its reasoning and conclusion that variances are a privilege to be bestowed where there is demonstrated justification and the adverse impact in within acceptable limits.

¶ 29 In Milbourne v. City of Toronto, [2000] O.M.B.D. No. 379, 40 OMBR 308 (April 20, 2000) at 311, the Board refused to permit a variance that would have validated a structure. The reason for the refusal to permit the application was because the structure had a significant negative impact upon the views of the neighbours. The Board noted that the by-law in question has put an accent on controlling the house width to ensure the light, view and privacy of the community can be fully enjoyed by everyone".

¶ 30 In Erem v. Town of Richmond Hill Committee of Adjustment, [1994] O.M.B.D. No. 1120, 31 OMBR 186 (August 25, 1994) at pp. 193-194, the applicant for variance wanted to enclosed a swimming pool at the rear of his dwelling and required two variances to do so. At the Committee of Adjustment, he got his variances, but on appeal to the OMB, the OMB allowed the appeal and refused the application for variances. The Board considered the visual impact of the proposal upon the neighbours' property, the impact of shadow, the loss of open space feeling, the "blank wall" view that would deprive a neighbour of "an unobstructed view of the rear yards of the four residences to the west that it now enjoys", and concluded that the enclosure, if erected, "would constitute a clear intrusion and represent an anomaly in the vicinity". Based on its analysis of the relevant factors, the Board found that the proposed swimming pool enclosure had an unacceptable adverse impact upon the existing development in the immediate vicinity and that it was therefore not desirable for the appropriate development or use of the land.

¶ 31 On the issue of claims based on loss of light, loss of privacy and loss of views, while the law presented by the defendants/moving parties is in place and undisputed, for the court to strike pleadings on those grounds at this stage before trial would be to allow the defendants, both the moving parties and the City of Toronto, immunity from what would have been the appropriate due process to which the plaintiff was entitled, eloquently identified by the arguments of the plaintiff set out above. How these conflicting arguments will play out at trial is for another day. In the final analysis, I revert to the first finding herein dealing with principles applicable to the present motion. I do not find that the defendants/moving parties have shown that it is plain, obvious and beyond doubt that plaintiff could not succeed at trial on these issues.

¶ 32 Accordingly, the motion is dismissed.

COSTS

¶ 33 If the parties are unable to come to terms on costs, I will be available to make a determination by appointment.

DAY J.

R. v. 1267017 Ontario Ltd.

Between
Her Majesty the Queen, and
1267017 Ontario Limited

[2001] O.J. No. 3412

Ontario Court of Justice
Newmarket, Ontario
Lampkin J.

Oral judgment: July 19, 2001.

Charge: Building Code Act

Counsel:

R. Duncan, for the Crown.
N. Gerry, for the accused.

¶ 1 **LAMPKIN J.** (orally):— The Appellant appeals against the dismissal of two counts in which the Respondent was charged with the following offences:

(a) that on or about the 26th day of November, 1998, at 360 Enford Road, being part of Lots 9 and 10 of Plan 4840 in the Town of Richmond Hill, the Respondent constructed or caused to be constructed a building within the Municipality of Richmond Hill without first obtaining a permit therefor issued by the Chief Building Official for the Town of Richmond Hill contrary to s. 8(1) of the Ontario Building Code Act; and
(b) that on or about the 15th day of April, 1999, at the said place, the Respondent failed to comply with Order to Comply #A98-106 issued on the 26th day of November, 1998, by Morris Luchetta, a Building Inspector for the Town of Richmond Hill, contrary to s. 12(2) of the Ontario Building Code Act.

FACTUAL BACKGROUND

¶ 2 The Respondent is a corporation duly incorporated under the laws of the Province of Ontario. On December 1, 1997, the Respondent purchased from Danhart Sheet Metal Contractors Limited the premises municipally known as 360 Enford Road, Richmond Hill.

¶ 3 On November 26, 1998, about 3:15 p.m., Morris Luchetta, then the Senior Building Inspector for the Town of Richmond Hill, in performance of his duties inspected the premises at 360 Enford Road. It appeared to be a one-storey, industrial type building which Mr. Luchetta estimated to have an area of 25,000 to 30,000 square feet.

¶ 4 He found a number of areas under construction. There were about 20 or 30 offices that had been constructed in the interior of the building. The offices were complete save and except that they were not painted. Mr. Luchetta could not say when the construction had been completed and did not know whether it had been completed before December 1, 1997. A permit is not required to paint offices.

¶ 5 There were two other offices or recording studios that had red lights on the outside. The studwork had all been erected, drywall was installed, some of it was taped and some was not. There were exposed members of framing above the ceiling which had not yet been installed. He believed it to be new construction because the material appeared to be new. There were unopened bags of insulation, some of the wallboard had been taped and some not; some had been sanded and some not. There was dust everywhere throughout the two offices or studios.

¶ 6 Upon further inspection, Mr. Luchetta found 20 or 30 motor vehicles, including motor homes, parked in the rear of the building which he considered to be a storage area or warehouse. He said the premises were occupied on November 26, 1998. But apart from a couple of people in the storage area whom he believed to be painting, he saw no others in the building.

¶ 7 At about 5:56 p.m., Mr. Luchetta returned to the premises with Order to Comply No. A98-106 addressed to the Respondent at 360 Enford Road. The Order was served by taping a copy thereof to the front door of the premises and by registered mail addressed to the Respondent at the said address.

¶ 8 The Order stated that an inspection of the building had disclosed a contravention of the Building Code Act. It ordered the owner to correct the contravention forthwith. The Building Code Reference was stated as s. 8(1) of the Act. The nature and location of the contravention were stated as follows:

> "Construction has proceeded at the above premises prior to obtaining a Building Permit. Specifically:Internal Partitions, Offices and storage of motor vehicles".

In the Remarks column of the Order adjacent to the column setting out the nature and location of the Contravention, the following direction is stated:

> "Stop Work until a Building permit is issued".

¶ 9 Mr. Luchetta testified that as of the 15th day of April, 1999 no application for a Building Permit had been made and as a result, the present proceedings were launched. Indeed, as of the date of his testimony, January 10, 2001, the owner had made no application for a Building Permit.

¶ 10 Although he has driven by the premises on a number of occasions, Mr. Luchetta has never made a subsequent inspection inside of the building.

RELEVANT LEGISLATION

¶ 11 S. 1(1) of the Building Code Act defines "building", inter alia, as "a structure occupying an area greater than ten square metres consisting of a wall, roof and floor or any of them or a structural system serving the function thereof ....,

The term "construct", inter alia, means to do anything in the erection, installation, extension or material alteration or repair of a building ....",

> S. 8(1) of the Act enacts as follows:
> "No person shall construct or demolish a building or cause a building to be constructed or demolished unless a permit has been issued therefor by the chief building official."

GROUNDS OF APPEAL

The Appellant appeals on the following grounds:

(a) That the learned Justice of the Peace erred in law in placing the onus on the prosecution of proving a specific time of construction.
(b) That the learned Justice of the Peace erred in fact in determining that a second site inspection was necessary to determine compliance with the Order to Comply.

¶ 12 The learned Justice of the Peace stated in her judgment:

> "The officer gave evidence of what he observed in the building on the 26th day of November, 1998. The counsel for the defence is conceding that construction had occurred on the premises so this is not in dispute. The issue before the Court is when did construction occur?
> On the evidence that is before the Court there are different inferences that can be drawn. One was that construction was occurring or had occurred recently or the inference also can be drawn that the building was purchased by the actual owner, the defendant in this case, on the 1st of December, 1997 and at that time, the time of inspection, the building was in the exact same state as it was when it was purchased."
> She stated further:
> "The inspector who conducted the inspection in this case indicated that he did not inspect that building prior to this single inspection in November but he was aware that a permit had been taken sometime in 1984 or '86 but there was no previous inspection to the date we are talking about here on the 26th of November or prior to that so the officer was not able to give evidence whether there was construction that had occurred prior to that - prior to the purchase of the building ....
> There was a comment that is made by the officer when he gave his evidence that there was dust everywhere. Now does this mean that it was dust that had been accumulated in the area because that area was not used and had not been used for a period of time?"

¶ 13 The learned Justice of the Peace was not satisfied that there was enough evidence to make a decision beyond a reasonable doubt and dismissed the first count.

¶ 14 Counsel for the Appellant submits that the Respondent was at the material time the owner of the building and as such is primarily responsible for obtaining a Building Permit with respect to any construction on the premises. He contends that it is irrelevant whether the Respondent purchased the building in that condition. Once the authorities become aware that there is construction without a Building Permit, they are required to order the present owners to obtain a Building Permit without proceeding further. He submits that the prosecution does not have to prove the specific time of construction. He submits further that the approach of the Respondent in doing nothing is in effect a collateral attack on the validity of the Order to Comply, and since the Building Code Act sets up a mechanism for settling disputes, the Respondent is barred from attacking the validity of the Order. He relies on R. v. Consolidated Maybrun Mines Ltd. (1998) 123 C.C.C. (3d) 449.

¶ 15 Counsel for the Respondent submits that there is no evidence that the Respondent who became the owner of the premises on December 1, 1997, did not purchase the building in the condition in which it was when inspected on November 26, 1998, a few days short of a year after its purchase. He submits that the prosecution must show that there was construction between the date of purchase and the date of inspection so that at least an inference may be drawn that the Respondent "constructed or caused to be constructed" the building and that the prosecution has failed to do that. He concedes that the Order to Comply is valid and submits that Maybrun is irrelevant in the circumstances.

¶ 16 The purpose of the Building Code Act is the protection of the general public from unsafe design and construction. In the 1997 edition of the user's guide of the Ontario Building Code at p. 1 the following is stated:

> "The Code is essentially a set of minimum provisions respecting the safety of buildings with reference to public health, fire protection and structural sufficiency. It is not intended to be a textbook on building design, advice on which should be sought from professional sources. Its primary purpose is the promotion of public safety through the application of appropriate uniform building standards."

¶ 17 In Greater Toronto Airports Authority v. City of Mississauga, (1999), 43 O.R. (3d) 9, Mr. Justice MacPherson encapsulated the powers of municipalities under the Building Code Act. At p. 21 he had this to say:

> "The Act provides municipalities with extensive powers to regulate property development, such as by specifying rules for the construction, demolition, use and occupation of buildings and requiring the submission of plans to a municipal building department for approval before construction may proceed. The Act provides municipal building officials with the power to remove buildings from land and to have them demolished. Those officials are also empowered to make assessments of the structural adequacy of buildings for the purpose for which they are to be used, and they have broad powers to enter and search property and to make orders against both owners of buildings and many other persons who have dealings with buildings thus affecting the property rights of anyone with an interest in the property. The Act also provides for a number of liens which may be visited on the land itself. In short, the subject matter of the Act is buildings and the land on which they are placed."

¶ 18 In the performance of his duties, a municipal building inspector may enter upon land and buildings at any reasonable time without notice and without warrant to ensure that the construction is proceeding according to plan. He may order compliance with the Act or order that construction cease. Where an Order of the inspector is not complied with, the chief building official may prohibit the use or occupancy of the building and may cause the building to be renovated, repaired or demolished to remove the unsafe condition for the protection of the public.

¶ 19 The owner is primarily responsible for applying for a Building Permit prior to the commencement of any construction on his lands. But an application for a Building Permit is not restricted to the owner. A long-term lessee may also apply for a permit. So too may a purchaser under an agreement of purchase and sale: Harju v. City of Thunder Bay (1976), 8 O.R. (2d) 633. There is even provision for the transfer of permits when land changes ownership: s. 7(h).

¶ 20 Having regard to the purpose of the Act, if a purchaser purchases a building in which there is ongoing construction, he may complete the construction in accordance with the permit previously granted to the vendor. But if there was no permit ever granted to the vendor, the purchaser is not entitled to sit idly by and not apply for a Building Permit when served with an Order to obtain one.

¶ 21 And that is the position in which the Respondent finds itself. Notwithstanding the evidence that the construction appeared to be recent, which I would construe to be within the past year of inspection without actually seeking to define the term "recent", if the building was purchased in its present condition, once the Order to Comply had been served, the Respondent had to make the necessary arrangements to obtain the Building Permit. If it sought to dispute the authority of the Building Inspector to issue the Order, then the provision for settling disputes in the Act must be employed. Failing that, he is deemed to have constructed the building without a building permit.

¶ 22 In the circumstances, the appeal with regard to the first count will be allowed and a finding of guilt made.

¶ 23 With respect to the second count, the evidence is that the interior of the premises was not inspected after November 26, 1998. The learned Justice of the Peace said:

> "I do agree that a subsequent inspection would have provided the Court with further evidence but it is not before the Court. So based on that I am not satisfied beyond a reasonable doubt on this charge either and it is also dismissed."

¶ 24 This count appears to be another way of forcing the Respondent to apply for a Building Permit because as of April 15, 1999, no application for a Building Permit had been made in accordance with the Order to Comply issued on November 26, 1998.

¶ 25 S. 12(2) of the Act is the governing section and that enacts as follows:

> "An inspector who finds a contravention of this Act or the building code may make an order directing compliance with this Act or the building code and may require the order to be carried out immediately or within such time as is specified in the order."

¶ 26 Order to Comply No. A98-106 has in its Remarks column the following directive: "Stop Work until a Building Permit is issued".

¶ 27 I agree with the learned Justice of the Peace and the submission of Counsel for the Respondent that absent a second inspection to see whether the Order to Comply had been disobeyed and work had been carried on, there is no evidence on which to register a finding of guilt on this count.

¶ 28 In Working Paper No. 29 issued by the Law Reform Commission of Canada in 1982 on Criminal Law: The General part - Liability And Defences, the following comment is made at p. 81 under the heading "Reliance on Authority":

> "A special problem arises regarding areas of law, like tax laws, laws on weights and measures, etc., which are basically non-criminal law but which create offences. Such laws are regularly explained to citizens by those responsible for the administration of those laws. The commonest guide, then, to the scope and meaning of such laws becomes official pronouncements, rulings and directives. So, where reliance in good faith is placed on such authority, it clearly is unfair to penalize the citizen for failing to predict eventual court interpretation."

¶ 29 I consider the Building Code Act to be a statute on which citizens may need explanation by those responsible for its administration.

¶ 30 The Working Paper certainly does not have the force or authority of statute law or of a judgment. But it is interesting to see the names of the Commissioners who carefully considered the paper in its entirety. Among those who did so were Mr. Justice Antonio Lamer, as he then was, who went on to become Chief Justice of Canada, and Mr. Justice Gerard V. La Forest, who was also subsequently appointed to the Supreme Court of Canada.

¶ 31 When one reads the directive in the Remarks Column of the Order to Comply, it is reasonable to come to the conclusion that there would be no breach of the Act if the work is stopped and not continued. The Act provides far more drastic measures to deal with the Respondent if it continues to be recalcitrant than to register a finding of guilt on the second count.

¶ 32 In the circumstances, the appeal on this count is dismissed.

LAMPKIN J.

Thomas Furniture Ltd. v. Toronto

(City) Chief Building Official

Between
Thomas Furniture Limited and Ocean Hiro Ltd., applicants, and Ann Borooah, in her capacity as Chief Building Official of the City of Toronto, the Corporation of the City of Toronto, and Dixon Hall, respondents

[2002] O.J. No. 929
Court File No. 01-CV-222738

Ontario Superior Court of Justice
Motions Court
Jennings J.

Heard: February 25, 2002.
Oral judgment: February 25, 2002.
Released: March 6, 2002.

Counsel:

Patricia Foran, for the applicant.
Thomas H. Wall, for the respondents, Ann Borooah, in her capacity as Chief Building Official of the City of Toronto and the City of Toronto.
Linda Shin, for the respondent, Dixon Hall.

¶ 1 **JENNINGS J.** (orally):— The issue is whether the proposed facility at 2714 Danforth Avenue, Toronto, is a "crisis care facility" or a "hostel".

¶ 2 If it is a crisis care facility, a building permit is not obtainable because another crisis care facility or residential care facility is operating within 245 metres of 2714 Danforth Avenue (see By-law 438-86, s. 8(2)3(ii).

¶ 3 A crisis care facility is defined in the By-law as:

> "Crisis care facility":
>
> "means a temporary residence for persons requiring immediate shelter and assistance for a short period, and:
>
> (i) the facility is supervised, or the members of the group are referred, by a hospital, court or government agency; or
> (ii) the facility is funded wholly or in part by a government, other than funding provided solely for capital purposes; or
> (iii) the facility is regulated or supervised under a general or special Act;
>
> but does not include a use otherwise classified or defined in this by-law".
>
> (emphasis added)

¶ 4 A hostel is defined as "a building or part of a building that contains dwelling accommodation consisting of rooms without culinary facilities, but does not include a rooming house or a crisis care facility".

¶ 5 The evidence is that the facility is intended to provide temporary shelter for homeless individuals.

¶ 6 It is not disputed that the facility is funded by a government so that the necessity of meeting one of the three enumerated requirements is satisfied.

¶ 7 The respondents submit that the users of the facility are not necessarily persons requiring "immediate ... assistance for a short period" in addition to requiring immediate shelter. Additionally, they submit, the assistance, must relate to the particular crisis being experienced. Alternatively, they submit that the assistance to be offered is accessory to the sheltering and is therefore permissible as an accessory use.

¶ 8 The proposed assistance includes housing searches, crisis intervention, employment counselling and harm reduction counselling for substance abuse.

¶ 9 I am unable to read in a requirement to relate the need for immediate assistance to a particular crisis such as abuse or addiction as the respondents submitted. Regardless, in my opinion, being homeless is a crisis in itself. The criteria are that a person requires immediate shelter and assistance. The proposed facility will meet those criteria by providing

temporarily immediate shelter and assistance in the form of food and the services enumerated in paragraph 35 of the applicant's factum.

¶ 10 That appears to me to fit the preamble to the definition section. Because of the language used in the definition I do not believe I need to determine if the assistance is an accessory use.

¶ 11 As the facility is a "crisis care facility" as defined, it cannot be a hostel. The Chief Building Officer acted incorrectly in issuing a permit. The applicant is entitled to a declaration and order as asked in paragraphs 1(a)(b) and (c) of the application.

¶ 12 Costs to the applicant against the City fixed at $4,000.00. Although Dixon Hall strongly supported the City's position, this is not a case where costs should be assessed against it.

JENNINGS J.

Welwood v. Huron-Kinloss (Township)

Chief Building Official

Between
John Welwood, John Power and Pauline Watson, applicants, and
Matthew Farrell, Chief Building Official of the Corporation of
the Township of Huron-Kinloss, The Corporation of the Township
of Huron-Kinloss, Gys Geene, respondents

[2002] O.J. No. 1131
Court File No. 31433

Ontario Superior Court of Justice
Browne J.

Heard: January 28-31, February 1 and 4-5, 2002.
Judgment: March 26, 2002.

Counsel:

Valerie M'Garry, for the applicants.
D. Hawreliak, for the defendants, Matthew Farrell (CBO), The Corporation of the Township of Huron-Kinloss (The Township).
Jim Mays, for the defendant, Gys Geene.

¶ 1 **BROWNE J.**:— In this application the relief sought is an order quashing a building permit issued May 10, 2001 with particular reliance upon ss. 25 and 8 of the Building Code Act, R.S.O. 1992, c. 23 (BCA). Matthew Farrell (CBO) as Chief Building Official of the Township of Huron-Kinloss (The Township) issued the building permit which was for two barns to house 4,000 hogs from which operation there would be generated annually some 1.75 million gallons of liquid hog manure to be spread in the township and in the adjoining township Ashfield-Colborne-Wawanosh (Ashfield). In an overview, the competing interests are that ratepayers generally do not want an intensive livestock operation in their own back yard but the reality is that intensive livestock operations are existing viable agri business.

¶ 2 On January 28 there were three preliminary matters addressed involving a motion by Pauline Watson to be added as an applicant, a motion by a non-profit non-share capital corporation to be added as a party applicant and the issue as to whether any of the applicants, existing or proposed, had standing. In the result, I gave oral reasons adding Pauline Watson as an applicant, subject to certain terms. The motion to add the corporation as an applicant was dismissed. I found that the three applicants remaining had standing and the matter proceeded on the merits. Oral reasons were given for the results noted. Should any party request a copy of those reasons, I shall treat the oral reasons as draft reasons subject to reasonable changes without violence to the result.

¶ 3 I have referred above to ss. 8 and 25 Building Code Act. Those sections and s. 9 are as follows:

> 8.(1) No person shall construct or demolish a building or cause a building to be constructed or demolished unless a permit has been issued therefor by the chief building official. 1992, c. 23, s. 8(1): 1997, c. 30, Sched. B, s. 7(1).
>
> Issue of permits
>
> (2) The chief building official shall issue a permit under subsection (1) unless,
>
> The proposed building, construction or demolition will contravene this Act or the building code or any other applicable law; ... (emphasis added)
>
> Equivalents
>
> 9.(1) The chief building official may, subject to such conditions as may be set out in the building code, allow the use of materials, systems and building designs that are not authorized in the building code if, in his or her opinion, the proposed materials, systems and building designs will provide the level of performance requested by the building code. 1992, c. 23, s. 9.
>
> Appeal
>
> 25.(1) Any person who considers themselves aggrieved by an order or decision made by an inspector or chief building official under this Act or the regulations, except a decision not to issue a conditional permit under subsection 8(3), may, within twenty days after the order

or decision is made, appeal the order or decision to a judge of the Ontario Court (General Division). 1992, c. 23, s. 25(1).

Extension of time
A judge to whom an appeal is made may, upon such conditions as the judge considers appropriate, extend the time for making the appeal before or after the time set out in subsection (1), if the judge is satisfied that there is reasonable grounds for the appeal and for applying for the extension. 1992, c. 23, s. 25(2).
Effect of appeal
If an appeal is made under this section in respect of a matter in which a question is pending before the Building Code Commission, the proceeding before the Commission is terminated. 1992, c. 23, s. 25(3).
Powers of judge
If an appeal is made under this section, the judge shall hold a hearing and may rescind or affirm the order or decision of the inspector or chief building official or take such action as the judge considers the inspector or chief building official ought to take in accordance with this Act an the regulations and, for such purpose, may substitute his or her opinion for that of the inspector or chief building official. 1992, c. 23, s. 25(4).

¶ 4 Regulations under the Building Code Act are generally described as the Building Code and certain sections having relevance will be touched upon subsequently in these reasons.

ISSUE: WAS A MEETING HELD MARCH 27, 2001 A TOWNSHIP COUNCIL MEETING?

¶ 5 I will deal subsequently with minutes relating to this particular meeting. I am told there is other related litigation and there may be that in that litigation an issue as to whether or not the particular meeting of March 27, 2001 was a full-fledged or legal council meeting. For the purposes of these reasons, the legality of the meeting is not an issue and I do not intend any of these reasons to be determinative of the issue identified.

ISSUE:STANDARD OF REVIEW

¶ 6 There is no real issue joined as to what is the applicable standard of review. Issues are raised as to how the standard is to be applied. In a short form approach, the standard not in issue is as follows: 1) On questions of law, the CBO is required to be correct, 2) On questions of fact the CBO is required to meet a standard of reasonableness, and 3) On mixed questions of law and fact, the CBO is required to meet a standard of reasonableness. The standard of correctness would also apply to jurisdiction but jurisdiction issues are not raised in this case. Cases of assistance on the standard of review include the following: Canada (Director of Investigations and Research) v. Southam Inc., [1997] 1 S.C.R. 748, Burns v. Perth South (Township) Chief Building Official (2001), 54 O.R. (3d) 266 and Lock v. Middlesex Centre (Township) Chief Building Official (2001), 22 M.P.L.R. (3d) 66 (Ont. S.C.J.).

¶ 7 From para. 16 of the decision of Madam Justice Leitch in Lock there is the following:

> With respect to the standard of review of the decision of a chief building official, I think it is necessary to refer only to the decision of Malloy J. in Runnymede Development Corp. v. 1201262 Ontario Inc. (2000), 47 O.R. (3d) 374 (Ont. S.C.J.) and her conclusion that a standard of correctness will generally be applied to decisions based on law or jurisdiction and a standard of reasonableness will be applied to questions of fact. With respect to questions of mixed fact and law, the more the decision of the chief building official is a determination of law, the closer the standard will be to correctness whereas if the decision is dependent upon factual determinations within the special expertise of the chief building official the more deferential will be the standard.

¶ 8 Justice Killeen canvasses thoroughly the issue of standard of review in Burns from paras. 34 to 40 inclusive. Justice Killeen's review is complete, instructive and persuasive. I agree with his comments and conclusions.

ISSUE: IS THE ENVIRONMENTAL PROTECTION ACT, R.S.O. 1990, c. E.19 APPLICABLE LAW WITHIN THE BCA FOR THE PURPOSE OF THIS CASE.

¶ 9 The parties are in agreement that this is a question of law and the standard is one of correctness. The CBO determined that the Environmental Protection Act was not applicable law. I reproduce from the statute the following sections:

6.(1) No person shall discharge into the natural environment any contaminant, and no person responsible for a source of contaminant shall permit the discharge into the natural environment of any contaminant from the source of contaminant, in an amount, concentration or level in excess of that prescribed by the regulations.

Exception
Subsection (1) does not apply to animal wastes disposed of in accordance with normal farming practices. R.S.O. 1990, c. E.19, s. 6.

9.(1) No person shall, except under and in accordance with a certificate of approval issued by the Director,

construct, alter, extend or replace any plant, structure, equipment, apparatus, mechanism or thing that may discharge or from which may be discharged a contaminant into any part of the natural environment other than water; or ... (emphasis added)
Prohibition

14.(1) Despite any other provision of this Act or the regulations, no person shall discharge a contaminant or cause or permit the discharge of a contaminant into the natural environment that causes or is likely to cause an adverse effect. (emphasis added)

Exception
Subsection (1) does not apply, in respect of an adverse effect referred to in clause (a) of the definition of "adverse effect" in subsection 1(1), to animal wastes disposed of in accordance with normal farming practices. R.S.O. 1990, c. E.19, s. 14.
Definitions

(1) In this Act, "adverse effect" means one or more of,

impairment of the quality of the natural environment for any use that can be made of it,
injury or damage to property or to plant or animal life,
harm or material discomfort to any person
an adverse effect on the health of any person,
impairment of the safety of any person,
rendering any property or plant or animal life unfit for human use,
loss of enjoyment of normal use of property, and
interference with the normal conduct of business;
("conséquence préjudiciable").

¶ 10 In Burns supra, Justice Killeen had this issue squarely before him. His conclusion is found at para. 92 in the following words:

[92] Orders will issue as follows:

It is ordered and declared that s. 14 of the Environmental Protection Act is not other applicable law within the meaning of s. 8 of the Building Code Act.

(3) It is ordered that the applicant may not tender expert evidence directed to issues under s. 14 of the EPA.

¶ 11 There were other issues before Justice Killeen but he addressed directly the question of whether a future spreading of manure would be a contravention of s. 14 as being a contravention of "other applicable law". The issue in the present case (as well as in Burns) is not whether the Environmental Protection Act is other applicable law within s. 8 of the Building Code Act for all purposes, but whether it is other applicable law pertaining to the building permits in issue in each case which both involve hog barns for intensive agri use. The building permit at issue in Burns was also for two hog barns.

¶ 12 In para. 45, Justice Killeen, having set out s. 6, comments as follows.

As can be seen from s. 6, its s. 6(1) starts with a majestic injunction prohibiting anyone from discharging any contaminate into the natural environment. Subsection 6(2), however, provides a complete exemption from s. 6(1) by saying that it does not apply to "animal wastes" - i.e., including liquid manure - disposed of in conformity with normal farming practices.

¶ 13 And further, in para. 48 having set out s. 9(1) the comments continue as follows:

> Subsection 9(3), however, contains a series of six specified exemptions to the generality of the apparent scope of s. 9(1), including the exemption in para. 9(3)(e) which says that subsection 9(1) does not apply to "any plant, structure, equipment, apparatus, mechanism or thing used in agriculture; (emphasis added)".

And from para. 50:

> The importance of the exempting provisions of ss. 6 and 9 of (the) EPA is that they demonstrate that while some provisions in the EPA may catch a proposed construction project or other activity under the "other applicable law" criterion, some projects - and certainly agricultural building projects such as that proposed by Cold Springs - cannot be stopped under either of these sections because of an unambiguous statutory exemption granted by the legislation for agricultural operations."

¶ 14 The decision in re: Burns does not stand in support of an argument that s. 14, cannot be applicable law within s. 8 CBA but that in that case it was not applicable law for the construction of the hog barns in issue.

¶ 15 In a case comment found in a publication dealing with the Environmental Protection Act, the editor criticizes Justice Killeen's decision taking the narrow position that from a plain reading of s. 14(2) that subsection does not apply with respect to an adverse effect as defined other than in para. (a) of the definition of adverse effect. Justice Killeen canvassed, as I have indicated, s. 6(9). He considered the Environmental Protection Act as a whole and the balancing of the interest addressed in that legislation with the farm practices mandate in the Farming and Food Production Protection Act, S.O. 1998, C. 1. In reaching his conclusion, he read the two pieces of legislation as balancing competing interests. I adopt his conclusion that the Environmental Protection Act is not applicable law as it relates to the building permit for the two hog barns, the subject of this application. It follows that the CBO has satisfied the standard of correctness on the EPA issue.

AGREED APPLICABLE LAW WITHIN S. 8 BCA

¶ 16 The parties are in agreement that certain law is applicable law within s. 8 of the Building Code Act for the purposes of this application. Without attempting to be all inclusive, these include the Building Code Act, the Manure Pit By-law and the Nutrient Management By-law. The two by-laws have much in common. Each has a definition for intensive agricultural use. It is agreed that the intended use is within the definition. Each By-law has a provision in the same wording relating to application of other requirements. In the Manure Pits By-law, the section is s. 5.1. In the Nutrient Management By-law the section is 7.1. The wording is as follows:

> Nothing in this By-law shall operate to relieve any person from the obligation to comply with the requirements of the Ontario Building Code Act, R.S.O. 1992, the Township's Zoning By-laws or any other By-law of the municipality in force from time to time or the obligation to obtain any other licence, permit, authority or approval lawfully required by a governmental authority having jurisdiction to make such restrictions.

¶ 17 Each by-law has a similar definition of a site plan. The following is taken from the Nutrient Management By-law:

> Site plan shall mean a scale drawing showing the relationship between a livestock facility and/or manure pit and neighbouring land uses including areas designated or zoned in a non-agricultural category; non-conforming uses; neighbour's, residences; middle-of-the-road allowances and lot lines.

¶ 18 From the Manure Pit By-law, an application for a permit is required. The application is to include a plan, including the following:

> 4.4.1. Dimensions of the lot to be built upon or otherwise used;
> 4.4.2. The proposed type, location and dimensions of the manure storage facility proposed for such lot and its distance relative to:
>
> 4.4.2.1. the lot lines;
> 4.4.2.2. the adjacent public road;
>
> 4.4.2.3. the nearest drilled, dug or communal well

4.4.2.4. the nearest watercourse, pond, drainage ditch, lake, river, stream or water body, including intermittent flows;
4.4.2.5. the location of the nearest field drainage tile;
4.4.2.6. the location of any area designated or zoned residential, recreational or institutional and has a location which falls within the Provincial and Municipal Minimum Distance Separation II (MDS II) formula. (emphasis added)

¶ 19 Section 4.4.4 of the Manure Pit By-law also incorporates application of the MDS II formula. And from s. 6.2 under the heading Minimum Separation Distances is the following:

Covered concrete, liquid livestock manure pits shall be located in accordance with the Provincial and Municipal Minimum Distance Separation II (MDS II) formula. (emphasis added)

¶ 20 The two hog barns, the subject of the building permit issued, have the manure pit facilities underneath the hog barns with the hogs being upon slats, the manure pit being directly underneath the hogs.

¶ 21 The construction standards are referred to in s. 6 of the Manure Pit By-law as follows:

6.1.1. Be designed and constructed in accordance with the provisions of the Ontario Building Code with specific reference to CAN/CSA A23.3-M84 "Design of Concrete Structures for Buildings".

¶ 22 The Nutrient Management By-law applies to intensive livestock operations. From s. 4 is the following:

A Nutrient Management Plan shall be completed prior to the issuance of a building permit. The Ontario Ministry of Agricultural, Food and Rural Affairs shall review and approve all Nutrient Management Plans prior to submission to the Municipality. (emphasis added)

¶ 23 This by-law also requires that for an application for a permit, a plan be filed including:

5.5.1. Dimensions of the lot to be built upon or otherwise used:
5.5.2. The proposed type, location, and dimensions of the manure storage facility proposed for such lot and its distance relative to:

5.5.2.2. the adjacent public road;

5.5.2.3. the nearest drilled, dug or communal well;

5.5.2.5. the nearest watercourse, pond, drainage ditch, lake, river, stream or water body, including intermittent flows;
5.5.2.5.(sic) the location of the nearest field drainage tile;
5.5.2.6. the location of any area designated or zoned residential, recreational or institutional and has a location which falls within the Provincial and Municipal Minimum Distance Separation II (MDS II) formula.

¶ 24 By itself, the Minimum Distance Separation II (MDS II) is a policy for a calculated distance. It is agreed that the policy document at least insofar as the formula is concerned is incorporated within the by-laws mentioned. It is of assistance to set out the statement of Background for MDS II.

A principle of land use planning is the grouping together of compatible land uses and the separating of incompatible land uses. Industrial parks, residential subdivisions and commercial areas as separate parts of an urban area are a reflection of this principle.
The agricultural community generally acknowledges that even with the best management, noise and dust cannot be eliminated from certain agricultural operations and that odours are associated with livestock production. Not all rural residents, including some farmers, can accept these conditions particularly when the nuisance is perceived to exceed acceptable levels.
In rural areas, this principle of separating different and incompatible land uses has not always been applied. Where there has been sufficient separation distance between differing rural uses, however, there have been few complaints. The distance separation will vary with the source of the potential

complaint and the sensitivity of the neighbouring land use. The primary purpose and use of prime agricultural areas should be for agriculture. Non-farm residents who seek the advantages of country life must be aware of the noise, odour and dust associated with normal farm practices. (emphasis added) Should complaints about odours, noise or dust occur, the Ministry of the Environment and Energy will respond. If the complaint is valid, Ministry of the Environment and Energy staff in cooperation with the farm operator and in consultation with Ministry of Agriculture, Food and Rural Affairs staff recommend measures to resolve the complaint. If the complainant still has concerns they may request a hearing by the Farm Practices Protection Board. This Board can only hold hearings in regard to odour, dust or noise concerns. The Board rules whether the occurrence is a normal farming practice. The Minimum Distance Separation (MDS) is a tool to determine a recommended distance between a livestock facility and another land use. The objective is to prevent land use conflicts and minimize nuisance complaints from odour. MDS does not account for noise and dust (emphasis added). Minimum Distance Separation will vary according to a number of variables including type of livestock, size of the farm operation, type of manure system and the form of development present or proposed. ... MDS II provides minimum distance separation for new or expanding livestock facilities from existing or approved development. ... Ultimately, land use planning decisions (including MDS) and good farm practices must go hand-in-hand to promote harmony in the rural community and to ensure agriculture as an ongoing activity.

¶ 25 From the Implementation Guidelines there are the following:

MDS formulae and criteria are to be referenced in official plans and included in by-laws and are to be applied in designations and zones where livestock facilities are a permitted use and is to be implemented at the time of planning and/or development review. MDS II applies when an application is made for a new, existing, modified or expanding livestock facility. The application may be for a building permit or an application under the Ontario Certificate of Compliance Program. ... Minor variances to the MDS II distances can be considered based on site specific circumstances. Municipal officials must consult with Ontario Ministry of Agriculture, Food & Rural Affairs staff when considering a variance application. Conditions that meet the intent, if not the precise distance of MDS II or mitigate environmental impacts, will receive further consideration. (emphasis added) Distances to Residential Subdivisions, Urban Areas, areas zoned or designated Agriculturally Related Commercial Use, Passive Recreational, Institutional, Active Recreational or Commercial/Industrial are measured as the shortest distance between the barn or manure storage and the land uses noted above. ... All distances are measured from the closest point of the barn used for animal housing. DEFINITIONS:

Residential Area:

Areas zoned or designated residential. (emphasis added)

Urban Area:

Cities, towns, villages, and hamlets for such uses as residential, recreational, institutional, commercial and industrial.

¶ 26 The Data Sheet contains the following statement of purpose:

To permit the orderly development of livestock operations within agricultural areas, and to reduce the potential for environmental conflicts between livestock or poultry operations and incompatible land uses.

¶ 27 In the checklist for sketch preparations there is the following:

Location and distances in metres from subject structures to nearest area zoned "Residential".

¶ 28 The Minimum Distance Separation II Calculation Form uses the following table to calculate that distance which is required in addition to that distance actually measured.

> Areas zoned or
> designated Residential,
> Institutional,
> Active Recreational, or
> Commercial.
> Urban Areas

¶ 29 The Manure Pit By-law and the Nutrient Management By-law quoted in part were each replaced June 18, 2001. More is required to comply with the new by-laws than that which is required to comply with the by-laws before me.

¶ 30 The Nutrient Management Plan is required to include the MDS II formula calculation. The Nutrient Management Plan is submitted firstly to the ministry and, upon approval by the ministry, to the municipality. Compliance with the by-law can possibly require more than that which is required to obtain provincial approval. As for example, the by-law requires that the plan be prepared by a third party certified agronomist. There is no such requirement for provincial consideration or approval.

RESPONDENTS OTHER THAN IN THE STYLE OF CAUSE

¶ 31 The proceedings initially named only the township as respondent. Mr. Geene is the owner of the farm property in issue. He applied and was added as a respondent. Beechcore Group Limited applied and was added as a respondent. Ashfield applied and was added as a respondent. Before this hearing, the issues involving Beechcore were resolved. During the hearing before me the issues involving Ashfield were resolved. I was told at the outset that resolution involving Ashfield was imminent and by endorsement made February 1 the resolution was recorded. The involvement of Ashfield in these proceedings dealt with a by-law of that municipality.

ASHFIELD BY-LAW NO. 24-2001

¶ 32 The township's CBO used as a resource person, the CBO of Ashfield. Ashfield enacted the following by-law April 3, 2001:

> No person shall use any lands within the municipality for depositing, storage, spreading or other disposal of livestock manure which originates outside of the Municipality and has been brought into the Municipality for that purpose, unless such depositing, storage, spreading or disposal is performed in accordance with a Nutrient Management Plan approved by the Municipality.

¶ 33 The Geenes own property in both townships. The Nutrient Management Plan filed by or on their behalf includes the use of lands they own in Ashfield to spread manure. In the settlement document filed in these proceedings Ashfield recently approved a Nutrient Management Plan as required by the terms of By-law 24-2001.

ISSUE - IS ASHFIELD BY-LAW 24-2001 OTHER APPLICABLE LAW?

¶ 34 The position advanced on behalf of the applicants is that the building permit applied for March 19, 2001 and issued May 10, 2001 results in the applicable law being that law which crystallized at least by May 10, 2001. The further position is that the Ashfield By-law is applicable law and that the municipality of Ashfield was required to approve the Nutrient Management Plan before the township could issue a building permit. The township CBO had actual knowledge of the Ashfield By-law requirements. No inquiries were made by the CBO for the approval referred to in the Ashfield By-law being obtained. It is my view that the Ashfield By-law is not applicable law, that the by-laws of Ashfield speak to Ashfield's own jurisdictional (geographic) area.

¶ 35 The Geenes' Nutrient Management Plan, including the spreading of manure upon their land in Ashfield, received approval from the provincial ministry.

¶ 36 It is clear that applicable law includes more than merely the by-laws of the township or the by-laws of the township incorporating the need for other approvals. The argument is advanced that s. 7.1 of the by-law requires a further approval for compliance with the Ashfield By-law. By use of words in this section to the obtaining of "any other licence, permit, authority or approval lawfully required by a governmental authority having jurisdiction to make such restrictions," the argument is made that Ashfield is such a governmental authority having jurisdiction to make the by-law in issue which requires a permit or authority and that as such the municipality's CBO should have inquired and required such authority or

approval. That argument cannot stand when the section is considered in its totality. The purpose of this section of the by-law is to recognize that compliance with the rest of the particular Nutrient Management By-law does not give relief for an obligation to comply with other requirements from different legislation or governmental authority. By way of a simple example, compliance with the municipality's Nutrient Management By-law does not necessarily mean compliance with the municipality's Manure Pit By-law and, in like manner, compliance with both of the township's by-laws does not amount to relief from compliance with any Ashfield By-law. In the result, the Ashfield By-law is not applicable by-law within s. 8 of the BCA for the purposes of this application.

¶ 37 It may be that a consideration of the actions or lack of action by the CBO, factoring in the context of the Ashfield By-law will go to a consideration of reasonableness of the actions of the BCO. Such a consideration does not elevate, from the consideration of the by-law in that evidentiary way, the by-law to other applicable law.

¶ 38 Insofar as the CBO did not consider the Ashfield By-law as requiring him to satisfy himself that there was approval as required further to the terms of that by-law he was correct in law.

BACKGROUND INFORMATION

¶ 39 As referred to above, the Geenes own lands within two adjoining townships, having purchased the property in 1999. The Geenes have been involved for some time in discussions with the municipality of plans for barn(s) for a hog operation. Prospective proposals have been discussed involving 6,000 and/or 4,000 hogs. There have been further discussions with reference to poultry. Different Nutrient Management Plans have been submitted. At least one such plan was approved but approval was subsequently revoked.

¶ 40 Michael Hunter of CropAdvisory.com is a certified crop advisor. Also associated with that company is Susan Schuster described as a practising agronomist. Michael Hunter furnishes services to the Geenes in an ongoing way. Specifically, he furnished services with reference to the preparation and submission of the applications required for the building permit, including the Nutrient Management Plan preparation and filed with the ministry for approval. The Nutrient Management Plan is signed April 18, 2001 by Michael Hunter and by Susan Schuster, he being designated as a Certified Crop Advisor, she being designated as practicing Agronomist.

¶ 41 I have referred earlier to a meeting March 27, 2001 being a meeting attended by representatives on behalf of the ratepayers, the Geenes and representatives on their behalf and by members of council. Minutes were kept. The minutes included the following:

> Recommendations
> After a brief recess, a list of recommendations was developed for Council's consideration:
>
> > 8.1 Have the building plans reviewed by Township's engineers.
> > 8.2 Have engineering inspector on site during construction.
> > 8.3 Have Mike Hunter's Nutrient Management Plan reviewed by a mutually agreed upon independent consultant.

¶ 42 There were 13 such matters listed with a further heading of items titled "Additional Suggestions Proposed by the Ratepayers". There is no evidence of any subsequent council meeting to consider the list of recommendations. However, and notwithstanding the discretion of the CBO under the BCA and municipal by-laws, the CBO did consult with an engineer and steps went forward in the context of the recommendation for an independent consultant to review the Nutrient Management Plan. Such a review was not required as a matter of law. Such a review was little more than extending a courtesy.

¶ 43 The Nutrient Management Plan dated April 18, 2001 was approved further to the "Review Criteria of the Ontario Ministry of Agriculture, Food and Rural Affairs" May 7, 2002. The plan as approved was delivered by hand by the official signing the approval, Don Hilborn, to the CBO, Matthew Farrell.

¶ 44 On or about May 8, 2001, a communication went forward from the township to the applicants herein that it was the intent to issue a building permit within three days and that a building permit would issue May 10. On or about May 9, the approved Nutrient Management Plan was forwarded by the township to James Weeden who had been identified as the "independent consultant".

¶ 45 The building permit issued May 10, 2001 about 8:30 a.m. Construction started within a half hour thereafter being stayed by court order May 15, 2001.

¶ 46 The CBO prepared at least three MDS II calculations bearing the following dates: August 17, 2000, August 20, 2001 and May 9, 2001. From these dates it follows that the May 9 calculation is after the approval by Mr. Hilborn. In the Nutrient Management Plan is contained a calculation sheet dated August 17, 2000. Whether the use of the year 2000 was correct or in error is not clear. In that part previously referred to for neighbouring land use or boundary, under the required distance is a figure generated by formula to indicate the distance required. The figure is 1,300 metres. That is the same distance for manure storage which follows from the fact that the manure storage is directly under each building. The table also requires measurements for actual distances but no figures are entered into the actual figure column. Notwithstanding that absence, the plan was approved by the province.

¶ 47 The calculation sheet for minimum distance separation prepared by the CBO dated May 9, 2001 shows under the column for required measurements the same figure of 1,300 meters for both the barn building distance and manure storage distance. In the actual figure column under each building distance is the figure 1,424 metres, under the manure storage figure is the figure 1,452 metres. There is no explanation as to why those figures differ when there appears to be two separate single structures comprising the barn building and the manure storage each with one foundation or footprint.

¶ 48 The third calculation sheet being the second in the apparent time chronology is dated April 20, 2001. Again, the required distance measurement is 1,300 metres. Under the building distance for actual distance is 1,452 metres. Under the manure storage the actual distance is 1,452 metres. On this basis there appears to be 152 meters more actual distance than required distance.

¶ 49 Different sketches were presented to the CBO on behalf of the Geenes. All sketches show in relationship to Amberley what is labelled as "designated area".

¶ 50 By way of a Fax cover page dated March 19, 2001, the CBO forwarded to the contractor the following message:

> Can you or Gys fill this out and get it back to me as soon as possible? It is so I can issue the permit before Art stamps the drawings. If you have any questions let me know.

From the above quotations "Gys" is Mr. Geene and "Art" is Mr. Clark, engineer for the proposed building contractor.

¶ 51 From this communication, there appears to be a holding out at that point in time, that a building permit would issue before some requirements were completed.

¶ 52 The fax enclosure appears to have been an agreement for the issuance of a conditional building permit with the conditions being "File plans and specifications of the completed building by March 30, 2001 & plans to be stamped by a Professional Engineer". This appears on its face to relegate plans, specifications and the stamping of the plans by a professional engineer to a procedural checklist having little, if any, application of expertise or discretion. Who would want a conditional building permit for plans to be submitted unless it was certain the plans would be approved and an unconditional permit issued. The CBO appears not to have reserved to himself any room to exercise a real discretion to evaluate material to be received at a future time.

¶ 53 David Smith is the planner for the County of Bruce. The Hamlet of Amberley is an urban area within the county for which Smith has responsibilities. By a faxed transmission March 30, 2001 from Smith to Geene's contractor, two maps are forwarded. The transmittal, copied to the CBO, is as follows:

> Attached are two maps showing the "urban area" of Amberley in relation to the OBM mapping and also overlaid on the assessment map.
>
> > The MDS II calculation should be made from the proposed location of the new barn(s) to this dotted line as per the MDS II implementation guidelines, para. 9 (Measurements).

¶ 54 The two maps are an assessment map and an Ontario Base Map. What is within the "dotted line" is arguably the part of the Hamlet of Amberley that is within the township. There is another portion of the hamlet on the other side of the highway within the adjoining municipality. It is

clear that Smith intended the dotted line to show an area designated by the county's Official Plan. The 1,300 metre measurement encroaches inside of the dotted line.

¶ 55 Whether one uses from the calculations of the CBO dated May 9 the figure of 1,424 or 1,452, it appears the intent is that the measurement be from the intended barn(s) to the closest portion of Amberley zoned residential.

¶ 56 On most of the sketches or maps filed on behalf of Geene, there is illustrated and labelled a "designated area" which is consistent with an area designated by the Official Plan. In a sketch prepared by an Ontario Land Surveyor, relying in part upon materials supplied and in part on field work, is shown a designated area with a measurement of 1,115 metres from the line representing the edge of the area marked "designated area", with a further measurement of 1,424 between the barn and the closest portion of Amberley zoned residential.

¶ 57 The plan forming part of the Official Plan illustrates Amberley. The plan is a large plan for the entire county and, although to scale, it would be extremely difficult to use that map with any kind of precision. From the examination of the CBO it is clear that before he received his copy of the communication from the planner Smith, he regarded, in error, the minimum distance calculation to be based upon the distance arrived at using only zoning lines. It was only when he received the Smith communication that he questioned whether there was more. Expressed differently, it appears that prior to that point in time he had not directed his mind to the words "zoned or designated". My understanding from a consideration of his cross-examination and, in particular, questions 205 to 219, is that he took a new position that he could choose either distance based upon 1) zoning or 2) designation and that he had a discretion to use either distance. My understanding from the response at 219 is that he felt the plans were not useful or pertinent to this application. His words are as follows: "I didn't believe those drawings were useful or pertinent to this application".

MDS II FORMULA

¶ 58 It is agreed that further to the terms of the two municipal by-laws the MDS II formula is applicable law within s. 8 Building Code Act. If that were the only issue, the test would be one of correctness and if the CBO directed his mind to formula calculations, the next question would logically be whether he took a reasonable approach. In my view, the issue is to be expressed differently: As a matter of law was the CBO entitled to choose as an end point for measurement of MDS II distances either a) zoned or b) designated land?

¶ 59 It is agreed that, whatever the accurate measurements may be, the distance from the barns to the zoned lands is greater than the distance from the barns to the designated lands being lands designated further to the Official Plan. It is further agreed or in any event my conclusion that if the measurement for actual distance purposes is to be the measurement from the barns to the designated area, that the actual distance measurement is less than that which is required. Was the CBO entitled in his discretion to use the measurement applicable to zoning rather than the measurement applicable to designation or because of the difficulty in accurately assessing the precise measurement to designated lands to fall back upon the use of the measurement to the zoned lands. Measurement from the barns to the Official Plan designation would result in a measurement less than the required measurement whatever the precise measurement may be to lands designated.

¶ 60 The three main points advanced on behalf of the respondent Geene with reference to MDS II is, firstly, that there need to be two hard points for measurement purposes. Secondly, that the limits of Amberley further to the Official Plan cannot be accurately or precisely surveyed or measured. Thirdly, that a consideration of the principles of the Official Plan or an attempt to strictly apply the Official Plan result in a lack of capability of doing so. It is argued the Official Plan policies are not applicable to the area argued by the applicants to be within Official Plan designated area for measurement purposes.

¶ 61 An expert planner was called in support of these positions. Her evidence seems to raise four points as can be seen by her answer to Question 279. The question is in the context of a consideration of para. 9 of the MDS II guideline where, under the heading "Measurement", the following is found:

> Distances to Residential Subdivisions, Urban Areas, areas zoned or designated Agriculturally Related Commercial Use, Passive Recreational, Institutional, Active Recreational or Commercial/Industrial are measured as the shortest distance between the barn or manure storage and the land uses noted above.

> Question 279. ... The whole issue from your perspective turns on the fact that it's a fuzzy line? Is that what it turns on? Answer: It turns on two dimensions. 1, that it is a fuzzy line as you say. And 2, that it is an undeveloped fuzzy area. And that 3, it is owned by and an integral part of the operation that is at question. And that to interpret the Official Plan or therefore to interpret MDS to require a setback from it is not appropriate and is not representative of how one utilizes Official Plan and Official Plan designations for the purpose of development or non-development.

¶ 62 Breaking the answer down into four parts, the first two seem to be related in the context of fuzzy line and/or fuzzy undeveloped area. The third and fourth points appear to be related to land ownership and utilization of land within the intended specific agricultural use. This case involves the spreading of manure and/or the location of hog barns. The land found to be within the designated area on the sketches may be fuzzy in the sense of being difficult to measure. The lands within the required MDS formula distance, even if used for manure spreading, does not by itself have anything to do with the location of the barns. The use of the lands was not fuzzy. The location of the line for designation purposes may be fuzzy but in a narrow sense that has little to do with actual or proposed use. The use of this part of the land contemplates manure spreading and not barn locations. The spreading of manure involves a Nutrient Management Plan which is separate from the location of buildings addressed by the MDS formula. The lands argued by the applicants to be within the designated area include mainly lands of the Geenes' but some other lands are also included. To suggest that certain of the lands have recognition under the Official Plan and certain do not because they are owned by the applicant is, in my view, illogical. The evidence of the expert was that the distance from the barns to the designated area could not be precisely made. It appears to follow that her evidence (argument) was that the designated area could be ignored. I do not agree.

¶ 63 It is agreed that there is ample authority that the provisions of an Official Plan are not other applicable law within s. 8. It is agreed that for the purposes of consideration of the application of the MSD II formula that reference can be to the Official Plan and indeed reference was made by the CBO to the Official Plan and no party takes issue with that. If the measurement to lands designated in the Official Plan, even if it is not capable of precise or accurate measurement, is ignored, there is a well-founded argument which I accept that the policies of the Official Plan would be frustrated in the future. Equally frustrated would be the background policy purposes for MDS II formula, as the balance between residential land use planning or planning of an urban area which would be frustrated by the proximity of barns for intensive agricultural use without the intended separation buffer. The buffer is designed, even if imperfectly, to balance legitimate interests. Where the distance to designated lands is less than the distance to zoned lands and where the measurement ignores designated lands in favour of zoned lands that is contrary to the spirit of the policies I have identified and is, in my view, not correct in law.

¶ 64 In my view, there may be fact situations where there may be zoned land without designated land in which case the appropriate measurement would be to the zoned land. It may be that zoned land and designated land will have the same distance measurements. It may be, as in this case, that the distance for designated land and zoned land will differ. As a matter of the correct application of law, it is my conclusion that the measurement to be utilized is that which is most coincidental with the policy. In this case that would be the measurement from the barn to the designated area subject to a variance as contemplated by the guidelines. I do not attempt to quantify that measurement. This has been an issue that was well identified in advance of the application for the building permit. My comments to counsel included: given that this issue was identified early on, why was the location of the barns not relocated at a further distance from Amberley so as to make the question of the proper MDS distance a non-issue. There is nothing in the evidence to suggest that could not have been done. There is nothing to which I am referred that suggests a variance was ever considered as contemplated in the guidelines such a consideration might have resolved the difficulty of precise measurement.

¶ 65 If I am wrong that this issue is to be determined by a standard of correctness, then it is to be determined by a standard of reasonableness. On all of the evidence before me, not just the fax communication quoted, there is an inference that the CBO was prepared to issue the permit in any event. Prior to this particular application he had never directed his mind to lands designated as opposed to lands zoned. Even though he considered the terms of the Official Plan (the policies not just the actual map or plan), he determined that he, in his discretion, could make an either/or decision. I conclude on the facts as in this case he was wrong as a matter of law.

¶ 66 Upon the facts of this case, most plans submitted by or on behalf of the Geenes show a designated area. The designated area with a measurement for encroachment upon the designated area appears to be an acknowledgement or admission of non-compliance with the formula; at the very least a serious issue was identified. In the end result the CBO has,

after consideration, ignored the designation distance issue in favour of the zoned measurement. That, in my view, was unreasonable. The designated area shown on the various plans suggests that measurement can be made. I accept that the placing of the lines to the designated areas is not precise and the placing of a line upon a sketch does not necessarily lend itself to a reliable precise measurement. That is not to say that a measurement cannot be made. It is not to say that a measurement cannot be made even if within a range. To ignore the advice of the township planner as wrong was unreasonable.

¶ 67 It was argued that provincial approval was not required for the MDS II even though MDS II is a required part of the Nutrient Management Plan. That position appears to ignore paragraph 7 of the guideline which clearly indicates that a minor variance to the MDS II can be considered in which case the municipality must consult with the provincial ministry. The guideline refers to an application and to provincial involvement. It does not follow that provincial approval for MDS II is not involved. There is no evidence of any consideration ever being made of a variance of MDS II having been considered. The fact that there was an issue of what was the proper distance to the Official Plan designated area suggests at least a consideration of a variance. The matter of variance was not raised before me.

¶ 68 It is agreed that the application of the MDS formula for the two hog barns results in a required MDS of 3,000 metres. It is further agreed that if the two barns were built one in year one and the second in year two, the resulting MDS would be considerably less than 3,000 metres. That result promotes strategic staged building. The further result is to marginalize, if not trivialize, the policy merit of the guideline. Should the guidelines ever attain the status of provincial law, the rationale for the above result might be examined. In any event, this example illustrates the guideline may be a worthwhile policy statement, but has moderate effect to create a meaningful buffer zone even if the purpose of that buffer zone is limited to the issue of odour. This paragraph gives focus to the reality that the use of the existing MDS formula deals with odour from farm structures and does not deal with the spreading of manure. The considerations of manure spreading brings into play the adequacy of nutrient management.

EVENTS OF MAY 7 TO MAY 10

¶ 69 The Nutrient Management Plan as approved was hand delivered to the township May 7. On May 8 a copy of the plan was delivered to the independent consultant. There was a communication to or on behalf of the applicants herein that a building permit would issue in three days. The building permit was issued May 10. The three days may or may not have been to May 10. The building permit was issued May 10, 2001 at 8:30 a.m. However, one calculates time, three days was very, very short.

¶ 70 The Nutrient Management Plan dated April 18 was considered and approved by May 7, involving a period of approximately three weeks. No argument was made that three weeks was not a reasonable time for that approval process to be completed. What is a reasonable period of time for an independent consultant to receive and consider the provincially approved plan even if only on a level of courtesy? A reasonable period of time is certainly to be more than three days and more than the time that the consultant had the report in hand to May 10 at 8:30 a.m. As I have found the CBO appeared to be prepared to issue a permit in any event. The forwarding of the Nutrient Management Plan to the independent consultant for meaningful contribution or even review for independent purposes was but a token gesture of compliance with any level of understanding applicable to meeting of March 27, 2001. The issuance of the permit at 8:30 a.m. on May 10 also appears to be token adherence to the holding out that there would be three days from May 7.

¶ 71 The approval by the province of the Nutrient Management Plan, being an approval signed by Mr. Hilborn, was hand delivered by him on May 7. On its face that has the appearance of being unusual. Mr. Hilborn's office was a substantial distance away from that of the township. Several hours would be required to travel the distance between the two offices. Hand delivery suggests some pressure or out of the ordinary circumstances; it appears consistent with a permit issuing at 8:30 a.m. with construction starting immediately (within 1/2 hour) thereafter. The hand delivery of approval is consistent with my conclusion that the CBO was prepared to issue a building permit in any event.

¶ 72 The building permit was issued at 8:30 a.m. on May 10. Work started within a half hour. There could have been no coincidence. It is clear that the Geenes and the builder had such a high level of expectation that steps had been taken for work to start on the date and hour when it in fact did start. There was a high level of certainty that the permit would issue when it in fact did issue. On all of the facts, the haste in issuing the permit in the short time from receipt of the Nutrient Plan approval by the province gave little time for the CBO to realistically approve the lengthy and complex plan other than in a rubber stamp way. There was no meaningful time for any input from the third party expert. In all of the

circumstances of this case, the issuance of the permit in the time frame ending May 10 at 8:30 a.m. was unreasonable.

¶ 73 I regard the township's unseemly haste between the receipt of the approved plan May 7 and the issuance of the building permit May 10 to be unconscionable. With reference to the acts of the CBO, I find his actions in that time frame to be unreasonable or worse.

NUTRIENT MANAGEMENT PLAN CONSIDERATION

¶ 74 The Nutrient Management Plan which received approval contained no actual measurement distance for MDS II. That is curious but there remains nothing in the material to which I was referred addressing that curiosity other than Mr. Hilborn taking the position it was not up to the province to approve MDS calculations. The CBO did make calculations May 9 and the calculations of that date support that the required distance measurement was satisfied. There are other aspects of the approved plan which the CBO would be required to address to assure himself that there was compliance with municipal by-laws. It is agreed that the municipality did not receive the Nutrient Management Plan dated April 18 until it was delivered by hand May 7. There was no prior opportunity to consider the plan in the context of compliance with municipal by-laws. The Nutrient Management By-law requires the plan to be prepared by a "third party certified agronomist". On the face of the plan document neither of the two parties signing the plan purport to be certified agronomists. There is no other evidence from the descriptive words used describing the business of and the persons involved with the company CropAdvisory.com or from the résumés of the two signatories supporting that they are certified agronomists. It is my conclusion that there is no evidence supporting that either one or other of the signatories are certified agronomists.

¶ 75 The meeting of March 27, 2001 may have created no binding obligation, but the CBO ascertained the identity of the "independent consultant" as evidenced by the fact that plans were forwarded to Mr. Weeden. There was created by action some level of expectation. The time permitted road roughshod over any realistic ability to have input to the process.

¶ 76 Section 4.3.1. of the present by-law deals with intensive livestock using the following wording:

> 4.3.1. Intensive Livestock Nutrient Management Plans shall be prepared by a third party certified agronomist. (emphasis added)

¶ 77 The by-law does not contain a definition of a certified agronomist.

¶ 78 The new by-law which came into effect in June, 2001 in a similar section reads as follows:

> Intensive Livestock Nutrient Management Plans shall be prepared by a third party consultant in agriculture.

¶ 79 The new by-law contains a definition of consultant in agriculture. The definition makes reference to certification "and/or recommended by the Ontario Ministry of Agriculture Food and Rural Affairs and approved by the municipality".

¶ 80 The two signatories to the Management Plan were involved in its preparation.

¶ 81 Dictionary definitions from the Canadian Oxford Dictionary of are of some assistance.

> Agronomy - the science of soil management and crop production.
> Certify - declare by certificate that a person is qualified or competent (certified as a bookkeeper).
> A third party - a party or person besides the two primarily concerned. 2 a person involved incidentally.

¶ 82 On the material before me, there is no basis to conclude that either of the signatories are certified agronomists. Mr. Hunter is a certified crop advisor. The material before me suggests that a certified agronomist is something more than a certified crop advisor, although it may be inclusive of the same level of experience, training or education. Susan Schurter does not hold herself out to be certified in any respect. Mr. Hunter, through his company, has been involved with the respondent Geene in his prior farming business. Mr. Hunter is involved in the building permit application. The intent is that he be involved in the construction of the building, that he be involved on a continuing basis with the operation of the business. He has more than an incidental involvement. He cannot be said to be independent of the parties primarily concerned in the building permit application even if that is limited to two parties: the municipality and Mr. Geene. Although the

new by-law appears to be less stringent in the designation of the party responsible for the Nutrient Plan preparation, the requirement remains for the involvement of a third party. The definition of consultant incorporates the concept of certification but with less than certification being something the municipality can accept or approve.

¶ 83 In the minutes quoted from the March 27 meeting is the expression "independent consultant". The Nutrient Management Plan by-law makes reference to plans being prepared by "a third party". From those portions of the transcript of the CBO to which I am referred he appears to accept that the consultant was to be independent of the interest of a party to the application. I agree with that conclusion. I make the fact conclusion that there is a prior and ongoing relationship between the Geenes and the signatories and/or CropAdvisory.com. My conclusion is that this Nutrient Management Plan was, as a matter of law, to be prepared by a third party certified agronomist. The test is one of correctness. The plan was not prepared or signed by a third party and it was not prepared or signed by a certified agronomist.

¶ 84 There is no material before me to suggest that the CBO referred to the by-law requirement that the plan be prepared by a third party certified agronomist or any part of the words designating in the by-law the qualification or standing of a person charged with preparation of the plan. If I am wrong in my application of a correctness standard and the standard should be one of reasonableness, in light of the plain wording of the by-law it was unreasonable for the BCO not to consider the question "Were the signatories third parties, were the signatories certified agronomists?" My conclusion is that the failure to address such questions in a meaningful way was unreasonable and an improper exercise of any discretion or deference which otherwise might be accorded to a CBO. On either a standard of correctness or reasonableness I find the actions of the CBO to be wrong.

CONSTRUCTION CONSIDERATIONS

¶ 85 From the minutes of the meeting of March 27th, reference is to the building plans being reviewed by the township's engineers. By letter dated April 12, 2001, B.W. Potter (Potter), Professional Engineer writes to the CBO indicating a response to a request to review the drawings for the assistance of the CBO prior to the issuance of a building permit. Potter's letter identified seven questions. Upon receipt of that letter, the CBO had a telephone conversation with Mr. A.W. Clark (Clark), Professional Engineer, who is an engineer with a firm who act on behalf of Mr. Geene's contractor. Mr. Clark's signature and seal were upon the drawings submitted for the building permit. On a photocopy of Potter's letter is noted that a copy was faxed to Clark and on the photocopy of the letter, the CBO notes Clark's responses or comments with reference to the seven questions raised by Potter. By letter of May 3, 2001, Clark writes to the CBO "to review the points raised" in the letter of April 12. The letter of May 3 seems to be quite superficial. All of the matters noted by the CBO in the margins of the Potter letter are not addressed in the Clark letter. The notes of the CBO are more inclusive than the letter which was intended as a letter confirming earlier discussion. Clark appeared to make a simplistic response.

¶ 86 The Ontario Building Code deals with the responsibility of a professional engineer for design and general review where buildings such as the subject of this building permit are concerned which require that construction of the buildings be designed and reviewed by a professional engineer. In such cases all plans, sketches, drawings and generally documents used as the basis for the issuance of a building permit are to bear the signature and seal of a professional engineer. The seven points in Potter's letter of April 12, 2001 address those parts of the Code to which I have just referred and, in addition, the National Farm Building Code which is stated to require that manure storage tanks be designed and constructed to prevent leakage with specific reference to Appendix A for the requirements that walls and floors are to meet a requirement to prevent leakage.

¶ 87 Potter's original questions or criticisms also deal with structural components. In subsequent examination and subsequent letter of September 17, 2001, Potter addresses issues. In particular, there is a discussion of CSA standard 22 which is incorporated into the township by-laws. Consideration of that section relates to that which was in effect in 1984 and that in effect 1994. The language differs but the approach and intent is similar in each of 1984 and 1994. In turn, there is reference to s. 14.3.4 which deals with walls greater than 10 inches in thickness and a requirement for two layers of reinforcement. The drawings dealt with one wall of 11 inches with a single layer of reinforcement. The initial floor plans were for plain concrete absent reinforcement. From the telephone conversation between the CBO and Clark there was a holding out that mesh reinforcing would be used. There is general agreement that there is a requirement this kind of manure pit construction be designed to prevent leakage. The Potter letter makes specific reference to the Code section and applicable appendix. My understanding of Potter's position is that as a professional engineer he would not have issued the building permit May 10,

2001 but he does not take the position that the issuance by the CBO of a building permit on that date was unreasonable.

¶ 88 The general contractor for the two proposed hog barns states in his affidavit that "In connection with the barns, we design them and prepared plans for them for building permit purposes. To the extent that engineering input was and is required in connection with the Geene barns, we retained the services of Maitland Engineering and, in particular, Art Clark, P.Eng., of that firm". Attached to this affidavit is a letter from Mr. Clark commenting upon evidence from an expert on behalf of the applicants. The letter is dated August 14, 2001 after the issuance of the building permit. The letter contains some comments which might fairly be termed cavalier. For example, he says: "I am not aware of the details of the township by-laws, but would assume that the Chief Building Official took them into account prior to issuing a permit." He comments further as follows:

> As you are aware, the type of barn to be constructed for Geene has developed over the years and was being built before the Code had any application to farm structures. Experience and general industry practice has guided the actual design of the floors, walls etc.
> The Code, while specifying such things as the use of CSA standards for design, also gives the Chief Building Official a great deal of latitude to accept equivalents and "allow the use of materials, systems, and building designs that are not authorized in the building code if, in his or her opinion the proposed materials, systems and building designs will provide the level of performance required by the building code." (9.-(1) Building Code Act). It seems to me that this clause in the Building Code Act says that the CBO of Huron-Kinloss was within his right to issue the building permit.
> As you are aware, farm buildings have been allowed to be designed to a lesser standard than other types of buildings. The CSA standard sections quoted by Schorn typically apply to those other types of buildings for which the code does not recognize a lowered standard.
> The industry experience and your own experience is that the building as proposed will provide an accepted level of performance. What more needs to be said?

¶ 89 The general tenor of this letter is that the CBO may make substitutes for equivalence, the inference being that it was virtually a given that such substitutes could and would be made. The "what more needs to be said" comment, I am sure the author would like to have back. It basically amounts to stating: "I have decided and I know everyone will agree." What is the purpose in my dealing with this particular subject matter? My overview of Clark's approach is that he appears to have taken what I referred to in comments with counsel as a minimalistic approach. I question that approach in a high-profile undertaking with strong emotional issues identified by the minutes of the meeting March 27, 2001. If the design had been one of over design that surely would have been to the advantage of the Geenes. I find the design to have been a minimal design.

¶ 90 Mr. Potter was critical that the plans were short of particulars or specifications but he never says directly or by reasonable inference that the plans with their notations were insufficient to render the opinion that he rendered, nor for a consideration on the merits for the issuance of a building permit. From the examination of Mr. Potter there is the following

> Okay, and the question I'm trying to get from you then, was it wrong for Mr. Farrell to issue the building permit when an engineer said it did comply, even though you differ with that engineer?
>
> A. How would Mr. Farrell know about the existence of these things? I think poor Mr. Farrell is stuck with an engineer, sends him a letter and says `I've answered all these questions Mr. Potter has, and it complies, and here's the application for a building permit'.

¶ 91 In my view, if the CBO had available to him the material and the different positions advanced before me that on May 10 it would have been unreasonable for him to have issued a building permit. Having said that, that which is before me was not material that needed to be necessarily before the CBO at the crystallized point in time. On material that was before the CBO at that time, my conclusion based upon construction issues is that he was not unreasonable in issuing the building permit. My view is that the question of reasonableness in issuing of the permit was borderline, perhaps best expressed by Mr. Potter to the effect that he would not have issued the permit, but that it was not unreasonable that it did in fact issue. I would hope with the benefit of this application the CBO would not issue a building permit in similar circumstances. I do not agree with the thesis attributed to the witness Schom that proper reinforcing would require a fresh building permit application involving new plans and specifications. There are many remedies available to a CBO which would otherwise have been available absent a fresh application with new material.

¶ 92 In my view, the standard of correctness on construction issues has been satisfied by the CBO including his making reference to the appropriate building code legislation. I find that the standard of correctness has been satisfied. I find that with reference to the facts before him that a standard of reasonableness has been satisfied on the construction issues.

WELLS,DRAINAGE TILE, SITE PLAN, BALANCING OF INTERESTS

¶ 93 The municipal requirements include the filing of plans. For example, the Nutrient Management By-law s. 5.5 requires the filing of a plan to include those things set out including the nearest drilled, dug or communal well and the location of the nearest field drainage tile. There may not be strict compliance with the by-law in that the plan filed does not deal directly with the identified requirements. But the totality of the material filed, in particular, the contents of the Nutrient Management Plan, satisfy the by-law requirements. I am satisfied that a consideration of the total of the material led to a reasonable conclusion that site plan/well location/field drainage tile location have each been reasonably satisfied.

¶ 94 In this case the proposed buildings are in a location above existing drainage tile and the plans deal with re-routing of tile. The locations of wells and drainage are not simply something to be noted on a plan for compliance in some kind of a check-list way. To have meaning, the locations of wells and tile drainage would give rise to other questions addressing whether the plan for the proposed agri business will result in adverse effects. The issues before me do not present a need for me to comment or decide any appropriate follow-up issue dealing with well and tile locations. Having said that, one would hope that there are in place adequate safeguards for water quality and the effect of drainage.

¶ 95 The evidence of Mr. Hilborn is that the provincial guideline dealing with MDS compliance is not something that requires provincial approval. This was an explanation as to why the absence of "actual" measurements in the MDS information were not material in gaining provincial approval. I think it is fair to suggest that the Walkerton experience makes one question if guidelines that do not have the force of provincial law and are not regarded as material in an approval process are good enough. At the start of these reasons I identified two interests to be balanced. On the facts of this case, I have found the Environmental Protection Act (EPA) not to be applicable law. The provincial approval officer found the MDS measurements not to be material to the approval process. These comments have little to do with the legal issues before me, but appear to have something to do with the perception or question of an even-handed balance between legitimate interests.

¶ 96 I recognize that normal farming practices are within the jurisdiction of the Farm Practice Protection Board which has its own expertise. The question remains: are there sufficient safeguards to balance legitimate competing interests? The MDS guidelines address "noise, odour and dust". The guidelines seek "to promote harmony in the rural community and to ensure agriculture as an ongoing activity". The Nutrient Management Plan addresses the type of issues that follow from such things as well location, tile drainage location and manure spreading.

¶ 97 It is agreed the plan was not in the hands of the municipality until it was hand-delivered. I have found the time permitted for the review by a third party, even if not required as a matter of law, was grossly inadequate. I find further that the time for the CBO to examine and approve the lengthy and complex plan was insufficient. I conclude that the CBO's treatment of this important document was insufficient and unreasonable. The short time supports the inference I have otherwise drawn that the CBO was prepared to issue this permit upon receipt of provincial approval of the plan without doing significantly more. He did a further MDS calculation but given his position on distance required that was but a further token gesture.

¶ 98 It is important to repeat that the MDS formula deals with building locations and "odour. MDS does not account for noise and dust." It does not deal with the spreading of manure.

¶ 99 On the facts of this case, EPA is not applicable law.

¶ 100 The CBO has a wide discretion in achieving acceptable building standards.

¶ 101 The Farm Practices Protection Board can determine normal farm practices in the context of complaints generally in regard to odour, dust or noise.

¶ 102 The balancing of the legitimate competing interests is not resolved in these reasons. The issue of balance continues and those charged with the overall responsibility would be advised to consider the following: Does the existing multi-faceted approach through different legislation, different offices, different tribunals and different levels of government balance

interests? This question involves consideration whether existing legislation furnishes a proactive approach to the balance of legitimate competing interests as compared to a reactive approach.

¶ 103 I suggest there is an appearance the playing field is not level. The competing interests before this court apply or are applicable to those having standing. There remain the interests of the broader community, and a rationalization and protection of all interests. The questions remaining are beyond the scope of these reasons.

OVERVIEW

There were strong emotional issues identified by the minutes of the meeting March 27, 2001. The CBO, by his comments as in the Fax transmission of March 19, 2001 and by the unseemly haste of issuing the building permit in the brief time span from receiving the Nutrient Management Plan approval May 7 to May 10, appears to have taken an active side in contentious issues. The issue of the building permit has the appearance of orchestration with the farmer, builder, builder's engineer and CBO. In being so overtly aligned the CBO damaged his own ability to exercise discretion. The office and decisions of a CBO are entitled without more to deference. In this case, the undermining of his own discretion also undermines entitlement to deference.

THE RESULT

¶ 104 In the result, the building permit issued May 10, 2001 for the building of two hog barns housing 4,000 hogs is quashed.

COSTS

¶ 105 Arrangements may be made through the trial coordinator for such attendance as may be required to address the issue of costs.

BROWNE J.

COUNTRY PORK LTD. v TOWNSHIP OF ASHFIELD

DOCKETC36040

COURT OF APPEAL FOR ONTARIO
CATZMAN, DOHERTY AND BORINS JJ.A.

B E T W E E N :

COUNTRY PORK LTD.

Appellant (Applicant)

- and -

THE CORPORATION OF THE TOWNSHIP OF ASHFIELD and CHIEF BUILDING OFFICIAL OF THE CORPORATION OF THE TOWNSHIP OF ASHFIELD
Respondents

Thomas J. Corbett,
for the appellant

Gregory F. Stewart,
for the respondents

On appeal from the judgment of Justice Lynn Leitch dated February 28, 2001.

BORINS J.A.:

[1] This is an appeal by Country Pork Ltd. ("Country Pork") from the dismissal of its application for an order quashing Interim Control By-Law No. 14-2000 of the Corporation of the Township of Ashfield (the "Township") passed pursuant to s. 38(1) of the *Planning Act*, R.S.O. 1990, c. P. 13 and for an order directing Mr. John Maize, the Chief Building Official of the Township, to issue a building permit to it pursuant to s. 25(1) and (4) of the *Building Code Act, 1992*, S.O. 1992, c. 23.

I

[2] On June 15, 2000, Country Pork acquired a substantial parcel of farm land in the Township with the intention of operating a large hog farm on the property. Prior to acquiring the property, Country Pork had retained Mr. Matt Ueckermann to complete the preparatory work for an application for a building permit for the construction of a 9,000 head weaner barn and an open liquid livestock manure storage facility on the property. Mr. Ueckermann was to submit the application to the Township immediately after Country Pork acquired the property. On June 16, 2000 Mr. Ueckermann met Mr. Maize and submitted Country Pork's application for the building permit. The application had not been signed by Country Pork, nor by Mr. Ueckermann on its behalf. Mr. Maize felt that he was unable to approve the application at that time, indicating that he wished to discuss certain aspects of it with the Township's planner.

[3] From the appellant's perspective, after June 16, 2000 the Township deliberately delayed processing its application by making demands for additional materials in respect to matters not required by the legislation governing the issuance of building permits. In particular, the appellant pointed to a letter of June 22, 2000 from the Township's solicitor that outlined four requirements that had to be met before a building permit would be issued, including an engineer's certificate that the proposed manure storage facility would be watertight.

[4] As a result of the of June 16, 2000 meeting between Mr. Ueckermann and Mr. Maize, the appellant's intention to operate a large hog farm and its application for the building permit were brought to the attention of the Township Council. For a number of years, residents of the Township, which is largely agricultural and which contains many livestock operations, had

raised environmental concerns arising from leakage of liquid manure from storage facilities similar to the one Country Pork intended to construct. Their concern was shared by the Township Council. Consequently, the Council held what the appellant contends was a secret meeting on June 26, 2000 at which it passed Interim Control By-Law No. 14-2000. The by-law precluded the use of any land in the Township for the establishment of a livestock facility, including manure storage facilities, with a capacity of 100 livestock units or greater. As Country Pork's proposed facility was intended to accommodate more than 100 livestock units, it fell within the prohibition imposed by the by-law. On June 27, 2000, Mr. Mai ze refused to grant the appellant's application for the building permit on the ground that the passage of the by-law prevented the issuance of the permit. On June 28, 2000, the appellant signed the application for a building permit.

II

[5] It is useful to set out the framework of Country Pork's application to the Superior Court:

(1) Under s. 25(1) of the *Building Code Act, 1992* Country Pork appealed from the refusal of Mr. Maize, the Township's chief building official, to issue the building permit and asked the court to exercise its discretion under s. 25(4) of the Act to issue the permit. Its position was that Mr. Maize was required to issue the building permit because it had satisfied the conditions of s. 8(2) of the Act before the interim control by-law was passed, with the result its application for the permit had "crystallized" prior to the passage of the interim control by-law.

(2) In the alternative, Country Pork attacked the legality of the by-law on the grounds that it was contrary to the Township's official plan and s. 6(1) of the *Farming and Food Production Protection Act, 1998*, S.O. 1998, c. 1 ("FFPA"), and that it was passed in bad faith and in breach of natural justice. This branch of the application was brought under s. 136 of the *Municipal Act*, R.S.O. 1990, c. M. 45.

[6] I would note that the framework of the application differs from the framework of the appeal which, as set out above, is framed as an appeal from the dismissal of Country Pork's application to quash the interim control by-law and the dismissal of its appeal from the Township's refusal to issue a building permit.

[7] In adjudicating the application, the application judge first considered Country Pork's appeal from the refusal of the chief building official to issue the building permit. She found that the appellant's application for the building permit had not crystallized before the Township's passage of the interim control by-law. The application judge then considered each of the grounds advanced by the appellant for an order quashing the bylaw. She found that the by-law complied with the Township's official plan, that it was not passed in bad faith, that the appellant was accorded procedural fairness and that it was not contrary to s. 6(1) of the *FFPA*.

[8] During the course of argument, the court questioned its jurisdiction to hear the appeal from the refusal to issue the building permit and the application judge's jurisdiction to determine whether the interim control by-law should be quashed. We drew the attention of counsel to s. 25(1) of the *Building Code Act, 1992*, which provides that an appeal from the decision of a chief building official lies to the Superior Court of Justice, with a further appeal to the Divisional Court "on any question that is not a question of fact alone", and to s. 38(4) of the *Planning Act*, which provides that an appeal lies to the Ontario Municipal Board from the passage of an interim control by-law under s. 38(1). Counsel assured the court that they had considered the application judge's jurisdiction to hear the application to quash the interim control by-law and this court's jurisdiction to hear the appeal on both branches of the appellant's application and had satisfied themselves that the application to quash by the by-law had properly been taken to the Superior Court of Justice and that the appeal, therefore, lay to this court.

[9] Subsequent to hearing the appeal, as the court continued to have concerns about jurisdiction, counsel were asked to provide written submissions on this issue. I have now had the opportunity to consider counsels' submissions.

III

[10] In considering the application judge's jurisdiction to hear the application to quash the interim control by-law and this court's jurisdiction to hear this appeal, it is helpful to set out the provisions of the applicable legislation.

Building Code Act, 1992, as amended

25. **(1)** Any person who considers themself aggrieved by an order or decision made by an inspector or chief building official under this Act or the regulations, except a decision not to issue a conditional permit under subsection 8(3), may, within twenty days after the order or decision is made, appeal the order or decision to a judge of the Superior Court of Justice.

. . . . .

(4) If an appeal is made under this section, the judge shall hold a hearing and may rescind or affirm the order or decision of the inspector or chief building official or take such action as the judge considers the inspector or chief building official ought to take in accordance with this Act and the regulations and, for such purpose, may substitute his or her opinion for that of the inspector or chief building official.

26. **(1)** A party to the hearing before the judge of the Superior Court of Justice under section 25 may appeal from the decision to the Divisional Court.

. . . . .

(3) An appeal under this section may be made on any question that is not a question of fact alone and the court may,

(a) confirm or alter the decision of the judge;
(b) direct the inspector or chief building official to do any act he or she is authorized to do under this Act;
(c) refer the matter back to the judge for reconsideration; or
(d) substitute its opinion for that of the inspector or chief building official or the judge.

Planning Act

38. **(1)** Where the council of a local municipality has, by bylaw or resolution, directed that a review or study be undertaken in respect of land use planning policies in the municipality or in any defined area or areas thereof, the council of the municipality may pass a by-law (hereinafter referred to as an interim control by-law) to be in effect for a period of time specified in the by-law, which period shall not exceed one year from the date of the passing thereof, prohibiting the use of land, buildings or structures within the municipality or within the defined area or areas thereof for, or except for, such purposes as are set out in the by-law.

. . . . .

(3) No notice or hearing is required prior to the passing of a by-law under subsection (1) or (2) but the clerk of the municipality shall, in the manner and to the persons and public bodies and containing the information prescribed give notice of a by-law passed under subsection (1) or (2) within thirty days of the passing thereof.
(4) Any person or public body to whom notice of a bylaw was given under subsection (3) may, within sixty days from the date of the passing of the by-law, appeal to the Municipal Board by filing with the clerk of the municipality a notice of appeal setting out the objection to the by-law and the reasons in support of the objection.
(5) If a notice of appeal is filed under subsection (4), subsections 34 (23) to (29) apply with necessary modifications to the appeal.

34. (26) The Municipal Board may,

(a) dismiss the appeal; or,
(b) allow the appeal in whole or in part and repeal the by-law in whole or in part or amend the by-law in such manner as the Board may determine or direct the council of the municipality to repeal the by-law in whole or in part or to amend the bylaw in accordance with the Board's order.

. . . . .

71. In the event of conflict between the provisions of this and any other general or special Act, the provisions of this Act prevail.

***Ontario Municipal Board Act,* R.S.O. 1990, c. O. 28**

36. The Board has exclusive jurisdiction in all cases and in respect of all matters in which jurisdiction is conferred on it by this Act or by any other general or special Act.

. . . . .

57. The Board shall not grant or issue any approval or certificate under this or any other general or special Act in respect of any municipal affair or matter, while the same or the validity thereof is called in question in any pending action or proceeding or by which it is sought to quash any by-law of a municipality relating thereto.

. . . . .

96. (1) Subject to the provisions of Part IV, an appeal lies from the Board to the Divisional Court, with leave of the Divisional Court, on a question of law.

***Municipal Act,* R.S.O. 1990, c. M. 45, as amended**

136. (1) The Superior Court of Ontario upon application of a resident of the municipality or of a person interested in a by-law of its council may quash the by-law in whole or in part for illegality.

***Courts of Justice Act,* R.S.O. 1990, c. C. 43**

6. (1) An appeal lies to the Court of Appeal from,

. . . . .

(b) a final order of a judge of the Superior Court of Justice

. . . .

(2) The Court of Appeal has jurisdiction to hear and determine an appeal that lies to the Divisional Court or the Superior Court of Justice if an appeal in the same proceeding lies to and is taken to the Court of Appeal.
(3) The Court of Appeal may, on motion, transfer an appeal that has already been commenced in the Divisional Court or the Superior Court of Justice to the Court of Appeal for the purpose of subsection (2).

IV

[11] In its submissions on jurisdiction, Country Pork advised the court that it in fact appealed from the passage of the interim control by-law to the Ontario Municipal Board ("OMB") pursuant to s. 38(4) of the *Planning Act*

on August 15, 2000, having previously commenced its application to quash the by-law under s. 136 of the *Municipal Act* in the Superior Court on July 21, 2000. By agreement between counsel for Country Pork and the Township, the proceedings before the OMB were "held in abeyance" and were adjourned pending the disposition of Country Pork's application. Although counsel for the parties, in reliance on the decision of this court in *Equity Waste Management of Canada v. Halton Hills (Town)* (1997), 35 O.R. (3d) 321 (C.A.), were of the opinion that the Superior Court and the OMB held concurrent jurisdiction to hear the application concerning the passage of the interim control by-law, they recognized that the Superior Court might decline jurisdiction. Following the release of the application judge's reasons for judgment on February 28, 2001, Country Pork launched its appeal to this court on March 19, 2001. In her reasons for judgment, the application judge made no reference to whether she had, or was assuming, jurisdiction over the application concerning the passage of the interim control by-law**.** On March 21, 2001 the OMB granted a request by the parties to further adjourn Country Pork's appeal to the Board. Thus, Country Pork's appeal of the interim control by-law remains pending before the OMB.

[12] We were also advised that on July 4, 2000 Country Pork "appealed" from the interim control by-law to the Normal Farm Practices Protection Board under the *FFPA* on the ground that the by-law contravened s. 6(1) of that Act. That proceeding was adjourned by a consent order of the Board, pending the determination of Country Pork's application. Presumably, the proceeding remains adjourned.

[13] As I understand the position taken by Country Pork, which, in substance, is supported by the Township, it sought its remedies in the Superior Court because it was the "only . . . forum that had jurisdiction over all issues" - the appeals under the *Building Code Act, 1992*, and the *Planning Act*, the application to quash the interim control by-law for illegality under s. 136 of the *Municipal Act* and the proceeding under the *FFPA* - even though the parties were aware of the possibility that the Superior Court might decline to exercise its jurisdiction to hear the *Municipal Act* application to quash the interim control by-law.

[14] From paragraphs 5 -9 of Country Pork's submissions, it becomes clear why the application judge made no reference in her reasons for judgment to whether or not she should hear the challenge to the interim control by-law. Neither party alerted her to the need to exercise a discretion in deciding whether to hear the challenge. Country Pork gives two reasons why the discretion of the Superior Court to hear the attack on the bylaw was not raised before the application judge. First, counsel relied on the "unequivocal" holding in *Equity Waste Management* that the Superior Court and the OMB have concurrent jurisdiction to hear an appeal under s. 38(4). Second, they assumed, if the application judge was of the opinion that she should not hear the application, that "on her own initiative" she would stay the appeal under s. 106 of the *Courts of Justice Act*, R.S.O. 1990, c. 43 (*"CJA"*).

[15] Both parties concede that Country Pork's appeal from the Township's refusal to issue a building permit properly was taken to the Superior Court under s. 25(1) of the *Building Code Act, 1992*, and that an appeal from that decision lies only to the Divisional Court. They contend that this court has jurisdiction to decide that appeal pursuant to s. 6(2) of the *CJA* because this court, under s. 6(1)(b) of the *CJA*, has jurisdiction over an appeal from the dismissal of Country Pork's application under s. 136 of the *Municipal Act* to quash the interim control by-law. This contention is based on the submission that there were two discrete proceedings before the application judge — an appeal under s. 25(1) of *Building Code Act, 1992*, and an application to quash the interim control bylaw under s. 136 of the *Municipal Act* — and, even though under s. 38(4) of the *Planning Act* an interim control by-law appeal lay to the OMB, that the application judge, as in *Equity Waste Management*, properly exercised her discretion to assume jurisdiction to decide the application to quash the by-law. For the reasons that follow, I do not agree.

V

[16] Earlier I referred to the framework of Country Pork's application to the Superior Court and the approach taken by the application judge in her analysis of the issues raised by the application. I did so because the position advanced by the parties on jurisdiction is based on Country Pork having sought two alternative remedies in its application: (1) an appeal under s. 25(1) of the *Building Code Act, 1992* from the refusal to issue a building permit, and (2) an application under s. 136(1) of the *Municipal Act* to quash the interim control by-law. It is on the basis of this framework that the parties say that this court has jurisdiction to hear Country Pork's appeal. This is borne out by the manner in which Country Pork has framed this appeal.

[17] Had Country Pork's appeal under s. 25(1) of the *Building Code Act, 1992*, succeeded and had the application judge issued the building permit under s. 25(4) of the Act, there would have been no need for her to consider Country Pork's attack on the interim control by-law. In such circumstances, had the Township appealed the granting of the building permit, under s. 26(3) its appeal lay to the Divisional Court "on any question that is not a question of fact alone". However, the application judge dismissed the building permit appeal and went on to consider the alternative remedy requested by Country Pork, an order quashing the interim control by-law. She refused to grant such an order.

[18] In my view, the application judge's order refusing to quash the interim control bylaw is a final order within the meaning of s. 6(1)(b) of the *CJA* and Country Pork's appeal from it properly lies in this court. Consequently, under s. 6(2) of the *CJA*, this court has jurisdiction to hear its appeal from the dismissal of its appeal under s. 25(1) of the *Building Code Act, 1992*. In considering the building permit appeal, this court is governed by s. 26(3) of the *Building Code Act, 1992*, which stipulates the powers of the Divisional Court where an appeal lies to that court. For the reasons that follow, I would dismiss the building permit appeal.

VI

[19] I will now consider whether this court should decide the merits of the appeal from the application judge's dismissal of the application to quash the interim control by-law. The starting point is whether the application judge had jurisdiction to hear the appellant's application to quash the by-law on the ground of illegality under s. 136(1) of the *Municipal Act*. The appellant argues that she had jurisdiction notwithstanding that s. 38(4) of the *Planning Act* stipulates that an appeal from the passage of an interim control by-law lies to the OMB. Both the appeal to the OMB, and the application under s. 136 of the *Municipal Act* to quash the by-law, are predominantly on planning grounds. The parties contend that she had jurisdiction on the authority of this court in *Equity Waste Management*, which they say unequivocally stands for the proposition that the Superior Court and the OMB have concurrent jurisdiction to adjudicate an appeal from the passing of an interim control by-law, with discretion resting in the court to decline to defer to the jurisdiction of the OMB in appropriate circumstances.

[20] This analysis requires a consideration of the circumstances that pertained in *Equity Waste Management*. In that case, Laskin J.A. considered the jurisdiction of the Superior Court and the OMB where, as in this case, both an application to quash an interim control by-law under s. 136 of the *Municipal Act* had been taken to the court and an appeal from the passing of the by-law had been taken to the OMB under s. 38(4) of the *Planning Act*.

[21] In *Equity Waste Management*, an application was brought under s. 136(1) of the *Municipal Act* to quash an interim control by-law on the ground that it was passed in bad faith. The parties had earlier appealed to the OMB under s. 38(4) of the *Planning Act*. However, because the Board could not hear the appeal for several weeks to the prejudice of the applicants, they decided to proceed in the General Division (the predecessor of the Superior Court) under s. 136(1) of the *Municipal Act*. Given that s. 38(4) of the *Planning Act* stipulates that an appeal from the passage of an interim control by-law is to be made to the OMB, that s. 36 of the *Ontario Municipal Board Act* vests the Board with exclusive jurisdiction in all

matters referred to it by any other general or special Act, and that under s. 96 of the *Ontario Municipal Board Act* decisions of the OMB are appealable to the Divisional Court, the respondent argued that this comprehensive scheme evidenced the intention of the legislature to vest the OMB with exclusive jurisdiction to review the validity of interim control by-laws.

[22] On behalf of the court, Laskin J. A. considered, and rejected, this argument at pp. 331-333. He was satisfied that in deciding whether to quash an interim control bylaw the OMB had the power to consider an allegation of bad faith, particularly when it is based on the absence of a planning rationale for the by-law or the lack of proper planning principles to support the by-law, and that the Board is well-suited to do so. However, he concluded that in an appropriate case the court, in its discretion, may decline to defer to the jurisdiction of the OMB and itself decide the validity of the by-law.

[23] The application judge had also rejected the argument on the exclusive jurisdiction of the OMB, concluding that "[n]otwithstanding that such an appeal [to the OMB] has been launched, the Applicants are in no way restricted from moving before the Court to quash the Interim Control By-law.": (1994), 22 M.P.L.R. (2d) 167 at 169 (Ont. Gen. Div.). Although at p. 332 Laskin J.A. acknowledged that courts should be reluctant to exercise their jurisdiction on matters that the legislature has left to a specialized tribunal with broad powers, he agreed with the application judge that in the particular circumstances of that case the applicants could appropriately invoke the jurisdiction of the court under s. 136(1) of the *Municipal Act*. He concluded at p. 333: "The [application] judge, therefore, properly exercised her discretion to hear the application on the ground of urgency."

[24] As I understand the judgment, Laskin J.A. was of the view that in the urgent circumstances of that case it was unnecessary for the application judge to defer to the jurisdiction of the OMB. Laskin J.A. found no grounds on which to interfere with the application judge's exercise of her discretion. In my view, the opinion of Laskin J.A. is relevant to the circumstances of this appeal. In particular, it is significant that Laskin J.A. concluded that the application judge properly exercised her discretion despite being satisfied that the OMB would be well-suited to consider the appeal.

[25] There are both similarities and differences between *Equity Waste Management* and this case. As in *Equity Waste Management*, Country Pork appealed the passage of the interim control by-law to the OMB and then applied under s. 136(1) of the *Municipal Act* to quash the by-law on grounds similar to those advanced in that case. Indeed, in this case the attack on the interim control by-law is predominantly on planning grounds. As for the differences, unlike *Equity Waste Management* there is no evidence of urgency, nor of Country Pork requesting an early hearing date from the OMB that the Board was unable to provide. Nor did the parties ask the application judge to exercise her discretion and to decline to defer to the jurisdiction of the OMB, and to assume jurisdiction to hear the application.

[26] As I have indicated, counsel interpreted *Equity Waste Management* to stand for the proposition that the Superior Court and the OMB have concurrent jurisdiction to determine the validity of an interim control by-law and that counsel are free to decide in which to forum to attack the by-law. In my view, counsel misread *Equity Waste Management* as giving an applicant a choice of forum in which to attack an interim control by-law, rather than as a concurrent forum case which holds that *in appropriate circumstances* the court and the OMB have concurrent jurisdiction to determine the validity of the by-law, provided that the court expressly exercises its discretion on proper grounds to decline deference to the jurisdiction of the OMB.

[27] In my view, therefore it is necessary to consider whether the

application judge should have heard the application under s. 136 of the *Municipal Act*, or whether she should have deferred to the jurisdiction of the OMB. Had she been as ked to properly assume jurisdiction, she would have had to consider the nature of the attack on the interim control by-law, as well as the legislative scheme for appeals from municipal planning decisions contained in the *Planning Act*.

[28] As to the nature of an attack on an interim control by-law, it is necessary to consider both s. 136(1) of the *Municipal Act* and s. 38(4) of the *Planning Act*, which provide the Superior Court and the OMB, respectively, with separate and distinct jurisdiction in relation to attacks on municipal by-laws. Section 136(1) of the *Municipal Act* provides the court with a limited supervisory jurisdiction to quash all or part of a municipal by-law where it has determined that the by-law is illegal, for example, as being *ultra vires* the municipality or contrary to the *Canadian Charter of Rights and Freedoms*. Section 136(1) of the *Municipal Act* is not a vehicle for consideration of the merits of a municipality's decision to pass the by-law, or whether it conforms to proper municipal planning principles. As was said by this court in *Barrick Gold Corp. v. Ontario (Minister of Municipal Affairs & Housing)* (2000), 51 O.R. (3d) 194 at 209-210: "Section 136 of the *Municipal Act* does not mandate a judicial inquiry into the merits, from a policy perspective, of by-laws or resolutions."

[29] One can contemplate a situation where an interim control by-law is based on proper planning principles but is outside of the municipality's jurisdiction and is, therefore, unlawful. In this situation, according to the analysis of the Divisional Court in *Toronto (City) v. Goldist Properties Inc.* (2002), 58 O.R. (3d) 232 (Div. Ct.), the OMB would not have jurisdiction to consider whether the by-law is a valid exercise of authority by the municipality. In *Toronto*, the court held that the OMB's jurisdiction on an appeal under s. 17(50) of the *Planning Act*, as amended, extends to determining whether by-laws should be approved on *Planning Act* principles, but does not include a determination of the validity and legality of a by-law.

[30] In *Toronto*, Blair R.S.J. held at pp. 348-349 that:

> **. . .** neither the *Planning Act* nor the *Ontario Municipal Board Act*, nor the *Municipal Act* , give the OMB a supervisory jurisdiction over the *legislative competency* of municipalities. The Board is given supervisory jurisdiction, in this context, *over their municipal planning* competence.
>
> [Emphasis in original.]

He went on to add at p. 249: "If this were not the case **. . .** there would be no need for the statutory scheme which remains in effect in relation to the quashing of by-laws and the determination of their validity." He then referred to s. 57 of the *Municipal Act*, commenting at p. 250 that it implicitly, if not expressly, requires the OMB " to stay its hand while matters relating to the validity and legality of by-laws are determined by the court".

[31] The two sections of the *Planning Act* operative in *Toronto* and in this appeal,
s. 17(50) and s. 38(4), respectively, form part of a scheme contained in the Act that constitutes the OMB as the forum for deciding whether municipal planning by-laws and resolutions conform to proper *Planning Act* principles. In creating the scheme the legislature has recognized the OMB's expertise in planning issues. In this appeal, it would be for the OMB to determine whether the interim control by-law was appropriate as supported by underlying *Planning Act* principles and the Township's official plan. Under s. 34(26) of the Act the OMB may, essentially, substitute its judgment for that of the municipality. That the OMB is the forum for the determining a merit-based attack on a municipal by-law is confirmed by s. 36 of the *Ontario Municipal Board Act* that provides the OMB with exclusive jurisdiction in relation to such matters.

[32] In my view, when the legislature provided for the OMB to rule upon whether municipal by-laws and resolutions meet the principles of the

Planning Act, it intended for the OMB to have exclusive jurisdiction to determine such questions. The OMB is a tribunal that has expertise in municipal planning. In cases where the court is asked to assume jurisdiction over matters that the legislature has assigned to administrative tribunals, there is a strong policy argument in favour of the court deferring to the jurisdiction of the tribunal in favour of protecting the integrity of administrative mechanisms set up by the legislature. Where the court is an alternative forum to a tribunal provided in a comprehensive legislative scheme, considerable judicial deference is to be given to that scheme and the expertise of the tribunal before the court exercises its discretion to assume jurisdiction. See *Ste. Anne Nackawic Pulp & Paper Co. Ltd. v. Canadian Paper Workers Union, Local 219*, [1986] 1 S.C.R. 704. Were an individual, in circumstances such as this case, free to choose whatever forum he or she wished in order to attack the validity of an interim control by-law on the grounds that it is contrary to proper planning principles, the result would be to undermine the intention of the legislature that all appeals from municipal planning decisions on *Planning Act* grounds be determined by the OMB. See, also, the policy with respect to collateral attacks on the validity of administrative orders as discussed in *Harelkin v. University of Regina*, [1979] 2 S.C.R. 561, *R. v. Consolidated Maybrun Mines Ltd.*, [1998] 1 S.C.R. 706 and *R. v. Al Klippert Ltd.*, [1998] 1 S.C.R. 737.

[33] Therefore, had the application judge been asked to exercise her discretion whether to assume jurisdiction or to defer to the OMB, it would have been necessary for her to consider the following circumstances:

. • the attack on the interim control by-law was predominantly on *Planning Act* principles;
. • unlike the attack on the by-law amending the official plan in *Toronto*, this was not “a direct frontal attack on the underlying validity and legality” of the by-law;
. • incidental and necessary to the OMB’s determination of whether the by-law should be quashed on *Planning Act* principles, which is within the OMB’s jurisdiction, it could properly consider whether the by-law was passed in bad faith and in breach of natural justice;
. • the intention of the legislature expressed in the statutory scheme in the *Planning Act* vesting exclusive jurisdiction in the OMB to review municipal by-laws and resolutions on the basis of proper planning principles;
. • the expertise of the OMB in the field of municipal planning law;
. • the policy that requires judicial deference to a statutory scheme vesting an administrative tribunal with jurisdiction to resolve disputes within its area of expertise.

[34] Given the above analysis, there is good reason to question whether the court should have heard the interim control by-law appeal rather than deferring to the jurisdiction of the OMB. As I have said, unlike *Equity Waste Management*, the application judge was not asked to exercise her discretion and assume jurisdiction to hear the appeal, whether on the ground of urgency, or any other ground. As well, there is no evidence of urgency or that the OMB had rejected a request from the appellant for an expedited hearing. As I have indicated, issues may be common on both the application to quash for illegality and the appeal on the merits, *e.g.*, an allegation of bad faith. Where the same issue, or issues, arise on both the application to quash and the appeal to the OMB, it becomes a matter of choosing the more appropriate forum according to the criteria that I have outlined.

[35] As, in my view, the proper course to follow is to decline to decide the merits of the interim control by-law appeal and to remit the original interim control by-law appeal to the application judge to determine, in accordance with these reasons, whether she should exercise her discretion to hear the appeal, I will say no more on the subject of jurisdiction. If the application judge defers to the jurisdiction of the OMB, Country Pork may, of course, proceed with its appeal to the OMB which, I assume, remains pending, or, if it is so advised, may abandon its court proceedings and proceed directly to the OMB.

VII

[36] It is necessary, now, to consider Country Pork's building permit appeal.

[37] The factual background to this appeal, in brief summary, is as follows. The appellant acquired the property on June 15, 2000. On June 16, Mr. Ueckermann met with Mr. Maize and delivered to him a nutrient management plan and drawings of the proposed barn and manure storage tank prepared by Mr. Nelson Dawley, an independent engineer retained by the appellant. Although no building plan permit application was completed at this meeting, Mr. Ueckermann deposed in his affidavit that he expected to receive the building permit on this occasion and was surprised when he did not. On June 19, Mr. Ueckermann was advised that the project would be discussed at the meeting of the Township council scheduled for the following day. Mr. Maize attended that meeting, met with council to review the nutrient management plan, and was instructed to deliver the plan to the Township's solicitors. On June 21, Mr. Ueckermann spoke to Mr. Maize, who indicated that a certificate was required from Mr. Dawley stating that the storage tank would be watertight. On the same day, Mr. Maize wrote to Mr. Dawley's firm, Dawley Engineering, setting out the requirements of the certificate. On June 22, Mr. Murphy, the Township solicitor, outlined in a letter to the appellant's solicitors the requirements that had to be met before a building permit would be issued. They were:

- that the appellant provide the required certificate from Mr. Dawley;
- that a development agreement be entered into as required by the Township bylaws;
- that a signed application for a permit be submitted, together with the necessary fee; and
- that the nutrient management plan might have to be reviewed by an independent consultant.

On June 26, the Township passed the interim control bylaw. On June 27, Mr. Ueckermann was advised about the passage of the interim control bylaw. On June 28, the appellant signed the application for a building permit.

[38] Before the application judge, the appellant took the position that it had complied with all applicable legal requirements by June 19, and was entitled to its building permit on that date. The Township's position was that the building permit could not be issued because the appellant's application was not made until June 28, two days after the interim control bylaw was passed.

[39] In her reasons for judgment, the application judge made the following findings with respect to this issue:
